The Grand Canal Museum

Hongkai Ma
Grand Canal Museum, Liaocheng, China

State of Knowledge and Current Debates

Introduction

This essay takes a case study of the Grand Canal Museum in Liaocheng, China, as a way of highlighting the great value that China places on museums and on the cultural heritage of the country. The Grand Canal Museum is the first large-scale thematic museum with the canal culture as the theme; comrade Fei Xiaotong, the famous sociologist, anthropologist, ethnologist, social activist, and former vice-chairman of the NPC Standing Committee, bestowed the name on the museum (Fig. 1).

The museum, located on the east side of Water City square on the north shore of the Dongchang Lake, was built in November 2004 and subsequently opened to the public in May 1, 2009. It was built to collect, protect, and study all facets of canal culture while also displaying the natural features and ancient history of the Chinese Grand Canal.

The museum has an area of 12,000 m^2, with an exhibition area of 6000 m^2, covering five floors, one of which is located underground. It is divided into three functional areas: an exhibition area, a collection area, and a research and academic exchange area. The museum's message is that "Canal history can change our lives." In addition to the entrance hall, there are ten exhibition halls. Located on the first floor, there are three exhibition halls dedicated to Liaocheng City's government's tenth anniversary of the museum. On the second floor, three exhibition halls are dedicated to a canal culture exhibition. On the third floor, three halls are provided for historical and relics exhibition on Liaocheng, and the fourth floor hosts rotating temporary exhibitions (Fig. 2).

Situated in the lobby of the Grand Canal Museum is a large electronic sand table reflecting Liaocheng City's landscape. This provides a more intuitive understanding of Liaocheng City and its unique structure. The ancient city is like an ark, floating in clean water, leading to a common saying: "Water is in the city, water surrounds the city, water is the city."

The Exhibition of Canal Culture

The cutting of canals allows for rivers to connect to oceans, remote peninsulas, and isthmuses becoming frequent routes of travel for bodies of water. Canals are therefore a great fruit of human brightness and an important mark of the civilization of human society. Throughout civilization, canals have always had an important part in benefiting local people with economic prosperity and social progress in the region. The creation of the canal narrowed the distance between economic and cultural exchanges, driving the rise of the urban, economic, and cultural belt. In the canal museum, exhibition of canal culture

The Grand Canal Museum, Fig. 1 The Grand Canal Museum, Liaocheng, China

The Grand Canal Museum, Fig. 2 Electronic sand table reflecting Liaocheng City's landscape

includes three exhibition halls: "The World Canal Exhibition," "Chinese Canal Exhibition," and "Liaocheng section of Chinese Canal" (Fig. 3).

The World Canal Exhibition

Early in the nineteenth century BC, Egypt built a canal connecting the Nile and the Red Sea. Subsequently, with the development of shipping

The Grand Canal Museum, Fig. 3 Introduction to the most famous canals

technology and the increase in trade volume, some European countries accelerated the excavation of canals. The sixteenth century to eighteenth century was the high-speed period of European canal construction. The second half of the eighteenth century to 1870s saw an increase in capacity and volume, as the original canal was no longer able to meet the transportation needs. The most famous canals are the Suez, Kiel, and Panama Canal. Canals of different countries however serve different functions and therefore have different styles. The exhibit displays a map and list of canals worldwide. On this list, the Chinese Grand Canal is recorded as the earliest and longest canal ever created (Fig. 4).

Among the currently existing canals, the Grand Canal occupies the most prominent position in the human history of canals. The exhibition design makes extensive use of Chinese elements, such as the traditional painting scroll rendering. This shows that Chinese people are full of yearning and have great expectations for China's Grand Canal. Additionally, there is also a yacht simulation cockpit that travels from Alexandria, the United States, via the Suez Canal traveling to the Red Sea, Indian Ocean, the Malacca Strait, the South China Sea, East China Sea, and Beijing-Hangzhou Grand Canal, and then finally arrives in Beijing, the capital of China. In this magical journey of the canals, it allows you to fully understand the different customs and historical changes of the world canals and the cities along the canals.

Chinese Canal Exhibition

This exhibition hall includes five parts: canals in the early stages; the Sui and Tang Dynasties' canal; the Song, Jin, and Yuan Dynasties' canal; the Ming and Qing Dynasties' canal; and finally the modern day canal.

The Chinese Grand Canal was built in the Spring and Autumn period, formed in the Sui and Tang Dynasties and flourished in the Ming and Qing Dynasties. It was one of the greatest monuments in the history of Chinese water conservancy projects and played an important role in China's political unity, economic development, and cultural prosperity. During the excavation and utilization of the canal, China's working people created rich material and spiritual wealth, forming a unique canal culture. Additionally featured in this hall is an electronic sketch map of changes in the Grand Canal during the Sui, Tang, Yuan, Ming, and Qing Dynasties, so we can identify the progressive changes in China's Grand Canal.

Canals in the Early Years

During the Spring and Autumn period of the Warring States, princes fought for hegemony creating war over many years. In order to facilitate efficient military transportation, Wu, Chu, Wei, Qi, Qin, and other countries successively cut the canal. In 494 BC, Fu Chai, King of Wu, obtained victory in the war with Yue and enslaved Goujian, the King of Yue (Fig. 5). Yue begged for peace with Wu, and Wu promised Yue that Yue could be Wu's ally. Sometime after this event, Fu thought that Yue was no longer a concern and therefore

The Grand Canal Museum, Fig. 5 Fu Chai, king of Wu during the Spring and Autumn period

only wanted to fight for hegemony with Qi. However, the distance to Qi was vast, roads poorly maintained, and the transportation of food and weapons too labor intensive and costly to do so over land. Wu had advantage in its boat division, advanced river shipbuilding and shipping technology, but had no waterway between Jiang and the Huai rivers (Fig. 6).

The Grand Canal Museum, Fig. 6 Qin Shi Huang, first emperor of Qin Dynasty

In 486 BC, Wu decided to use the natural conditions of the rivers and lakes to measure and excavate locally and connect several lakes. From that point onward, the Yangtze River and the Huai River were linked. In the *Commentary of Zuo*, the ninth year of Duke Ai, he states "Wu built a city in Han, which connected Jiang and Huai rivers." Because Han City is the canal's starting point, it is called the "Hangou Canal." When Emperor Yang of Sui cut the Grand Canal in the North Jiangsu section, he adopted the name Hangou Canal. Three years later, Wu had dug He water, which connected Yishui and ancient Jishui. In the tenth year of Emperor Hui of Wei (361 BC), Wei opened the gap from the Yellow River to the Huai River, fundamentally forming the rudiments of early Chinese canals.

The exhibition showcases pottery as the earliest form of Chinese wine vessels with lateral bodies, cup-shaped mouths, and upper ends spiked with visual similarities to that of a small boat. On both sides of the abdomen is a fishnet pattern symbolizing a boat finished fishing and drying its nets. The upper two shoulders of the earthenware pot are transversely provided with two bridge-shaped small ears, which are convenient for carrying while also allowing it to be carried by a rope.

After the Qin Dynasty unified the whole country, it opened the Ling Canal which connected the Hunan and Li rivers and connected the Yangtze River and the Zhu River, becoming a crucial river in the south of China. The Western Han Dynasty, Martial Emperor, excavated Cao Canal which spans from Chang'an to Tongguan, while the Eastern Han Dynasty dredged and governed the Bian River.

The Eastern Han Dynasty, Cao Cao, excavated Baigou, Ping Lu, Li Cao, and Suiyang canals and others, forming a north-south waterway in the Hebei plain.

Cao Cao was not only an outstanding statesman, military strategist, writer, and poet but also an outstanding water expert. In particular he ordered digging in Shandong Province, which had a very important position in the history of the China's canals, allowing for an indelible contribution to the North-South Grand Canal. This exhibition showcases a statue of Cao Cao digging the river, fashioning pottery ink stone, tiles, and mirrors that reflect the culture from this time period.

When Wei was founded, it continued to maintain the territory of the canal. The Sun Wu regime, in addition to using the Yangtze River and Taihu water conservancy, also dug the Pogangdu Canal and renovated the Jiangnan Canal. The Eastern Jin Dynasty and the Northern and Southern Dynasties and the southern political capital Jiankang roughly followed the waterway development system of the Sun Wu era plan, while in the Northern Wei the canal roughly followed the Wei canal layout.

During this period, the primary focus of canals was military based, which is emphasized by a picture of three battles on display in this hall.

The Sui and Tang Dynasties' Canal

The formation, and the most important stage, of the Grand Canal was excavated by Emperor Yang of the Sui Dynasty, in order to consolidate national unity and better control the Jiangnan

area. The rich resources of the Yangtze River Delta region were controlled by the central government, and due to the dependence of the Sui Central government on the economy of Jianghuai, the Sui Central Committee and the Emperor ordered the cutting of the Grand Canal.

In 604 AD, Emperor Yang Guang left the capital Chang'an to travel to Luoyang to inspect the creation of the canal. In 605 AD, he proposed the two major projects regardless of official opinions: first, that the capital be moved from Chang'an to Luoyang and the second to recruit millions of migrant workers, to be overseen by the outstanding engineering expert Yuwen Kai, to cut the Grand Canal, and to open the Tongji and Yongji canals. Emperor Yang ordered workers to commence creation of the Grand Canal in 605 AD.

The Tongji ditch was dug in 605 AD, dividing Luoyang into two sections. The western part included the suburbs of Luoyang from the Luo River and Valley into the Yellow River. The eastern part included Sishui, Xingyang, the Yellow River, the river by the water (the original Huaihe tributary), and Shangqiu, Suxian County, and Si County into the Huaihe River.

The Yongji ditch was dug in 608 AD. Navigation to Tianjin was enabled subsequently, using the Qin River, Qi water, and Wei River water and following the Yongding River to Zhuo County (now Beijing).

In 610, the Jiangnan canal was opened, spanning from Zhenjiang to Hangzhou, stretching over 400 km. This allowed more readily available travel via boat to any city connected to the canal.

Luoyang as the center, at this point in time, connected through the Han ditch and the Jiangnan River and connected the Haihe, Yellow, Huai, Yangtze, and the Qiantang rivers. North of Zhu County (now Beijing), Yuhang (now Hangzhou), the main waterway is 2700 km long, and communication between the north and the south and the east and the middle of the water transport arteries had been formed.

The Luohe River, located in the Luoyang basin, is of special significance as it is the most important transportation hub and is the royal river and the millennium ancient capital of Luoyang.

In the first year of the reign of Emperor Wu Zetian (701 AD), she set up a new pool in the south of Luoyang. "All the boats of the world are collected, and there are more than ten thousand vessels in the world."

As a result of the Grand Canal navigation, it facilitated the communication and exchange of northern and southern Chinese economy. The prosperity and economy in the coastal cities along the canal gradually formed Suzhou and Hangzhou, Zhenjiang shipbuilding industrial bases, and Wuxi, Yangzhou, Jiangdu, and other important foreign trade port cities.

The Song, Jin, and Yuan Dynasties' Canal

After the opening of the Jizhou River, boats could sail from the Yangtze River to the Yellow, Si, and Jizhou rivers and then go straight to the bottom of An mountain. Two water trade routes existed from north of the Ji River to Tianjin: the first route, traveled through the Gulf of Bohai to Tianjin and then into the sea, and the second from Dong'e dry station (North Dongping, and from north through Linqing) to the Jinwei River. The transportation of the latter route is more difficult during the summer seasons. Therefore, in 1289, goods traveled along the Jizhou River north through Shouzhang, Liaocheng to Linqing, and the Huitong River, a distance of 250 km, finally connecting to the Wei River. The Huitong River being located along a dividing ridge between the Huai River and Wei River resulted in the building of 26 lock plug plates on the Huitong River and a water tank in Ji'ning, to control the water level. As a result, the Huitong River is also referred to as the "river's gate." After completion of the Huitong River controls, transportation was then possible through the Jizhou, Huitong, and Wei rivers through to Tongzhou. During the years 1291–1293, the Yuan Dynasty dug the Huitong River from Tongzhou to Dadu, and since then, ship transport by Tongzhou to the Tonghui River would then terminate at Beijing City. During this period of time, today's route of the Grand Canal was formed.

The Ming and Qing Dynasties' Canal

The Ming Dynasty moved the capital to Beijing, based on the layout of its canals in the Yuan

Dynasty. While renovating the Huitong, Zhongyun, and Liyun rivers, additions were made in connecting the Nanyang and Jia rivers to the network. During the 24th year of Hongwu (1391 AD), the Yellow River burst its banks, resulting in Huitong River silt waste. During the 9th–13th year reign of Yongle (1411–1415 AD), the Court adopted Bai Ying's proposal to build the Daicun Dam above the Wen River, to allow the water to flow to Nanwang Lake. Nanwang Lake, located in the middle part of Si and Wei rivers, was propagated on high terrain, known as water ridge. Once water was led to the Nanwang Lake, it was controlled by two gates, to separate the water to the north and south. The amount of water flowing northbound is roughly seventy percent, with southern stream accounting for the remaining thirty percent, resulting in the phrase "seven points toward the emperor, three points to Jiangnan." During this period, they also built 38 gates, to resolve water flow issues on the Huitong River (Fig. 7).

The Qing Dynasty maintained the Ming Dynasty's canal, and river at great expense, so that the Grand Canal and water transport would enable prosperity. From the electronic map of the canal in the Qing Dynasty, we can see that 12,000 km of the north and south Qing Dynasty Grand Canal is not smooth sailing. This is due to the terrain, creating a different flow to the water. Water flows from Beijing to Tianjin, from Nanwang to Tianjin; Nanwang to the Zhenjiang section, from Tianjin to Zhenjiang; and from Hangzhou to Yangzhou. In order to solve the problem of different water flows and water levels, some high-tech water conservancy projects were applied to canal governance. There is a group of canals with a complimenting sand table, seen across the Haihe, Yellow, Huai, Yangtze, and Qiantang rivers. The relationship between the water and sand table is complex and unique, particularly between the canal and Yellow River in different places.

The Nanwang Water Sand Table on the river's wall is a high-tech water conservancy project created by Song Li of the Ming Dynasty and Bai Ying the water expert. It played an essential role in the historical science and technology of water conservancy in China and the rest of the world. After the Grand Canal north from Beijing and

The Grand Canal Museum, Fig. 7 The floating bridge

south to Ningbo opened, the narrow coast along the canal had created China's most affluent economy, concentrated supplies, and formed the largest populations and developed areas of transport. In the absence of the modern transportation era, the rise and fall of coastal cities on the Grand Canal was linked to the accessibility of the water system of the canal. The Ming and Qing Dynasties in particular benefited, with the enhancement of the canal economic functions and prosperity of commodities, resulting in commercial cities appearing on both banks of rivers. There were more than 30 emerging commercial cities in China during this period, most of them distributed along the Grand Canal.

Important Individuals to the Grand Canal Displayed above is a group of Ming Dynasty flood management character statues; in addition to Bai Ying, they are all the officials who managed water in the Ming Dynasty. They all made great contributions to the Ming Dynasty's canal and conquered many difficulties during the process, creating historic miracle of the canal that we see today (Fig. 8).

The leftmost statue is Song Li (1359–1422), who is known for the opening of the Huitong River, rebuilding the Bay of Wenshui, Nanwang water diversion, Wei County, Qingping City (now is Linqing City) flood engineering, and many other projects.

The statue besides Song Li is Pan Jixun (1521–1595), born in Wucheng, Zhejiang (now Huzhou City), the famous water conservancy expert of the Ming Dynasty and department minister. During the 44th year of Jiajing to the 20th year of Wanli (1592), he managed the river on four occasions over 10 years. In treating of the relationship between the Yellow, Huai, and Yun rivers, he proposed the principle of "Through the river, the river is governed by the canal, and the canal is cured by the river. The Hui and Huai rivers flowed into the sea and that is the governance of the sea by the rivers." In dealing with water and sediment, Pan Jixun put forward the "river to river, water attacks sand" policy. Additionally, during his career, he wrote "Two Rivers," "Defense at a Glance," and many other books, which elaborated his strategy and experience in the river, stipulating that the rivers and canals have had a profound impact on many facets of life.

Bai Ying (1363–1419) is a famous peasant expert in water conservancy in early Ming Dynasty. Bai Ying is known as the "old man" who lived by the canal. The reference to "old man" doesn't mean an elderly person but the

The Grand Canal Museum, Fig. 8 Ming Dynasty flood management character statues (Song Li, Pan Jixun, Bai Ying, Xu Youzhen, Liu Dongxing)

senior leader of a group of more than ten canal works. This is also in part due to his vast water management and sailing experience and experience with the territory of the Grand Canal in Shandong Province. After Song Li failed in the governance of the Huitong River, he went to the North of Wenshang City to seek a positive strategy where he then met Bai Ying.

Bai Ying, accounting for the terrain and hydrological Huitong River, proposed six methods of training. As Wenshui was the water source, an embankment diversion caused the water in the canal to flow to the highest elevation of the South Wang and then diverted to the north and south, to resolve the problems of water shortage. Song Li adopted the proposal of Bai Ying and organized construction in accordance with drawings designed by Bai Ying. After 9 years of hard work, they completed the water conservancy project in the Ji'ning canal. Rivers were interlinked, multiple canals connected, and lakes dependent on one another merged into a combined water system. Due to the success of Bai Ying's governance of water, commerce was established in the Ming and Qing Dynasties, for 600 years, allowing for the highest annual grain transportation of 25 billion kg. This effectively promoted the economic and cultural development and social stability in the Ming and Qing Dynasties, earning the respect of the people.

Xu Youzhen (1407–1472 AD) lived in Wu County (present Suzhou City) known as the successful candidate during the highest imperial examinations at the eighth year of Xuande. Despite his smaller stature, he was wise and knowledgeable in astronomy, geography, art, and water works, with a desire for betterment. In the third year of Jingtai (1452 AD), Xu was promoted to a higher position, at the time the Yellow River had been in a sand bay for 7 years and poorly governed. The group officials unanimously recommended Xu to govern the river. Subsequently, he was promoted to the left of the imperial, who were responsible for the management of the river. After detailed investigation on his domain, he put forward three measures of water sluice: expenditure flow, dredging the canal, and actively organizing a large number of migrant workers. He personally oversaw the project construction, finally eliminating the long-standing water problems.

The Function of the Grand Canal In this area, the museum created a model of the Grand Canal on its floor space. It twists and turns, symbolizing the peaceful flow of the Grand Canal. It displays 35 major cities along the Grand Canal for their historic sites and featured on an electronic sand table.

In addition to political and military functions, the digging of the canal to a great extent affected the economy and transportation heavily. The transportation by waterway also transports the land tax of levy grain to the capital or designated locations. In Qing Dynasty, tax collection provinces include Shandong, Henan, Hunan, Hubei, Jiangsu, Jiangxi, Anhui, and Zhejiang. In the Qing Dynasty, salt, water transport, and river were known as the "three policy," which are three of the most important affairs of the nation.

Transport ships traveled to the north, flowed through the Yangtze River, and across the Yellow River, where there are several large lakes to the south of Huai'an. These ships would face the danger of overturning when they met storms, or fast flowing rivers. To prevent accidents due to overloading, the government limited the water capacity of the ship, established a building of wear observations, and directed the ship's transportation behavior. In addition, facilities such as lifeboats were added.

The departures of large transport ships were the cause of busy canal activity and food transport difficulties. In ancient times, there were hundreds of ships on the canal, and the transportation of grain, coal, timber, agricultural products, and commodities were by ships. As such, trackers played a key role in this process, bending forward with a stiff rope and a limping gait. Many trackers wore no clothes, despite seasonal weather changes.

But why?

That is due to many trackers being from poor families, clothing having very low durability, and the need to frequently dive into water with little or no notice. If they wore clothes and proceeded to get

The Grand Canal Museum, Fig. 9 Boat trackers

in and out the water, it was not only inconvenient and heavy but also made it easier to get rheumatoid arthritis, etc., so they chose to be naked.

In the cold winter, once the boat had been laid low, you could look at the shore and see a neat little line of trackers with some stiff ropes, communicating loudly to one another. While the river wind was wrapped in snow and ice, and the situation was difficult for most people, the tracker however took this for granted with his seasoned experience (Fig. 9).

Transport ships arrived at Tongzhou warehouses, and the public lottery decided where the grain was transported to from there. This was in accordance with the grain, as they had to lay down the grain in the earth dam. After the transport ship arrived at the dam, inspection began to check whether the grain was clean or not. At the time of unloading, it would then be sent to the warehouse, to allow for the central government to perform additional checks. The entire year's work for the warehouses would be completed when grain had been successfully transported to Beijing's warehouses by canal.

The books in the display room showcases are all related to cultural relics of grain transportation relating to the canal. Most of them are the Ming and Qing Dynasty's imperial palace hidden files, decorations of the first historical archives of China, and state administration of cultural heritage. Included are the regulations of the Qing Dynasty, which are the discipline of the inner secrets of the Cao group and similar to the constitution of our present association.

There is also a photo depicting Qing Dynasty's "Commissary agency operator fan." From the beginning of the Ming Dynasty, it was widely used in water transport on the canal. This is a close kept secret, created by a military agent, and as such outsiders are not allowed to read it. Records of fan were maintained on each grain shipment and etched on a label in the grain stipulating the military grain broker that inspected the grain so that in the future if something goes wrong with the shipment, they would know who is responsible.

In front of the following photo, there is an infographic of a Dou, an important instrument for the collection of cao grain at that time. This was the official standard weighing apparatus, equivalent to five fights, which is about 75 jin (Fig. 10).

The ship was the pride of the canal, and the canal's contribution to humanity was reflected by the ships that sailed north and south. Busy shipping was not only a sign of economic and traffic

The Grand Canal Museum, Fig. 10 Dou, a measure tool for grain

development but also a symbol of canal culture. The display case in the museum shows the ship model of Song, Ming, and Qing Dynasties.

The canal not only promoted the development of the urban economy but also brought about cultural prosperity. Many would say that the Grand Canal is like an encyclopedia of Chinese culture. Its cultural connotations are rich, profound, and vivid. During the Ming and Qing Dynasties, the civil economy and the accomplishment of the canal zone's commodity economy presented unprecedented prosperity, a significant increase in the size of the market along the Yuncheng trade, and bolstered rural town market activity (Fig. 11).

The prosperity of the commercial economy had enabled the urban handicraft industry to also develop rapidly. This was particularly the case for cotton silk textiles, printing, dyeing and printing, embroidery, gold and silver foil, iron wood lacquer, bamboo weaving, food processing, and brick kilns. The scale of production and trade were ranked among the top nationwide. During

The Grand Canal Museum, Fig. 11 Papercut

the late Ming Dynasty, some of the handicraft industries also had the emergence of capitalist production relations.

Arts and Crafts Above are some arts and crafts from the cities along the Grand Canal. In commodity-economy-developed cities along the canal, craftsmen produced various kinds of exquisite handicrafts and many distinctive works of art, such as papercut of Liaocheng, Yangzhou lacquerware, Huai'an's bronze, Wuxi clay figurines, Suzhou fans, pictures about Tianjin, tapestries of Hangzhou, Changzhou comb gas, Shaoxing's blue prints, and many more (Fig. 12).

With the prosperity of the commodity economy along the canal, and the rise of the civil class, novels and plays were adapted to the public interest and vigorously developed. The four famous Chinese classics and the famous three words of the Ming Dynasty were born on the side of the canal.

The prosperity of the canal also allowed Chinese religions to spread, from south to north. This included Buddhism, Taoism, Islam, Judaism, Catholicism, and Christianity, resulting in many religious buildings to be constructed alongside the canal.

Today's Canal

The opening of the canal gave the southeast coastal area a more direct connection to the

The Grand Canal Museum, Fig. 12 Dongchang clay sculpture

whole country. In particular, the development of the canal made it a frontier region of sino-foreign economic and cultural exchanges. China's neighboring countries, Asia, Europe, and East Africa, established commerce to China, conducting frequent economic and cultural exchanges. North Korea, Japan's policymakers, monks, Italy's Marco Polo, and the French's Brooke in particular left meaningful footprints along the canal in China (Fig. 13).

The ancient Chinese Grand Canal still plays a huge role in the local economy to this day, benefiting flood control, irrigation, water supply, and tourism, despite the northern part of the canal having been broken. The implementation of the eastern route of the south-to-north water diversion project, and the application of the Grand Canal in China, will enable the Grand Canal to undertake the task of revitalizing the north portion of the Grand Canal.

In May 2006, the state council officially unveiled the Grand Canal as a national cultural relic and tasked a unit with its protection. In 2006, 58 members of the national committee of the Chinese People's Political Consultative Conference (CPPCC) requested restoration of the Grand Canal. At the end of 2006, the state administration of cultural heritage created a new list of China' s world cultural heritage, stipulating the Grand Canal as the first project. The state administration of cultural heritage decided that the Grand Canal cultural heritage project would be submitted to UNESCO in 2013 to officially declare it as world cultural heritage (Fig. 14).

Currently, there is a plan for a south-to-north water diversion project. The planned canal through the Yellow River will be in Liaocheng. When this happens, the water of the Yangtze River, flowing under the Yellow River, will become another spectacle on the Grand Canal.

Liaocheng Section of the Chinese Grand Canal

The Liaocheng section of the Chinese Grand Canal exhibition details the excavation, governance, economy, and culture in the Liaocheng area.

The canal and the Huitong River flowed through the hinterland of Liaocheng during the Yuan Dynasty, bringing with them historic development opportunities to Liaocheng. During the Ming and Qing Dynasties, Liaocheng, Linqing, and Zhangqiu became important commercial ports along the canal. "The boat was like a cloud, and the sails can cover the sun." In

The Grand Canal Museum, Fig. 13 The Chinese Grand Canal introduction

The Grand Canal Museum, Fig. 14 Kublai Khan, the fifth emperor of the Yuan Dynasty

G

particular, Liaocheng was known as "the throat of the Cao river, the elbow of the capital" and "a metropolis of the north of the Yangtze river."

Excavation

The excavation of the Liaocheng section of the canal began in the Yuan Dynasty. The Yuan Dynasty government, under advisement of Minister Han Zhonghui and official Bian Yuan, dug up the Huitong River from Mount Anshan to Linqing. This would then be named by Kublai Khan. This pass-through river is the ancient canal that runs through the Liaocheng district. From this point onward, boats would come from the south by water to Beijing (Fig. 15).

In the example above, the pair of animals resembling tigers or lions is a variety of dragon. They were situated on the wild goose wing in the canal, then moved to the Liaocheng Park for protection, and then finally situated in this exhibition of the museum. The function of this pair of animals was to overcome the arrogant "water monster" under the bridges, preventing the halt of water flow and avoiding water damage. During the construction of ancient bridges and dams, they would often be placed on the column's head or goose wings.

Most of the old photos beside these statues on display were taken in the 1930s and 1940s, showing the edges of the canal wharf, city, sails, and buildings by the canal. Most of the images reflected in the photos are now nonexistent.

During the ninth year of Yongzheng (1731 BC), the repair of the city's census records was undertaken by Deng Zhongyue, the Scholar of Liaocheng, including a detailed population account of 4.5 million during the Ming and Qing Dynasties. "There are more than 100,000 families in the city, it can be seen from the smoke from the chimney."

Featured on the exhibit's wall is a scene of Kublai Khan naming the Huitong River, displaying Kublai Khan's control of the canal and the reconstitution of the country. Due to a lack of water and the land disparity in the canal's section of Liaocheng, it was often affected by flooding from the Yellow River resulting in a much more difficult task. The Zhangqiu section in particular was a targeted area of restoration by the government. Both Xu Youzhen and Liu Daxia were sent there to control the river and achieved great success.

Governance

In front of Kublai Khan's scene is a sculpture featuring Liu Daxia's management of the canal.

The Grand Canal Museum, Fig. 15 Beasts for flood suppression

Liu Daxia (1436 BC–1516 BC) was born in Huarong, Hunan. During February in the sixth year of Hongzhi (1493 BC), Liu was endorsed by his peers to manage the river. When Liu Daxia exclaimed that: "the ancient river management was to protect the people, but today, the river management policy is to ensure the smooth transportation of grain." After taking office, Liu formulated a strategy for means of transportation through the river. This entailed diverting water to the south, opening the Zhangqiu canal and the dam of the north bank of the Yellow River. In order to solve the difficulties of Liaocheng's lack of water, Liu created a large number of water conservancy facilities, including dams and embankments. Overall this played a decisive role in the success of the river's control and guaranteed the transport of the canal for more than 400 years.

Liaocheng's Tongji sluice's function was to adjust water level differences, allowing smooth sailing by boat. Entrance and exit points of the docks on the moon river (also known as Yue River) were excavated due to the canal being too narrow. The end result was a more convenient transportation and loading of goods, resolving traffic jams and allowing other ships to carry on to the new canal. The moon river's canal functionality is seen by some as a precursor to today's emergency parking area on highways.

The weir dam was another innovation in the canal water project acting as a buffer that could be built for the balancing of water levels. There are two types of dams along the canal, "hard" dams and "soft" dams. The construction and use of hard weirs and soft weirs were for the various terrain types along the canal.

The Huitong and Wei rivers in Linqing south gate mixed when the water in Wei River was torrential, pouring down the canal when the water was slow, resulting in the level of the canal being higher than the Wei River. During the year of Wanli, Wan Gong proposed building an earth dam on the canal's interchange of Hui and Wei, creating a board shaped like a gate that could move up and down, to be closed at any time. When the gate was lowered, the dam can be used to hold water so that when the canal was opened, the water wouldn't flood into the boat. It was also used to prevent the water from flooding the canals and damaging the embankments. Sometime after the dam's creation, the dam was upgraded to stone, and later in the Qing Dynasty, ships would be dragged through the dam's crest and into the canal or the river as a point of initial entry. The Linqing River's entry is through the dam's engineering sand table, which is based on historical materials and photos.

The group of iron anchors was collected during the survey of cultural relics along the canal, having been used on the Liaocheng canal during the Qing Dynasty. The location of Liaocheng's canal section is special, due to its easier navigation; the transport ships in Liaocheng canal were relatively small, resulting in the ship's anchors being smaller.

The breakthrough of the Huitong River made Liaocheng a bustling port city, stimulating its commerce. "Liaocheng is taken for grain transportation accessible, the ships from south had an endless stream." The transportation in and out of the city was busy along both sides of the canal, with many companies and shops lining the canal. In the commercial street of Liaocheng, Dongguan, the scene along the canal consists of wharf monuments, duty-free shops, a public hall, and streams of many people busily coming and going. The scene focuses on such scenes as Hengchang drugstore, Yongsheng carbon store, Jin Kuidan shop, public trust cloth shop and other famous trade and exhibition halls and public places.

The duty-free tablet in front of the wharf is 4 meters high, it was originally built on the south bank of the west canal of the southern power plant of Zhakou, Liaocheng south power plant. There is also a well-known legend in Liaocheng.

There was also a well-known legend in Liaocheng. It was said that during the year of Kangxi during the Qing Dynasty, the Ministry of Law Assistant Minister Ren Kepu returned to his hometown and lived in the "Qi Yuan garden" in the north of Dongchang City. When he was an official in Beijing, he was actively involved in government affairs and was highly valued by the Emperor. Eventually he returned to his hometown, as he wanted to live in peace. However,

his hometown of Dongchang was flooded. Starvation and drought clasped itself over the town, resulting in the abandonment of babies, selling of women, and even the slaughter and consumption of other people. The officials of Dongchang didn't report the city's circumstances and continued to collect all kinds of exorbitant taxes, causing much complaint among the public.

To save the people, Ren reported the heavy disaster to the Emperor three times, asking for tax cuts and relief for the victims, but he did not get the reply. Ren became very anxious and nervous.

One day, Ren asked his family, "Is there a letter from the court?" The family replied: "I just received a letter from Beijing and now it is in your son's hands." "Go get it," he said. "I want to read it." When the family received the letter, he looked it over; however it was just a memo from a colleague. He felt a great disappointment and sighed, but a line behind the letter caught his attention. It read: "Emperor Kangxi will visit the south of the canal soon, and he will pass by Dongchang." When he saw this, he immediately turned his head and said, "Well, God helps those who help themselves!"

Ren had figured that if the first few times he had attempted contact had failed, this upcoming visit from the Emperor would be ideal. He also thought that if the Emperor believed in destiny, it would be a good idea for him to permit a tax reduction of his hometown, relieving his people's suffering.

On the day of the Emperor's visit, the long-expected dragon boat of Kangxi finally came to Dongchang. The officials of Dongchang lined up and knelt to meet the dragon boat with Ren among them. As the dragon boat sailed to the east gate of Dongchang hall, the dragon boat was suddenly stranded and unable to sail having to stop the boat for a moment they cast anchor. The accompanying officials immediately told Kangxi, requesting him to order a water worker to clean up the river.

The governor of Dongchang received information that the river had blocked the dragon boat; frightened and terrified, he didn't know what to do. "You don't need to be panic," Ren said. "You can send someone to clean up the water and find out why."

Workers cleaned out the obstacles and soon found a stone tablet, its writing somewhat blurry; Kangxi asked: "What's on it?"

Kangxi walked out of the dragon boat, and the handwriting on the stone became more clear, so he said, "There is no tax since today." Ren knelt on his knees. "Thank you, My Lord," he said. Kangxi puzzled and asked, "What does this mean?" Ren said: "Dongchang is suffering from the flood, people's livelihood is difficult." Kangxi finally listened to Ren, suddenly remembering that Ren had reported this situation three times, but because he was busy, there was no reply.

The stone tablet wasn't due to providence. Ren had asked his family to check the exact time of the dragon boat's arrival in Dongchang, so as to make the stone tablets ready for the first night to secretly put the stone tablet into the river. It was known that those who intentionally block the dragon boat are guilty of attempted murder. Ren however thought it would be worthwhile to save the people of Dongchang (Fig. 16).

After Kangxi's departure, the leader of Dongchang erected the "no tax since today" tablet, on the south bank of canal and built a monument to signify this moment. From then on, all cargo handling goods at this pier were not taxed.

In the exhibitions the gate of the Suzhou Guild Hall follows the tax exemption tablet. The Suzhou Guild Hall is located in the north side of Shan-Shaan Guild Hall, Liaocheng, and the west bank of the canal, which is a testament to the flourishing of the Liaocheng canal. When passing through the city, the canal transport prosperous, commercial prosperity, foreign and local rich commercial capital concentrated in Taiping street, and Shuang street river area, the foreign merchants guild also concentrated here, Shan Shaan hall, Jiangxi hall, martial arts hall, a total of more than 20, among the larger 8, known as the "eight guild halls". Shan Shaan guild hall is located in Longwan park where stopped the most ships in Liaocheng, Shanxi, Shaanxi businessmen have more than 1000 people, capital is the most abundant, so the spirit is also the largest Shan Shaan guild hall (Fig. 17).

The Grand Canal Museum, Fig. 16 Kangxi, Emperor of the Qing Dynasty history, the longest reigning emperor

The Grand Canal Museum, Fig. 17 Suzhou Guild Hall

Economy and Culture Development

The prosperity of commerce had greatly increased the population of Liaocheng. In addition to Liaocheng's local population were personnel brought in by the canal's official ship, greatly promoting the development of Liaocheng handicraft industry. These industries include printing, ship repair, gold silver processing, garment cutting, food processing, bamboo weaving, brick, and tile creation but the most influential being Linqing's Gong brick.

Emperors and literati had come to Liaocheng many times along the canal; among them, Emperor Kangxi of the Qing Dynasty had stayed three times and personally inscribed the "shen guang zhong ying" plaque in the Guangyue building. Emperor Qianlong visited nine times, writing 13 poems during his stays. A picture

The Grand Canal Museum, Fig. 18 Image of Emperor Qianlong of the Qing Dynasty's journey to the south. [Qianlong] title of the fourth emperor's reign in Qing Dynasty

commemorates Emperor Kangxi's stay and his exemption of taxation, now located on the wall of great relief.

The exhibition of the "Emperor Kangxi's southern tour ceremony" was transcribed onto a long scroll, with the original located in the Palace Museum. The long scroll depicts the grand scene of Kangxi's southern tour with a simple brushstroke, providing insight into the makings of this flourishing area.

The Liaocheng canal zone is also part of the "sluice river," and since the opening of the Huitong River, successive governments have set up different management agencies in Liaocheng. The Yuan Dynasty was located in the city of Zhangqiu, and the Ming Dynasty was set up on the bank of the city. In addition, the Dongchang canal services department, the canal standard camp, the canal garrison, the Dongchang department, the Pingshan health department, and the other canal military institutions such as the department of public health also provided a guarantee for the smooth operation of the canal (Fig. 18).

The year of Xuande in Ming Dynasty (1429) had a history of more than 570 years on the west bank of the Grand Canal, 300 m south of the city. There are more than 80 ancient buildings, which occupied an extremely important position in the history of grain transportation by the canal. The cultural relics exhibited in these display cabinets were all collected for the preparation of the China canal cultural museum. Among these relics are ship tickets, shipping orders, queries, and some musical instruments.

The smooth opening of the canal promoted the prosperity of the culture and promoted the development of engraving, printing, and writing, making Liaocheng one of the centers of national engraving and printing. Liaocheng's book industry, goods hall, boxing hall, and four great

booksellers were a canal coastal exclusive. The printed books were exported to Beijing, Tianjin, Suzhou, and Hangzhou during the Qin and Jin Dynasties. Most of the ancient books on display in this exhibition are from these printing houses. Combined, they were the largest and oldest book industry of Liaocheng. The Kangxi book production founded in Liaocheng in the east gate road included bookbinding and paper collating, and authors could be very fastidious. These books are very popular. The bookstores are also located in Taiyuan, Xin County, Shanxi Province, Pingyao, Jinan, and other places. In addition to marketing in Shandong Province, the printed books were exported to Beijing, Datong, Zhangjiakou, Luoyang, Xuzhou, Tianjin, Nanjing, and Shanghai. There were over 1000 books and books of engravings in the books.

The Grand Canal Museum, Fig. 19 Cangjie, the inventor of Chinese characters in legend

Liaocheng Historical and Cultural Relics Exhibition

The ancient, beautiful, vast, and magical land of Liaocheng once gave birth to a generation of hardworking, intelligent, loyal, and courageous people of the west Shandong Province. The people here used their hands to create the magnificent cradle of Chinese civilization we see today.

Fortunately, predecessors left us with valuable cultural relics, historical sites, poems, and the beautiful legends of the heart. Even more precious, generations of Liaocheng people forged the spirit of "self-improvement, pragmatic innovation, openness, honesty and trustworthiness."

Liaocheng City is located in the lower reaches of the Yellow River, Luxi Plains, and is located at the junction point of three provinces: Hebei, Shandong, and Henan. It is 114 km wide and 159 km long, totaling an area of 8715 km^2. This area now has jurisdiction over eight counties (Dongchang District, Linqing City, Guanxian County, Shenxian County, Yanggu County, Dong'e County, Chiping County, and Gaotang County) and an economic development zone, with a total population of 5.73 million (Fig. 19).

The Liaocheng historical and culture relics exhibition is divided into six parts: the Prehistory period; Shang, Zhou, Qin, and Han Dynasties; Wei, Jin, Sui, and Tang Dynasties; Song, Liao, Jin, and Yuan Dynasties; Ming and Qing Dynasties; and modern time.

The first part of this exhibition is prehistoric times. Ancient Liaocheng ancestors on the west bank of Jishui, equivalent to the area of Chiping, Dong'e, and Dongchang prefecture, were primarily involved in primitive agriculture, fishing, and hunting. By the Late Neolithic age, they had created a splendid prehistoric culture. Liaocheng's ancestors, like others in the Shandong Province, were known for making bows and arrows and consequently known as "Dongyi people," belonging to the tribe of Dongyi and later integrated into the Huaxia tribe. At present, there are 17 cultural relics of Dawenkou, more than 40 sites with Longshan cultural relics, and 15 Yueshi cultural sites in Liaocheng. The discovery of Chiping teaching field and two groups of Longshan culture sites in Jingyang mountain, Yanggu, informs us that the Liaocheng area had formed three levels of social organization structure. These findings provide an important reference for the study of the

The Grand Canal Museum, Fig. 20 Dawenkou Cultural Red Pottery with three pouch feet

origin of Chinese civilization. The legendary Chinese ancestors like Chiyou, Cangjie, Chaofu, Shun, and Yu had left their footprints in Liaocheng (Fig. 20).

The second part of the exhibition is on the Shang, Zhou, Qin, and Han Dynasties. During the Shang and western Zhou dynasties, there were many important countries in Liaocheng. During the Spring and Autumn period of the Warring States Period, social unrest and wars were frequent, and Liaocheng became an important strategic point for the warring states. During the Qin and Han dynasties, Liaocheng's economy developed rapidly, establishing many industries and numerous cultural relics, providing important rich materials for the study of the economic and social development of the two Han dynasties. By the end of the Eastern Han dynasty, Liaocheng had become an important political and military base for Cao to unify the north (Fig. 21).

On display here, there are more than 30 Shang Dynasty cultural relics and more than 40 west Zhou Dynasty cultural relics. Additionally, there is also a picture named "The war in Maling," depicting a notoriously famous war in ancient Chinese military history (Fig. 22).

The Wulou tomb of Han Dynasty in Yanggu is located in the Yanggu County. The Liaocheng cultural relics administration committee dug it in August 1997 and found many relics. The tomb was created with bricks, and the layout resembles a Chinese character "凸," with the brick building being comprised of an aisle, two rooms, and corridors. The burial chamber is surrounded by corridors, the corridors being connected. During the process of cleaning this site, discoveries on the front and back porch consisted of bronze mirrors, tripods, wells, and other pottery. The east corridor had iron swords, bronze chariots, and horses. The west corridor had figures and animals, such as dogs, geese, pigs, and sheep. According to textual research, the owner of this tomb was a prince in Yangping of the late west Han Dynasty. The display case for these items has a piece of the picture on the stone of the tomb of the Han Dynasty in Dengmiao village, Jianglou, Dong'e, and a collection of painted ceramic horses (Figs. 23 and 24).

The third part of the exhibition is Wei, Jin, Sui, and Tang Dynasties. These were a time of great integration for our nation, in which Liaocheng's regional economic and social status resulted in sustainable development. Confucianism, Buddhism, Taoism, and other cultural trends flourished, and numerous outstanding historical figures and talented people created a claim to fame. Here there are many pictures of ancient

The Grand Canal Museum, Fig. 21 Porcelain pillow, Song Dynasty, 960 AD–1279 AD

The Grand Canal Museum, Fig. 22 Knife made in Shang Dynasty

famous people, like Cao Zhi (son of Cao Cao), Huaqin (Minister of Han Dynasty), Ma Zhou (Head of the secretariat of Tang Dynasty), and lv Cai (a scholar in the Tang Dynasty).

On display here there are also a lot of precious unearthed cultural relics, such as a stone statue of the Tang Dynasty 52 cm high and 32.9 cm wide and the image of Maitreya-taught Buddhist scriptures, which is a Tang Dynasty stone carving art, but also historical religious data for the study of Buddhist art. The Tang Dynasty sea beast grape mirror is a larger size and has fine intricate sea grape patterning, with a few sea lions on its back, surrounded by symmetrical grape branches made from pure copper. The sea beast mirror style was primarily manufactured during the Wu Zetian period, Tang Dynasty. There is also a collection of Tang sancai ceramics from the Tang Dynasty, known for their wonderful works of ancient Chinese art and regarded by many famous museums in the world as priceless treasures.

The fourth part of the exhibition is the Song, Liao, Jin, and Yuan Dynasties. These Dynasties were a period of great national integration, with the economy, society, and culture continuing to develop diverse characteristics. The Huitong River excavated in Yuan Dynasty, Liaocheng, quickly became an important place of political, military, and economic matters due to its location (Fig. 25).

Longxing Temple Tower, located in Dongguan, Dongchangfu District, according to textual research, was built in the Northern Song Dynasty and is the oldest existing building in Liaocheng. The tower has an octagonal pavilion-style pagoda, standing 15.8 m tall with 12 floors. The tower was originally 13 floors; however due to storms and earthquakes, only 5 floors remain in the base. In 1973, the government organized personnel to perform maintenance on the tower.

The Grand Canal Museum, Fig. 23 White porcelain jar

The Grand Canal Museum, Fig. 24 White porcelain jar

While doing so, personnel found an underground palace, where they found many copper statues, net bottles, period currency, Buddhist artifacts, and a silver coffin in which there were ashes and many Sariras. In 1973, the damage the century tower had taken had been reversed and is now standing proud by the ancient canal again. Liaocheng Tower is one of China's few stone constructions, with its architectural style and stone carving art having a high research value, and as such the tower is now part of a national key cultural relics protection unit (Fig. 26).

The fifth part of the exhibition is the Ming and Qing Dynasties. During these dynasties, Liaocheng became the main trade center of the canal, with the political, military, and cultural center in Luxi. In the late Qing Dynasty, the ethnic and class contradictions became increasingly acute, causing the anti-imperialist patriotic peasant revolution movement to break out in Liaocheng (Figs. 27 and 28).

There is a group of Ming and Qing Dynasties of jade carvings. The ancients pay attention to "lines must have meanings, and that means auspicious", which has become a feature of ancient Chinese artifacts, especially the jade system, with its precious material, it is carefully designed, this piece of jade, cleverly avoided and to cover up the jade material in the qin color and gap pattern.

The sixth part is modern times. Liaocheng has a glorious revolutionary tradition. During the Agrarian Revolution, the Anti-Japanese War, and

The Grand Canal Museum, Fig. 25 Longxing Temple Tower (built in the Northern Song Dynasty)

The Grand Canal Museum, Fig. 26 Ewer of Longquan Kiln (Yuan Dynasty, 1271 AD–1368 AD)

the War of Liberation, the people of Liaocheng, in pursuit of democracy and expelling foreign aggression, produced many praise events through the lands, where there are many people capable of evoking praises and tears, creating a positive contribution for the liberation of the Chinese nation and the China revolution.

She is like a mirror, reflecting the Dongchang Lake, reflecting the harmony of civilization and light.

The Grand Canal Museum, Fig. 27 Copper

The Grand Canal Museum, Fig. 28 Black-glazed jar with four loop handles (Song Dynasty, 960 AD–1279 AD)

She is like a melody, lingering in the light of the floor, echoed with unwavering singing.

She is like a train, carrying five thousand years of dreams, Chi to the future more clear direction.

Today, standing at the intersection of our history and future, we admire and enjoy together our country's insightful and profound history. We witness together and explore her wonderful and eternal land.

Conclusion

In this essay I have used the case study of the Grand Canal Museum to highlight the importance of cultural heritage and the complexity of this heritage in China. Liaocheng, an ancient canal, absorbed the essence of ancient Chinese, modern Chinese, and foreign cultures, with amorous feelings from all of China's northern and southern folk, forming the unique canal feeling and culture, to be the scene of many historical stories and backgrounds. Numerous literati and famous

The Grand Canal Museum, Fig. 29 The Grand Canal Museum, Liaocheng, China

scholars had visited here and left many poems, which enriched the infinite charm of Liaocheng. Classics such as *The Travels of Marco Polo*, *Heroes of the Marshes*, *The Golden Lotus*, *Strange Stories from a Chinese Studio*, and *The Travels of Lao Ts'an* have all left the shadow of Liaocheng in their content (Fig. 29).

The birth of Liaocheng City is due to the canal, along with the people of the canal, and the canal's many generations. In recent years, vigorous implementation of the ancient canal renovation and protection of Liaocheng City has taken place, removing "sewage, silt and greening, active water distribution, landscape protection and management," strengthening China's Grand Canal of Liaocheng section's ecology, culture, tourism, leisure, commercial, and residential activities, adding new vigor to the city. There are some images showing the new landscape in Liaocheng district. During the renovation of the canal, a large number of precious canal relics were unearthed, including exquisite porcelain and inscriptions, being extremely valuable objects for studying the canal's history.

China's Grand Canal has given Liaocheng more than 400 years of prosperity and has left a rich cultural heritage for Liaocheng. Liaocheng's people will never forget the merits of the Grand Canal and will continue to inherit its excellent culture, cultivating and carrying forward the "self-reliance, inclusive, open, honest and trustworthy, pragmatic innovation" spirit of Liaocheng in the new period, surely accelerating the development of the city. Meanwhile, in line with the scientific plan and the requirement of building a ecological civilization city, we shall take the

opportunity of the declaration of world culture heritage by the grand canal and South-North Water Transfer Project to create the new splendid glory of Liaocheng, the ancient city.

It was once said that the Grand Canal and the Great Wall were written by our forefathers on the land of China. They are long, large, enduring, powerful, and influential and are unmatched by any other civilization in the world. The Grand Canal and the Great Wall are the cultural treasures of our Chinese nation. If the Great Wall guards the safety of agricultural civilization with its barrier function, then the canal has injected vitality into the civilization with its transportation functionality. Our people believe that with the increased protection of the Grand Canal, China's Grand Canal will surely become a World Heritage Site. The profound cultural connotation of the Chinese nation will always inspire us to become the source of our spiritual life.

Grapes: Origins and Development

Charlene Murphy
Institute of Archaeology, University College London, London, UK

Basic Species Information

It is difficult to discern the true wild ancestor of cultivated grape (*Vitis vinifera* L.) because the Mediterranean Basin has a wide variety of wild forms. These include escapees and seed-propagated weedy types growing in natural habitat, occurring mainly in disturbed surroundings and cultivated clones of the grapevine (Zohary and Hopf 2001: 152). Recent genetic studies have proven that cultivated grapevines growing in different regions have genetic diversity and heterozygosity which can only have been established through an influx of genes from nearby wild *V. sylvestris* populations (Imazio et al. 2006: 1009). *Vitis sylvestris* C. C. Gmelin is now considered to be the wild race of the cultivated grape and is indigenous to southern Europe, the Near East, and the southern Caspian belt (Zohary and Hopf 2001: 152).

Vitis vinifera (L.) (grape) is the sole Mediterranean representative of the genus *Vitis* (Zohary and Hopf 2001: 155). The plants are monosexual with the female flowers only ripening into grapes. *Vitis vinifera* is hermaphroditic and occasionally, with the escape of cultivated vines into the wild, reverts back to *Vitis sylvestris* (wild variety) in all characteristics except for being a hermaphrodite, and the seeds of these escapees remain much closer to those of the cultivated form. In terms of elevation, the plant can establish itself at a height of 400 m above sea level and is rarely found as high as 800 m. The cultivated *Vitis vinifera* has a more restricted distribution than its wild variety (Renfrew 1973: 125; Olmo 1995).

Timing and Tracking Domestication

Using genetic studies, Imazio et al. (2006: 1003) have claimed to have found a unique domestication center for all the European cultivars of *Vitis vinifera* located in the Caucasian and Middle East regions, which was present around 6000–7000 years ago and is supported by historical sources. Molecular genetics has shown the existence of varietal exchange and propagation throughout Europe (Imazio et al. 2006: 1010). However, the process of domestication of the grapevine is still largely unknown.

Within the palynological record, *Vitis* is noted in several locations in northern Greece with an increasing presence, albeit patchy, both spatially and temporally, since the beginning of the Holocene. Around 3500 BP (1550 BCE) onwards, there is a rise in the pollen record that is believed

Grapes: Origins and Development, Fig. 2 (**a**) and (**b**) Carbonized Vitis vinifera (grape) pips and (**c**) mineralized Vitis vinifera (grape) pip (all ventral views) from Insula VI.I, Pompeii, Italy. (Photo by author)

to reflect human manipulation and cultivation of the grapevine (Bottema 1982 cited in Valamoti et al. 2007: 56). Recent archaeobotanical analysis has confirmed this complex interaction and spread of the grapevine through Europe and the Mediterranean region by humans with carbonized seeds of both *Vitis sylvestris* (*Vitis vinifera* ssp. *sylvestris*) and *V. vinifera* recovered from prehistoric sites throughout Europe (Renfrew 1973: 125; Zohary and Hopf 2001: 156; Terral et al. 2010: 443). The earliest archaeological evidence of the domesticated grape comes from Egypt and Syria during the fourth millennium BCE. In Palestine seeds of grapes date from 3000 BCE to Bronze Age sites in Jericho (Jashemski 2002: 174). Based upon archaeobotanical and historical information, it is known that domesticated grapevines appeared during the first half of the third millennium BCE in Minor Asia, Southern Greece, Crete, and Cyprus. At the start of the second millennium BCE, they have been recovered from the Southern Balkans, and during the second half of the second millennium BCE, they first appeared in southern Italy. Subsequently, during the second part of the first millennium BCE, the distribution extended to

Grapes: Origins and Development, Fig. 3 SEM of carbonized Vitis vinifera (grape) pip from Insula VI.I, Pompeii, Italy. (SEM by author)

Northern Italy, Southern France, Spain, and Portugal (Riviera-Nunez and Walker 1989 in Imazio et al. 2006: 1004).

The fresh fruits of grapes are rich in sugar, containing 15–25% sugar content. Practically, grapes can be easily stored as dried raisins in winter storerooms, and the juice can be fermented and made into wine. Viticulture is

Grapes: Origins and Development, Fig. 4 (**a**) Carbonized half fragment of Vitis vinifera (grape) pip and (**b**) carbonized grape pip embedded in mesocarp from Insula VI.I, Pompeii, Italy (scale in centimeters). (Photos by author)

considered a risky agricultural enterprise compared with other non-staple crops that are suited to the Mediterranean climate. Fermented grapes were the commonest source of alcohol in the ancient world and probably the cheapest intoxicant available, as well as an extremely important trade item around the Mediterranean Basin (Brothwell and Brothwell 1998: 147; Zohary and Hopf 2001: 151).

The secure identification of cultivated versus wild grapes has proven problematic and has been a topic of heated debate among archaeobotanists for the last half century. Stummer (1911) initially pointed out that pips from *Vitis sylvestris* were small, short, and broad, whereas pips of cultivated grapes had longer stalks and were narrower in relation to their length (Renfrew 1973: 127–129; Runnels and Hansen 1986; Smith and Jones 1990: 317). Traditionally, the established distinction between archaeological specimens of wild (*Vitis vinifera* ssp. *sylvestris*) and domesticated (*Vitis vinifera* ssp. *vinifera*) grapes has been based on the overall dimensions and other morphological characteristics of the grape pips. Due to the fact that there is considerable overlap between the cultivated and wild types, "pip shape cannot be regarded as a safe diagnostic trait for distinguishing between wild and cultivated Vitis remains in archaeological excavations" (Zohary and Hops 2001: 153). A number of studies on both cultivated and wild charred grape remains have demonstrated that the moisture content in the plant and fruit and the oxygen level present during the time of charring could potentially influence the final dimensions and morphology of the charred grape seeds and ultimately affect their preservation and survival in the archaeobotanical record (Margaritis and Jones 2006: 791–792) (Figs. 1, 2, 3, 4, and 5).

Basic Biographical Information

Paolo Graziosi (1906–1988) was one of the most relevant Italian scholars in prehistoric archaeology. Born in Florence in 1906, his father was the sculptor and painter Giuseppe Graziosi (1979–1942), and his mother was Bianca Coduri, an artist. In 1930 he graduated from the University of Florence with a degree in natural science under the supervision of Aldobrandino Mochi, an anthropologist, and Renato Biasutti, a geographer. During this period, he had his first experiences as researcher, spending multiple research periods in Paris where he studied with Henri Breuil (Vigliardi 1992).

In 1933 he began his fieldwork experiences in Africa, first in Libya (1933), then in Egypt (1935), and in Somalia (1935), focusing on reconstructing the archaeological stratigraphy of important prehistoric sites (i.e., Bur Eibi in Somalia).

Graziosi taught prehistoric archaeology in the School of Humanities, at the University of Florence (1936–1977), which was the second Italian university to create this course after the University of Rome.

He became a lecturer in anthropology (1939–1953) and then paleoanthropology (1942–1953) in the School of Natural Science, at the University of Pisa. In 1954, he became full professor of anthropology at the University of Florence, position he held until 1977 (Vigliardi 1992).

Graziosi was the co-founder of the "Istituto di Paletnologia" (1940), the "Museo e Istituto

Fiorentino di Preistoria" (1946), and the Italian Institute of Prehistory and Protohistory (1954). He was also an active member of numerous societies and the organizer of multiple workshops, exhibition, conferences, and congresses (e.g., International Congress of Prehistory and Protohistory).

His interest in the rock art and prehistory is visible from the numerous campaigns conducted in Italy and abroad. In Italy his most famous excavations were conducted at the Balzi Rossi caves, Romanelli caves, and Porto Badisco cave in Italy. Since 1950 he studied the Levanzo island (Italy) where he discovered both Neolithic pictures and Paleolithic rock art (Vigliardi 1998).

Graziosi also conducted multiple fieldworks and study periods abroad such as in Libya (1933, 1938, 1939, 1940, 1952–1954, 1962, 1965, 1967–1968), Egypt (1935), Somalia (1935, 1952–1954, 1958, 1963), Spain (1950), France (1959), Chile (1959), Peru (1959), Argentina (1959), India (1954–1960), Pakistan (1954–1960), Afghanistan (1954–1960), Eritrea (1961), Ethiopia (1965), Scandinavia (1957), Mexico (1957), and Kenya (1958), focusing on prehistoric rock art, lithic industries, and paleoanthropology. Additionally, he served as scientific member to the Italian expedition to the Karakorum K2, directed by Ardito Desio where he was in charge of the archaeological research in Pakistan and India. There, Graziosi surveyed numerous Paleolithic and Neolithic sites, analyzing extensively the lithic material of the north-western Punjab (Graziosi 1964).

Major Accomplishments

Graziosi published more than 260 articles that highlight his extraordinary academic breadth on the subjects of prehistory, ethnography, rock art, and anthropology. His first published work was on the Venus of Savignano (Graziosi 1926), which he completed before enrolling to university, probably guiding his future interests to prehistoric arts. Graziosi's research interests included Euro-Asian and African prehistoric cultures, and his investigations made him a pioneer in the study of African rock art and lithic industries.

In Italy Graziosi directed numerous excavations at the Romito cave, S. Teodoro (Messina), Levanzo (Egadi), and Porto Badisco cave. His research of Romanelli cave first highlighted the need for rock art to be investigated in conjunction with precise stratigraphic information (Graziosi 1932; Graziosi 1933). He was a precursor in the reconstruction of prehistoric sites by the combined used of stratigraphy, material culture, and stylistic analysis of prehistoric paintings, expanding this analysis to compare motives across different geographical areas (Graziosi 1973). His last published research was on the Porto Badisco cave (Italy) where he focused on the Neolithic paintings, the stratigraphy, and the methodological process applied to the study of cave paintings (Graziosi 1987).

His fieldwork in Libya (1933–1940 and 1952–1968) helped him to develop a rigorous methodology promoting analysis of the lithic industries as well as a new classification for local rock art (Fig. 1). His studies were published in numerous articles and in the monograph *L'arte rupestre della Libia*, which mainly focused on the classification and stylistic analysis of Libyan rock art (Graziosi 1942). Likewise, his studies in Somalia were collected in the ample monograph *L'arte della Pietra in Somalia* that it is still considered one of the most comprehensive works on Somalia prehistoric archaeology. The volume presents a comprehensive catalogue of archaeological sites, lithic finds, and rock art finds in the region (Graziosi 1940).

Graziosi's major contribution to lithic studies was constituted by his research of Mousterian lithic industries, which focusing on both qualitative and quantitative data helped reconsider the role of the microburin as a fossil guide in the passage between Paleolithic and Mesolithic in Italy (Graziosi 1951). Graziosi's extensive investigations also have the merit to address the problem of chronology in rock art sites as he dedicated multiple publications to highlight that stylistic and contextual analysis should be combined with stratigraphic information and the analysis of material culture. His investigation of technological, contextual, and stylistic characteristics of cave paintings and engravings was

Graziosi, Paolo,

a cutting edge and helped him coin the term "Mediterranean artistic province" for Italian, French, and Spanish rock art sites (Graziosi 1960).

He was the founder of the scientific journal *Rivista di Scienze Preistoriche* (1946) and a member of the Accademia dei Lincei, and he received numerous national and international honors and awards. The Museum of Prehistory in Florence was named in his honor and posthumously hosts Graziosi's archive donated to the Museum in his will. In 1992 the Italian Institute of Prehistory and Protohistory organized and published a memorial in his honor (Vigliardi 1992).

Great Zimbabwe, 1100–1600 AD, Rise, Development, and Demise of

Innocent Pikirayi
Faculty of Humanities, Department of Anthropology and Archaeology, University of Pretoria, Pretoria, South Africa

State of Knowledge and Current Debates

Introduction

Since the monumental architecture of Great Zimbabwe and sites related to it became known to Westerners in the sixteenth century, the scope and grandeur of the site has never ceased to amaze observers. From the days of the earliest Portuguese travelers' narratives, speculation about the site has been continuous and inventive. Since serious scholarly interest started in the late nineteenth century, debate on the origins, development, and decline of the culture once based there and later elsewhere has never stopped. With increased archaeological research throughout the twentieth century, and at the beginning of the twenty-first century, it has become even more complex. From the viewpoint of heritage, Great Zimbabwe is testimony to a major civilization that existed in Southern Africa between the eleventh and seventeenth centuries. The settlement, whose remains cover some 700 hectares, was an important trading center, connected to the worlds of the northern Indian Ocean and the Far East.

Great Zimbabwe (Fig. 1) fits into a conventional category of settlements that only exists on the Zimbabwe plateau and adjacent regions of eastern Botswana, the middle Limpopo Valley, and the Mozambican plains and nowhere else in

Great Zimbabwe, 1100–1600 AD, Rise, Development, and Demise of, Fig. 1 View of the Great Enclosure and the valley complexes at Great Zimbabwe. (Photo by the author)

the world. The critical question then is how should we characterize these monumental, stone-built structures which are unique to this part of southern Africa? They were certainly major settlements, far exceeding the sizes of farming villages, which dominated the region in the preceding century, showing considerable internal functional differentiation, greater regional cooperation, and integration. Their appearance further brought southern African societies into the global commercial network of eastern Africa and Asia.

The Portuguese referred to Great Zimbabwe and hundreds other stone-built structures over the Zimbabwe escarpment as "great stone edifices," which they thought served as palaces for the biblical King Solomon, the Queen of Sheba, and the legendary Prester John. The inhabitants of Mukaranga, whom the Portuguese encountered from the early sixteenth century onwards, called these "Simbaoe" (*Zimbabwe*, houses of stone), meaning centers of authority and power (Diogo de Couto, *Decade IX,* Chapter 25, In Theal 1898–1903, p. 390). Antiquarian investigators reinforced these Portuguese views from the late nineteenth century onwards, labeling the Hill Complex at Great Zimbabwe a copy of the biblical Solomon's temple, while the Great Enclosure was seen as a replica of the palace the Queen of Sheba stayed in when she visited Jerusalem. The auriferous southern African region, which attracted European explorers and concession seekers, reinforced the idea of Ophir, as the source of King Solomon's gold. Theodore Bent (1896) referred to Great Zimbabwe and other monumental structures in the region as "cities." During much of the twentieth century, professional archaeologists have realized the monumentality associated with Great Zimbabwe and other places, but accompanied by minimal discussion on what these represented (see, e.g., Huffman 1977). These sites are currently interpreted as pre-European urban centers (see Sinclair 2012; Sinclair et al. 1993; Manyanga et al. 2010), which exemplify a transformation of the region from agrarian modes of production to complex sociopolitical forms.

Evidently these structures were local in origin (Caton-Thompson 1931; Garlake 1973) and, in terms of size, were more than just large villages. Roland Fletcher has suggested that they, like their counterparts in Asia, Europe, and the Americas, might be usefully considered as a class of settlement with "no name." As undefined phenomena, they transform the global understanding of settlement growth, gain new significance in regional culture histories, and have implications for our urban future.

Focusing on Great Zimbabwe, this entry presents the nature and form of early anomalous settlements in southern Africa, pointing out that these centers defined futuristic settlements. Their size and density had a bearing on sustainability, which is also connected to their continued existence or eventual demise. Sustainability is important when considering the fate of Great Zimbabwe, as the natural resources around it indicate a fragile ecosystem. These have a bearing on the settlement "process" at Great Zimbabwe and determined the type of settlements found especially on the periphery, which may have required less aggregation, less density, and far less monuments. This discussion places Great Zimbabwe in the context of new global approaches to giant, anomalous places in its category, in other parts of the world. The objective is to further dialogue on Great Zimbabwe, to understand what it was.

Physiography

Great Zimbabwe is situated in the southern sections of the Zimbabwe escarpment (GPS ref.: 20 deg. 16′ 22.64"S, 30 deg. 56′2″E, 1150–1250 m above sea level) (Fig. 2). The physical landscape comprises whaleback granodiorite hills. The hills define a watershed with several micro-catchments, drained by streams and small rivers towards the Mutirikwe and Tugwi rivers. These rivers flow southeastwards draining into the Runde River, which in turn joins the Indian Ocean-bound Save River. The vegetation is mixed savannah woodland. The bare granite hilltops have *Brachystegia* and varieties of acacia vegetation on their slopes and adjoining valleys. Some 10 km west of Great Zimbabwe are greenstone schists trending southwest/northeast, where evidence of pre-European gold workings has

Great Zimbabwe, 1100–1600 AD, Rise, Development, and Demise of, Fig. 2 Map of the Zimbabwe plateau and adjacent regions showing the location of Great Zimbabwe. (Photo by the author)

been recorded (Phimister 1974, 1976). The weathering of granodiorite rock has been exploited since the early second millennium AD, as stone could easily be shaped into building materials and used in the construction of residences (*dzimba dzemabwe* or *Zimbabwe*) (houses of stone) (Pikirayi 1993, 2001a).

Compared to other regions of the escarpment, Great Zimbabwe is located in a favorable environment, with sufficient, though variable, summer rainfall (800–1300 mm) and periodic winter rains (*guti*) to allow the cultivation of cereals such as maize, sorghum, and millet. Surveys suggest the granite geology was exploited very intensely to capture underground water sources for use at the site. This practice is still carried out today around Great Zimbabwe today, with farmers using the water to irrigate maize and vegetables. Apart from the variable annual rainfall, and the extremely high summer temperatures are a constraining factor to subsistence activity. Droughts and arid conditions occur frequently (see Scoones et al. 1996). Significant periods of aridity during the last 1000 years (Huffman 2008, 2010a; Tyson and Lindesay 1992) may have triggered large-scale abandonment of such regions. Chiefdoms and states may have arisen as collective responses to these constraints, through the control of strategic resources such as water, cattle, and grain (Kim and Kusimba 2008, Huffman 2009a, b, 2010b).

Origins

Prior to the rise of Great Zimbabwe in the early to mid-thirteenth century (see Chirikure et al. 2013), the region was inhabited by farmers, as attested at Chivowa, Gumanye, and Great Zimbabwe hills (Sinclair 1985, 1987). Their material culture shared similar cultural traits with those found in the middle Limpopo Valley and adjacent areas. In effect, southern Zimbabwe was on the margins of mainstream developments in the middle

Limpopo Valley for much of the tenth, eleventh, and twelfth centuries AD, where emerging chiefdom and possibly state level societies competed for the gold and other trade with the Indian Ocean coast (Huffman 2007). However, it is the manner in which farmers in southern Zimbabwe responded to the Indian Ocean trade that shifted the momentum in their favor. Those around Great Zimbabwe seized upon this opportunity during the twelfth centuries and increasingly wrestled for political and economic dominance of the southern Zimbabwe escarpment from the thirteenth century onwards. At Chivowa and Great Zimbabwe, the first substantial houses appeared, the design of locally made ceramics changed, and access was gained to a greater number of imports (Sinclair 1984, 1985). During the thirteenth century, this process rapidly advanced. Dry masonry stone walls were raised using blocks of granite that screened the compounds of prominent people. By c.1250, the foundations of an elaborate urban center had been set. While the importance of agriculture and cattle (Garlake 1978) must not be overlooked in the rise of Great Zimbabwe, long-distance trade played a huge part, acting as a powerful catalyst transforming localized tribal organizations into regional ones. Both land and cattle were essential in developing a vital social network of associates, clients and kinship ties, and to enfranchise management of goods and services distributed as benefits within traditional political and social institutions.

The southern Zimbabwe escarpment seems to have offered a more favorable environment and climate for the support of a large urban complex and territorial state (Pikirayi 2001a). By 1250 AD, Great Zimbabwe was clearly the more preferred destination for Indian Ocean traders; with the consequence that Mapungubwe and other polities in the middle Limpopo Valley were undercut, losing their wealth in the process (Pikirayi 2003). The fate of floodplain agriculture in the middle Limpopo Valley is not clear during this time, but a large-scale abandonment of the region towards more favorable environments may have triggered further the region's demise. Other scholars link the rise of Great Zimbabwe to the ideology of rainmaking or control (Huffman 2009b). However, this is not practical (Pikirayi 2001a) and clearly not supported by Karanga/Kalanga histories and ethnographies. These histories and ethnographies point to rainmaking centers or cults located away from centers of political power, with responsibilities for rain ceremonies entrusted to members autochthonous to particular regions, and not linked to the ruling elite or even rival dynasties.

Great Zimbabwe's location points to the possibility of a viable agriculture even under drier climatic conditions (Holmgren and Öberg 2006). Added to this must be local water management strategies used to capture and use water from the surrounding granite landscape. The rise of Great Zimbabwe, ultimately, was a combination of economic opportunities driven by gold resources as well as the need to manage a variety of environmental assets and hazards, in a region where droughts and prolonged periods of aridity, high rainfall, and flooding were common.

Settlement Layout

Great Zimbabwe is located within and around a granite hilly terrain (Fig. 3). The layout of its structures indicates a core, characterized by massive and imposing monumental architecture, and a peripheral zone, with far less visible settlements. The first stone structures were built on a whaleback hill during the twelfth and thirteenth centuries (Chirikure et al. 2013). They are collectively referred to as the Hill Complex. Here two very large enclosures (the Western Enclosure and the Eastern Enclosure) and several smaller intervening ones, all constructed from, and in between natural granite boulders, define living spaces, presumably for royalty. Ritual spearheads, iron gongs, and soapstone bird effigies attest to the existence of royalty (Huffman 1996). Commoner settlements are found at the base of the hill, enclosed within a perimeter wall, but soon the population became too large to be retained inside it. With the expansion of the settlement, royalty shifted to the more elaborately built elliptical complex, named the Great Enclosure. Constructed during the thirteenth and fourteenth centuries, it is the largest single stone-built structure in southern Africa. It has a girdle wall

Great Zimbabwe, 1100–1600 AD, Rise, Development, and Demise of, Fig. 3 Granite country around Great Zimbabwe. (Photo by the author)

244 m long, 6 m wide, and 11 m high. The Great Enclosure, which is accessed via three entrances to the north and northwest, encloses a passage leading to a conical tower and a number of enclosures. The destructive activities of antiquarian investigators during the late nineteenth and early twentieth century make it difficult to determine how this massive structure was utilized (Garlake 1973), but it appears the enclosures partitioned domestic and public spaces, some perhaps serving ritual functions (Huffman 1985). Overall, the Great Enclosure represents the peak development of Great Zimbabwe both as a major settlement and as a state (Chirikure and Pikirayi 2008; Pikirayi and Chirikure 2011).

Five enclosure complexes were constructed adjacent to the Great Enclosure and extending to a nearby valley to the northeast and east. Commonly referred to as the Valley Complex, they date from the fifteenth century onwards and probably represent the royal palaces used in the terminal periods of the settlement.

A second perimeter wall, which is well defined to the west of the settlement, attests to the continuous growth of Great Zimbabwe. Beyond these are "peripheral settlements," being stone enclosures located on a number of hills around Great Zimbabwe (Huffman 1996). Their function has not been established archaeologically. It has been suggested they housed members of the ruling family (Huffman 1996) or catered for the increased administrative functions of the metropolis (Pikirayi 2001b). The area between the core and the peripheral structures revealed dense mud-built structures, interpreted as commoner housing (Huffman 2007). Overall, all this reflects an expansion of the settlement.

Early Portuguese descriptions seem to focus on the largest and most impressive part of Great Zimbabwe, called the Great Enclosure. This may have been the focus of the settlement just prior to their arrival in northern Zimbabwe. The identity of Great Zimbabwe is strengthened by references

to the conical tower and the location of stone walled settlements in surrounding hills:

> "This edifice is almost surrounded by hills, upon which are others resembling it in the fashioning of the stone and the absence of mortar, and one of them is a tower more than twelve fathoms high." (De Barros, in *Decades*, 1.10.1, In Theal 1898–1903).

Modern mapping to determine the extent of Great Zimbabwe started with Karl Mauch (Burke 1969) in the early 1870s. Karl Mauch attempted to clear the overgrown Great Enclosure to enhance access to the site. His rudimentary sketch plans and three-dimensional representation of both the Hill Complex and the Great Enclosure is a first attempt in presenting the site to a European audience (Petermann 1874). R. M. Swan, who worked together with Theodore Bent produced the first accurate plans of the site, which Swan interpreted using absurd astronomical theories (Bent 1896), and for which he was criticized by Sir John Willoughby (1893) and Frederick Mennell (1902). Sir John Willoughby himself destroyed the stratigraphy of two stone structures and contributed towards the disappearance of one large enclosure, a record of which only exists on Mauch's sketch plan. Franklin White (1903–1904, 1905), a mining engineer, published an accurate, scientific plan of the Great Enclosure (which referred to as "Temple or Elliptical Building") in the *Journal of the Royal Anthropological Institute*. This plan was used by subsequent researchers until 1958, although compromised somewhat by the pillaging which took place, particularly as reflected in the work of Bent (1893a, b, 1896), Hall (1905, 1909; Hall and Neal 1902), and the Public Works Department (PWD), who administered the site from 1891 to 1936.

Size and Function

David Randall-MacIver (1906) observed that the stone structures of Great Zimbabwe were "very imposing," with "a massive grandeur all their own" (p. 61) when compared to others, but not as extensive as those of Nyanga, as lavishly decorated as those found in the Insiza district, in reference to Naletale, Danangombe, and other structures in west-central Zimbabwe. In terms of the extent of the site, he identified "…three distinct, though connected, groups of buildings, viz. the 'Elliptical Temple' (Great Enclosure), the 'Valley Ruins' (Valley Complex) and the 'Acropolis' (Hill Complex)". The 'Valley Ruins' are described as extending for about three-quarters of a mile in a line from east to west and occupying the southern side of the valley that separates the 'Elliptical Temple' from the 'Acropolis' (p. 75).

The first aerial photographs of the site were taken by Caton-Thompson in 1929, and these further enhanced the accuracy in the mapping of the core settlement. Using published plans, Fletcher (1993) provided a broad comparative view of settlement sizes of indigenous African towns and cities and discussed them in relation to information management and the role of external economic influences. This was useful pioneering work, which crucially pointed to the need for detailed archaeological surveys to provide more accurate detail. Noting the challenges represented by the edges of settlements, some of which are clearly not recognizable, or consistent, Fletcher (1993) provided a useful indicator of the sizes of African towns. Great Zimbabwe is presented as a dispersed, low-density residential town (see Fletcher 1993, pp. 738, 740). This interpretation is informed by Huffman (1977) and Sinclair et al. (1993) who conducted systematic archaeological surveys and detailed excavations around Great Zimbabwe, altering previous estimates about its size.

Great Zimbabwe was of comparable size to pre-industrial London (early thirteenth–mid-sixteenth century) (see Fletcher 1993, Fig. 44 (a)), the only difference being settlement density, with London more compact. A size of between 6 and 8 km^2 in extent would be a realistic estimation, based on current archaeological evidence. In relation to later African cities such as Zaria and Addis Ababa which spread over a far larger area, the overall tendency was for such settlements to have relatively low average residential densities and comparatively small population sizes. This would make it easier to manage. A very large settlement would imply marked communication difficulties (Fletcher 1981).

According to Fletcher (1986), an assessment of the overall behavioral factors affecting settlement size has to refer to the total built area and occupation area within which the aggregate activity of the community occurred and should be identified archaeologically from the general scatter of debris that marks a site. An open settlement is presumed to include a periphery of open spaces, service function localities, and dumps. The peripheral zone of a settlement may be recognized as a low-density scatter of occupation debris.

Using a combination of archaeological, ethnographic, and historical evidence with ecological and statistical modeling, Chirikure et al. (2017) have revised the population estimates of Great Zimbabwe from the 20,000 (Garlake 1973) towards a Fig. 10,000 people. This is supported by the absence of large middens at the site, the chronological differences between several key areas of the settlement traditionally assumed to be coeval, and the historically documented low populations recorded for the subcontinent between the early seventeenth and the twentieth centuries.

From the limited scientific archaeological excavations, we are unable to estimate Great Zimbabwe's urban density. A differentiation is imperative given the marked spatial differences between houses enclosed within the stone enclosures and those outside these. The latter suggested dense settlement associated with commoner housing (Huffman 2007). Use of such space remains debatable (see, e.g., Pikirayi and Chirikure 2011), largely based on the merits and demerits of using the ethnography. Alternative approaches are needed, which provide appropriate tools to describe and measure spatial layout, especially integration and connectivity (see, e.g., Long et al. 2007). It is spatial configuration that affects people's spatial cognition, and human cognitive maps are developed through movement and interaction rather than through a set of predetermined rules. Great Zimbabwe grew into a large settlement, and this was achieved not only through accessibility and connectivity to certain spaces but also through facilitating and limiting access and connection to the same spaces. This also involved reorganization of certain spaces and revisiting some of the spatial principles followed in using space previously (Pikirayi 2013c).

Few studies have discussed the use and meaning of space at Great Zimbabwe and other Zimbabwe Culture sites (see, e.g., Huffman 1984, 1985, 1996, 2007; Beach et al. 1997, 1998). These studies however did not address basic questions about the minds of the inhabitants who lived inside the stone structures and the towns they defined. The connections between royalty and commoners, for example, have not been viewed in the context of how settlement design reconnected urban neighborhoods, how space was used for food production and industrial output, and how the overall layout expressed organizational structure of the residents. It makes sense to view the various parts of these urban centers as operating and functioning both independently and as extensions to each other.

An alternative approach to the use of space at Great Zimbabwe may be arrived at through the study of the built environment, especially the development of stone architecture (Pikirayi 2013c). At Great Zimbabwe authority and power defines space, and thus there is a connection between space and authority. The importance of residential spaces extends to non-built areas, e.g., middens. Understanding the development of monumental and non-monumental architecture towards a composite, integrated settlement is necessary.

Development

To understand how Great Zimbabwe grew to become a giant settlement as well as center of a territorial state, an evaluation of the evolution of the settlement based on available radiocarbon and other dating evidence, and monumental architecture, is imperative. The activities of antiquarian investigators as well as the Ancient Rhodesian Mining Company would result in the pillaging of Great Zimbabwe and similar structures in Southern Africa between the 1890s and 1920s. This compromised the work of professional archaeologists, who struggled to establish a credible stratigraphy and chronology for the site. The activities arising from the antiquarian and scientific archaeological investigation of Great

Zimbabwe would result in the Zimbabwe controversy, which dominated the historiography of the site for the entire twentieth century (Pikirayi 2001a; Chirikure et al. 2013). The dating and chronology of Great Zimbabwe was key to the controversy. Most forgotten in understanding how Great Zimbabwe grew into a large settlement is its monumental architecture. I discuss the dating and chronology first.

The scientific archaeological excavations from the various parts of Great Zimbabwe conducted since the early twentieth century provide a limited stratigraphic information as well as dateable imported glass beads and Asian ceramics. The advent of radiocarbon dating in the 1950s would result in the generation of absolute ages on archaeological events at Great Zimbabwe. Available radiocarbon dates have been extensively discussed by Huffman and Vogel (1991), Chirikure and Pikirayi (2008), Pikirayi and Chirikure (2011), and Chirikure et al. (2013). Huffman and Vogel (1991) argue for a limited settlement at Great Zimbabwe, from the late thirteenth to mid-fifteenth century, while a recalibration of the same radiocarbon dates, as well as the use of Bayesian modeling by Chirikure and Pikirayi (2008) and Chirikure et al. (2013), points towards a much longer settlement of the site. Great Zimbabwe may have been settled from the eleventh century, with the first stone walls being constructed end of the twelfth century/beginning of the thirteenth. The site was continuously occupied up to the late sixteenth/early seventeenth centuries. The Bayesian modeling indicates that the Hill Complex flourished between approximately 1100 and 1280, while the Great Enclosure flourished between 1225 and 1380. The settlement expanded from there to other parts, including the Valley complexes, which were settled up to the early seventeenth century. This chronology matches that of the imports, especially glass beads, which date the site from the early tenth to the sixteenth, possibly seventeenth century.

In spatial terms, the dating suggests that the earliest palace complex existed on the Hill, and later on moved to the Great Enclosure and the valley prior to abandonment (Chipunza 1993, Collett et al. 1992, Chirikure and Pikirayi (2008), Pikirayi and Chirikure (2011)).

The thirteenth century witnessed increased gold production and trade on the Zimbabwe plateau, matched by corresponding prosperity in east African coastal cities. Great Zimbabwe itself has yielded a range of imported ceramics, including Persian tin-glazed earthenware bowls, Chinese celadon, and Chinese stoneware vessels as well as Near Eastern glass, some coral pieces, a variety of copper objects, bronze hawk bells, yellow and green glass beads, brass wire, and cowrie shells (Garlake 1973; Chirikure et al. 2013). Great Zimbabwe had extensive regional and long-distance trading networks with central Africa, the Indian Ocean coast, the Persian Gulf, India, and the Far East (Garlake 1973).

Many studies of Great Zimbabwe and related stone-walled sites have treated architecture as a backdrop to typology and dating of the structures (e.g., Garlake 1970; Whitty 1957, 1961). They have used wall types P, Q, and R as a basis for relative dating and chronology, as well as for tracing the development of building sequences. This observation has remained the cornerstone for understanding the development of the culture once based at Great Zimbabwe and its spread to the northern and western regions of the Zimbabwe plateau (see Walker 1993). The emergence and development of monumental architecture brings Great Zimbabwe into the realm of regional and intercontinental trade, becoming the Great Enclosure the largest, most influential and wealthy city in southern Africa, especially during the second half of the fourteenth century.

Demise

The decline of Great Zimbabwe as a center of a powerful prehistoric state remains unresolved. A major factor is the unsystematic investigations of late nineteenth/early twentieth century European antiquarians and prospectors that destroyed its stratigraphy and looted it in search of Near Eastern artifacts and gold. While systematic research from the 1950s onwards has resolved the chronology of the site and identity of the builders, circumstances leading to the decline or even collapse of the site remain obscure.

Explanations range from the effects of long-distance trade (Huffman 1972; Pikirayi 2006), environmental degradation (Garlake 1978), climate change (Holmgren and Öberg 2006), to the emergence of competing polities to the north and west (Pikirayi 1993, 2013b).

It remains unclear what role climate change played in the demise of Great Zimbabwe. Although the cool-dry conditions experienced in the fifteenth century (see Holmgren et al. 2003; Tyson and Lindesay 1992; Tyson et al. 2000, 2002) could have undermined its agriculture and its increasing population (Holmgren and Öberg 2006), the location of Great Zimbabwe in a favorable rainfall zone would have offset this (Huffman 2007). Given the generally warmer and wetter conditions, the abandonment of Great Zimbabwe may not have been conditioned by climate. However, Hannaford et al. (2014) attempt a synthesis and critique of the extant hypotheses and dominant approaches regarding possible regional climate-society linkages in Southern Africa for the period covering the origins and demise of Mapungubwe and Great Zimbabwe. They pay particular attention to climate causation and determinism, relating the southern African context to global issues on the same. This approach is in response to recent discussion in global climate history literature on environmental collapse which has raised critical questions over the basis of climate as a chief causal factor is societal change. Given that Mapungubwe and Great Zimbabwe witnessed considerable sociopolitical complexity which may have ended due to environmental change, social disintegration, population depletion, and migration, they discuss the potential of societal vulnerability and resilience and attempt to incorporate diverse sources of data to help understand the role of climate in southern African history.

Beyond climate change, it is important to realize that Great Zimbabwe had to prosper as a territorial state and had to extend its influence to maintain regional dominance. Its inhabitants needed more land for farming, while traders wanted more gold for export to the Indian Ocean coast. The demise of Great Zimbabwe after 1400 AD may be linked to general global economic depression experienced at the time (Pikirayi 2006). Europe saw a falling demand in gold. Great Zimbabwe, located close to the gold mining areas and production centers, must have felt the effects of this economic downturn. International trade began to decline from the early fifteenth century, as indicated by the paucity of Chinese porcelain at Great Zimbabwe. In response to this, the elite at Great Zimbabwe expanded regional networks of trade, leading to the rise of monumental structures in distant regions like the Makgadikgadi Pans in eastern Botswana and northern Zimbabwe (Pikirayi 2006). By the late fifteenth century, the consequences of this decision were obvious in terms of demographic and regional shifts of some of the population from southern to northern Zimbabwe which saw the rise of the Mutapa State (Pikirayi 1993). To the west, Great Zimbabwe was facing competition from Khami, the capital of the Torwa State, which developed an architectural canon different from the former, but which translated into far more superior and grandeur monumental entity. By the sixteenth century, political and economic power had shifted to the northern and western regions of the Zimbabwe escarpment. From this explanation, Great Zimbabwe may have expanded too fast and rapidly. Written sources indicate Great Zimbabwe continued to be inhabited in the sixteenth century (Pikirayi 2006, 2013a, b), while a Bayesian modeling of available radiocarbon dates suggests settlement until the early seventeenth century (Chirikure et al. 2013).

Great Zimbabwe in the Present

In considering collapse or demise, it is important to detect and document societal stresses which develop over the long and short term. Questions to be asked, for example, are whether Great Zimbabwe experienced overpopulation growth, a declining subsistence base, a deteriorating physical environment around it, and competition from neighboring polities which undermined its regional influence and economy. These developments have a bearing on settlement growth or shrinkage. Thus the role of environmental degradation in the demise of Great Zimbabwe

requires reconsideration from the perspective of sustainability.

Current surveys around Great Zimbabwe documenting its water resources indicate that the inhabitants relied mainly on subsurface water, which was tapped or harvested from springs that occurred with the granite landscape (Pikirayi et al. 2016). The water was carefully channeled to the core of the settlement where it was stored in reservoirs for consumption (Fig. 4). It is evident these springs provided the bulk of the settlement's water requirements as some of the streams and rivers flowing to the east and south of Great Zimbabwe are fed from these sources and have running water for throughout the year. This points to sustainability and resilience, which can help interrogate the demise of the settlement and collapse, and even regeneration of the settlement (see Tainter 2006).

The current population living around Great Zimbabwe, which is between 5000 and 10,000 inhabitants, relies entirely on water from the springs all situated within a 5 kilometer radius of the site. It is dispersed all over the granite landscape, the only clustering existing at two places, one a tertiary institution to the south and the other a "growth point" – a term synonymous with emerging urban or rural centers in Zimbabwe. This dispersal is critical since settlement growth and expansion do impair the natural functions performed by watersheds. The growth of Great Zimbabwe must have factored this into account, since not all parts of the granite landscape are suitable for settlement. Some parts of the landscape such as streams and valleys to be managed differently in response to increases in human-induced environmental pressure. This decoupling was necessary to ensure conservation of vital resources in the landscape and allowed for managed population growth. It remains to be demonstrated how other human activity may have offset this.

Recent research has focused on local narratives around water resources within the

Great Zimbabwe, 1100–1600 AD, Rise, Development, and Demise of, Fig. 4 Some of the reservoirs used by the inhabitants of Great Zimbabwe to store water. (Photo by the author)

Great Zimbabwe and broader landscape (Pikirayi 2019). It came out of the realization that archaeologists struggle understanding the demise of Great Zimbabwe because of poor appreciation of local and regional histories of the southern Zimbabwe plateau, post-fifteenth century. Listening to some of these extant histories and living narratives is key to understanding developments around Great Zimbabwe from the sixteenth century onwards. Focus on Boroma, a toponym east of Great Zimbabwe, the study invokes sixteenth-century Portuguese accounts which mention "Burrom" (Boroma), who is presented as a prince in charge of a "fortress" whose location coincides with Great Zimbabwe. Local narratives and histories as well as documented written sources collected from villagers living around Chizhou Hill some 100 km north of Great Zimbabwe connect the settlements there to the resettlement of the area by migrants from the Mutapa State in northern Zimbabwe. The Mutapa State (1450–1900 AD) is regarded as the successor of Great Zimbabwe (Pikirayi 1993). These landscape dynamics attest to a complex process on the demise of Great Zimbabwe and its culture from the sixteenth to the nineteenth centuries

Sustainability is about living within the means of our natural systems and ensuring that human lifestyles do not harm society and culture. At Great Zimbabwe, it must be viewed in human terms, encompassing the potential for long-term maintenance of well-being, with a bearing on the environment, the economy, politics, and culture. The question is whether there was anything around the site which could have caused negative impact on the resident population. Sustainability is located at the confluence of society, the physical environment and economy. For sustainability to occur, society and economy must be equitable; the relationship between society and environment must be bearable, while economy and environment must be viable (Adams 2006). It must be measured to determine risk, societal resilience, and vulnerability.

There is a link between settlements of this magnitude with a presumably large residential population and aspects of sustainability, with the general assertion that higher-density settlements are more sustainable than low-density cities. However, this remains a contested area of planning theory, and there is need to consider the correlation between energy consumption and overall urban density of a given settlement, i.e., the lower the density, the more energy consumed (Newman and Kenworthy 1999). Thus, can one use sustainable urbanism – the application of sustainability and resilient principles – to the design planning, and functioning of ancient places such as Great Zimbabwe? We need to consider a number of options: (a) the total floor area of buildings divided by land area they are built on; (b) residential density, which is the number of dwelling units in any given area; or (c) population density (the number of people in any given area).

Despite many years of archaeological fieldwork (as is the case with Great Zimbabwe), settlements with a dispersed occupation are hard to recognize. Fletcher pointed out that assessing how the community dealt with scarce resources such as salt and water becomes very difficult when a 4–5 km ^{2}, low-density occupation is being considered rather than a compact 50–70 hectare settlement. According to Fletcher (1993) resource supply cannot in general be proposed as a factor directly affecting settlement area, as it is regionally specific. It is the absolute number of very large settlements in a region which is a function of resource supply. Resource constraint apparently delimits the number of large community aggregates which a region can support and therefore the probability of a very large case arising. Thus regardless of what resources communities command, the growth of their settlements is constrained by the limits to manage the flow of information and services within the settlement. This is universal.

How could the management of Great Zimbabwe's environment have impacted on its growth as a settlement? The micro-catchments within the Great Zimbabwe landscape, and in many cases the variable slope, also had a bearing on the low-density settlement experienced even to this day. A rise in population within this may have generated impervious cover due to vegetation

clearance, which in turn, impacted on water quality. Great Zimbabwe's hilly location and surroundings point a constricted catchment and highly impaired micro-watersheds due to intense construction activity, especially towards and within the core of the settlement (on vegetation clearance and increased imperviousness, see Butler and Davies 2000).

Current studies on water suggest that dispersed, low-density developments can exacerbate nonpoint source pollutant loadings by consuming absorbent open space and increasing impervious surface area relative to compact development (Richards et al. 2003). Thus there is a relationship between water quality and growth patterns. In the face of drought and aridity, communities are increasingly concerned about managing their watersheds to maintain hydrologic integrity and water quality. It is the most valuable asset of any settlement. Water pollution can be ascribed either point source (e.g. industrial discharge) or non-point source (which can result, say in increased sedimentation). Great Zimbabwe's water quality was largely point source, as some of this was generated from urban runoff. Water quality may have been compromised by increased nutrients, metals, hydrocarbons, bacteria, and other constituents.

How did the authorities at Great Zimbabwe manage the impacts of development on water availability and quality? Was a low-density footprint bad for Great Zimbabwe's water availability? What was the impact of commoner housing on water quality? There are no indications that low-density development is better for watershed quality because it limits impervious cover at the site level. High-density development is better for watershed water quality because overall it disturbs less land to accommodate the similar number of people and leaves more land available to serve critical ecological functions (Richards et al. 2003, pp. 345–346).

Another important point to consider for Great Zimbabwe is water withdrawal by its increasing population. How much did this alter the water quality, and the amount contained in the aquifers, and how sustainable was this, modelled on a population of more than 2000 people? By the peak of Great Zimbabwe, what could have been the city's water demand, and how was this demand managed?

Greater Syria: Islamic Archaeology

Marcus Milwright
Department of History in Art, University of Victoria, Victoria, BC, Canada

Introduction

Greater Syria (also Bilad al-Sham, meaning literally the "country of Syria") is one of the most extensively excavated regions of the Middle East. The wealth of excavations is complemented by numerous field surveys as well as published studies of the material culture, architecture, and environmental data gathered during these projects. Most phases of Islamic history are well represented from the seventh to the early twentieth century, as are the centuries preceding the Islamic conquest (the period known as Late Antiquity). Archaeological projects have targeted every type of settlement from cities and towns to villages and transient forms of occupation. There have also been excavations of built structures as diverse as industrial installations, water catchment systems, religious monuments, domestic architecture, palaces, and fortifications. While the geographical coverage of this archaeological work is somewhat uneven, the volume of published studies allows for the formation of sophisticated research questions concerning the political, socioeconomic, and cultural life of Greater Syria in the Islamic period.

Definition

The term Greater Syria refers to a large area encompassing the modern states of Syria, Lebanon, Jordan, Israel, and the Palestine Authority. In addition, the historical boundaries of Greater Syria take in the southeastern part of Anatolia (Turkey). Damascus, also sometimes known in Arabic as al-Sham, was the principal city from the seventh century onward and usually functioned as the administrative capital of Greater Syria. Other major urban centers of Greater Syria during the Islamic period are Aleppo, Jerusalem, Homs, Hama, and Beirut. Places such as Ramla, 'Akko (Acre), Karak, and Raqqa rose to political and economic prominence for more limited phases before the modern period.

The backbone of the premodern economy was the agricultural sector, and many parts of Greater Syria were densely occupied with villages (as they still are today). The heavily populated areas are mainly located in the fertile lands of the western side of Greater Syria and along the Euphrates river. Estimates of the population of rural areas also need to take into account the pastoralist groups (bedouin) who have coexisted with sedentary farmers for millennia. Bedouin and their flocks move in an annual cycle between semiarid steppe lands and areas of permanent agricultural cultivation. Prior to the widespread employment of modern irrigation techniques and chemical fertilizers, agriculture was largely determined by the climatic and geological factors. Most other parts of the region possess semiarid or arid climates, with an annual precipitation of about 300 mm being the minimum required to sustain dry farming techniques (principally for growing wheat and barley). The Dead Sea and Jordan valley and parts of the Syrian littoral experience a subtropical climate that allows for the cultivation of a wide variety of fruits as well as valuable crops such as sugar cane, dates, rice, and indigo. There is debate concerning the occurrence of periodic fluctuations in annual temperature and rainfall in the Late Antique and Islamic periods (Rubin 1989). Allowing for the possibility of cooler and wetter phases, it remains the case that adequate rainfall in the winter period (typically October to March) dictated whether crops would succeed. Periods of severe drought are recorded in written sources, though the archaeological evidence suggests that rural communities were usually able to recover from these and other types of short-term catastrophe (Johns 1995). Cisterns and other simple forms of water catchment are commonly employed in rural areas, often for sustaining flocks or sheep. Sophisticated systems of dams and canalization are relatively rare in Greater Syria, and some of those utilized during the Islamic period were actually constructed in earlier centuries.

The economy of Islamic Greater Syria was also reliant upon manufacturing and trade. The region was famed in Medieval Europe as a source for the finest crafts. The most lucrative crafts – particularly high-quality textiles, glass, decorated glazed ceramics, inlaid woodwork, and inlaid metalwork – tended to be located within or on the peripheries of urban centers. Less expensive objects were produced in towns and villages all over Greater Syria. Pastoralists also made items for sale including woolen rugs, leather, and food items such as dried yoghurt. The region contains some of the necessary resources for these activities, including plant and animal products, deposits of high-quality clay and sand, and limited reserves of copper and iron ore. Other raw materials had to be imported from neighboring areas. For instance, Greater Syria contains few forests, and wood needed for building, manufacturing, and as fuel for industrial activities might sometimes be brought from more densely wooded areas such as the Taurus mountains in southern Anatolia. Throughout the Islamic period Greater Syria benefited from a vibrant mercantile sector. The location of the region must in part account for this: Greater Syria connects to both the Mediterranean and Red Seas (the latter principally through the port of Ayla in southern Jordan), and land routes lead north to Anatolia, east to Iraq, south to the Arabian Peninsula, and southwest via the Sinai to Egypt.

Historical Background

Greater Syria was one of the first regions to be incorporated into the nascent Islamic state in the years following the death of the Prophet Muhammad in 632. Muhammad sent troops north in 629, but they were defeated near Mu'ta by a force led by a Ghassanid phylarch of the Byzantine empire. The decisive engagements in the conquest of Greater Syria were at Ajnadayn in 634 and at Yarmouk in 636; as a result of these victories, the Arabs were able to occupy the administrative capital of Damascus (634) and the symbolically significant city of Jerusalem (probably 637). In 638 the region of Jazira (i.e., between the Euphrates and Tigris rivers) was conquered. The Arab armies continued to fight against the Byzantines in northern Syria during the caliphate of 'Uthman (r. 644–656). In the early Islamic period, Greater Syria was subdivided into administrative regions (*jund*, pl. *ajnad*) comprising Dimashq (Damascus), Hims, Urdunn (Jordan), Filastin (Palestine), and Qinnasrin.

Mu'awiya ibn Abi Sufyan, the founder of the Umayyad dynasty (661–750), served as governor of Syria under 'Uthman and used the resources of the region in his struggle with caliph 'Ali (r. 656–661). When Mu'awiya assumed the caliphate (661–680), it was a natural move for him to transfer the capital of the empire to Damascus. Papyri excavated at Nessana in the Negev provides evidence for the operation of a bilingual (Greek and Arabic) bureaucracy during the reign of Mu'awiya (Hoyland 2006). With the exception of Marwan II (r. 744–750) who favored Harran in southern Anatolia, the Umayyad caliphs all employed Damascus as their seat of government. Due to the patronage of al-Walid I (r. 705–715), the city was equipped with a magnificent Congregational Mosque occupying the ancient *temenos*. The caliphal palace was located immediately south of the mosque. Damascus is also important as the mint for gold (*dinar*s) and silver (*dirham*s) coins, other provincial mints in Greater Syria only being permitted to strike copper (*fals*, pl. *fulus*) (Walmsley 2007: 59–64). Jerusalem too was the subject of extensive Umayyad patronage, particularly under 'Abd al-Malik (r. 685–705) and al-Walid I. The remodelling of the Temple Mount (Haram al-Sharif) included the rebuilding of the Aqsa Mosque and the construction of the Dome of the Rock, the Dome of the Chain, and a complex of palatial/administrative structures to the south and southwest of the enclosure walls (Creswell 1989: 18–42, 73–82, 94–6; Prag 2008: 101–241).

The Umayyads were toppled in 749–750 and the caliphate passed to a new dynasty, the Abbasids (749–1258). The eastward focus of the Abbasids led them, under the caliphate of al-Mansur (r. 754–775), to establish a new capital, Baghdad, on the banks of the Tigris in Iraq (constructed between 762 and 766). This crucial

shift in the center of power into the heartlands of the former Sassanian Empire (c. 224–651) was to have far-reaching consequences for the development of Islamic culture; for Greater Syria the effect was rather negative with the removal of the caliph and his court diminishing the political importance of Damascus and reducing economic activity throughout the region. The south of Greater Syria was also hit by a massive earthquake in 749, and evidence for the destruction of urban architecture is abundant in the archaeological record. It is important not to overemphasize the extent of the decline after c. 750, however; Abbasid caliphs continued to build new structures – most notably the cistern at Ramla (dated 789) – and renovate others, such as the Aqsa Mosque and Dome of the Rock. The Umayyad buildings south of the Temple Mount evidently remained in use through the early Abbasid period (Prag 2008: 157–8, 195–207). Even more important is the foundation of a new city, al-Rafiqa ("the companion"), about 600 m to the west of the town of Raqqa (known as Kallinikos prior to the Islamic conquest). This urban development also comprised a series of palaces and related structures to the north, and between 796 and 808 it served as the capital of the caliph Harun al-Rashid (r. 786–809) (Daiber and Becker 2004).

The authority of the Abbasid caliphs eroded in the latter part of the ninth century. This process led to the establishment of semiautonomous or fully independent dynasties in various parts of the Islamic world. The political map of Greater Syria in the tenth and eleventh centuries is complex with a combination of major empires – most importantly the Fatimids (909–1171) and the "Great Saljuqs" (1034–1057) – and local dynasties controlling the region. The First Crusade (1096–1099) created an entirely new dynamic with the establishment of a series of Frankish states in Greater Syria and southern Anatolia. These comprised the Kingdom of Jerusalem, the County of Tripoli, the Principality of Antioch, and the County of Edessa. The Franks brought with them a militant Christianity and a fierce determination to capture and hold territory in the "Holy Land." Analysis of surveys and excavations in Israel has also brought forward intriguing information about the Frankish (European) occupation of the countryside of the Kingdom of Jerusalem (Ellenblum 1998: 213–87).

The capture of Edessa in 1144 by Zangi, the *atabak* of Mosul (r. 1127–1146), marks a turning point in the political life of Islamic Greater Syria. This is the beginning of the Muslim "counter-Crusade" or Holy War (*jihad*) which was prosecuted with varying degrees of commitment by his son, Nur al-Din (r. 1146–1174), and the sultans of the Ayyubid (1171–1250 in Egypt and 1174–1260 in Syria) and Mamluk dynasties (1250–1517). Features of this period are a greater centralization of power, increased military expenditure, and a closer relationship between Egypt and Syria (with Cairo usually as the most important center of power). Nur al-Din unified most of Syria, while Salah al-Din (Saladin, r. 1171–1193) brought together Egypt and Greater Syria into one empire. This unity was broken during the Ayyubid confederacy that followed his death, but the Mamluk sultans, particularly Baybars (r. 1260–1277) and al-Nasir Muhammad (r. 1294–1295, 1299–1309, 1310–1341), sought to create an empire that would dominate the Levant. Salah al-Din scored a decisive victory over the forces of the Crusader states at Hattin in 1187 and went on to liberate Jerusalem from the Franks. The Mamluks ended the Crusader occupation of mainland Syria with the capture of ʻAkko in 1291. Even more important was the Mamluk defeat over the Mongol army at ʻAyn Jalut in Palestine in 1260. This battle halted the westward expansion of the Mongols through the Islamic world and established the Mamluks as defenders of Sunni Islam. While Mongol military activity doubtlessly brought short-term suffering for the inhabitants of Greater Syria, it is only among the urban communities along the Euphrates that the damage was more lasting; for instance, the pottery and glass industries of Raqqa and Balis cease around this time, and the towns themselves are abandoned.

In contrast to the instability of the later Ayyubid period, the Mamluk period from Baybars to the death of al-Nasir Muhammad in 1341 was one of considerable prosperity for Greater Syria. There was extensive investment in military architecture and in the transport and communications

infrastructure of the region. The relative security offered by the Mamluk sultanate facilitated trade, industrial activity, and investment in agriculture, especially valuable crops such as sugar cane (see below). Surveys conducted in Jordan and Israel provide plausible evidence that settlement numbers reached a peak in the thirteenth and fourteenth centuries. While locally produced handmade pottery predominates (Johns 1998), this phase is also characterized by the presence of glass and high-quality ceramics in many villages. A similar picture can be drawn from excavations in urban sites and ports in Greater Syria; in addition to Syrian luxury items, one sometimes also encounters exotic imports from Italy, Spain, or China.

The arrival of the Black Death in Syria in 1348 certainly had a huge impact upon the urban and rural communities of the region. Depopulation combined with a failure to invest in new technology affected the economic health of Greater Syria. Damascus also suffered during the occupation by Timur Lenk (Tamerlane, r. 1370–1405), probably losing many of its skilled artisans at this time. Evidence of destruction by Timur is also apparent in the excavations of the citadel in Hama, though the ceramic record indicates that the site was partially reoccupied in the late Mamluk and early Ottoman periods (Milwright 2000: 192). Judging from anecdotal evidence in contemporary written sources, the Mamluk authorities of fifteenth- and early sixteenth-century Greater Syria struggled to maintain security.

The Ottomans controlled Greater Syria between 1516 and 1918. Greater Syria was not one of the most profitable areas of the Ottoman Empire, and there is evidence for gradual decline in many aspects of the economy, particularly between the later seventeenth and the early nineteenth century. Ottoman authority in southern Greater Syria was also challenged in the first half of the nineteenth century by the expansionist policies of Muhammad ʻAli (d. 1849), ruler of Egypt. One area of significant Ottoman state investment from the sixteenth to the eighteenth century was in the route of the annual *hajj* through Greater Syria and northwestern Arabia. The major investment by the state was in the erection of a line of forts – each garrisoned with troops – and the construction of related features such as cisterns and bridges (Petersen in MacDonald et al. 2001: 685–91).

The Ottoman authorities demonstrated their continued commitment to the patronage of the *hajj* with the construction of the Hijaz railway from Istanbul to Medina (1900–1908). The military value of the Hijaz railway was recognized by all sides during World War I, and the southern section of this vital route was the subject of repeated attacks during the Arab Revolt (1916–1918). Following the expulsion of the Ottoman army in 1918, Greater Syria was placed under mandate by the League of Nations, with Britain controlling the southern part (Palestine and Transjordan) and France the northern part (Syria and Lebanon). The modern nation states of Syria, Jordan, Israel, and Lebanon emerged after the end of World War II.

Key Issues/Current Debates

A particularly fertile area of study is the period of transition from Byzantine rule to Islam. Broadly, the issues revolve around the degree to which the material record of the first phase of Islamic rule (from the conquests of the 630s to the mid-eighth century) manifests continuity with earlier centuries. If there were radical changes during this period, what were they and how did they affect the future development of Islamic culture in Greater Syria and elsewhere in the Middle East? These questions call for a comparative evaluation of Late Antique and early Islamic Greater Syria that takes into account the material culture of both urban and rural areas. Starting with the towns and cities, there has been considerable debate concerning the timing and nature of the evolution from the "Classical" city (Greek: *polis*) to the archetypal "Islamic" city (Arabic: *madina*). Consistent features of this evolution are the encroachment upon public spaces such as the forum and the wide colonnaded street as well as the disappearance of key institutions such as theaters, temples, and nymphaea (Kennedy 1985). In addition, most Late Antique/early Islamic towns occupy a smaller area than their Classical predecessors

(indicating a reduction in the population), and previously extramural activities, most importantly industries such as ceramic manufacture, start to be located within urban areas. In some cases pottery workshops were set up within abandoned theaters in the Late Antique and early Islamic periods.

It is now well understood that these processes predate the arrival of Islam and that in the early seventh century only remnants of Classical urban planning remained within most towns and cities of Greater Syria. The Christianization of the region from the fourth century eradicated the pagan temples and theaters (this was mirrored by a massive expansion in church building with single towns such as Jarash/Gerasa in Jordan boasting over 20 places of worship). Private building can also be detected in the colonnaded streets and other public areas, particularly from the sixth century onward. It has been persuasively argued that these adaptations reflect both a reduction in the power of local officials to control the public spaces and the expansion of mercantile activity within urban areas. The replacement of wheeled transport with pack animals (particularly camels) also made the wide, straight urban streets rather irrelevant.

Recent archaeological research has provided a nuanced picture of these changes in the urban fabric of Greater Syria during the transition from Byzantine to early Islamic rule (Magness 2003: 193–214; Walmsley 2007: 71–112; Avni 2011). Change was far from uniform across the region; for instance, there is evidence for the maintenance of colonnaded streets and other aspects of Classical urban planning in some towns in Palestine and Jordan through the sixth and early seventh centuries. Furthermore, the arrival of Islam did not result in a wholesale abandonment of these principles. The early eighth-century settlement of ʻAnjar is striking for its orthogonally arranged streets and orderly arrangement of space, and it seems likely that Ramla and other new Muslim cities (*misr* pl. *amsar*) of this time adopted similar principles. Within existing towns one encounters numerous examples of interventions by caliphs and other members of the Umayyad elite, ranging from new markets to mosques and administrative structures. Good examples of Umayyad architectural patronage have been identified at Beth Shean/Baysan (Scythopolis), Arsuf, Palmyra, and Jarash. The mosque at Jarash is notable for the way in which it is integrated into the street plan, despite its orientation being different from that of the main street (Walmsley 2007: 84–7). Archaeology is increasingly demonstrating that trade and industry continued to thrive in Greater Syria after the fall of the Umayyad caliphate; even in towns affected by the 749 earthquake, one encounters evidence for relatively ambitious phases of rebuilding.

While scholars in the early twentieth century had posited a reduction in the rural population in Greater Syria during the sixth and seventh centuries and virtual abandonment of some regions (most famously the "Dead Cities" of northern Syria), this picture is now subject to considerable revision. Reevaluation of occupation phases evidences continuous settlement into the eighth or ninth centuries. In the case of the Negev, this picture of rural prosperity under early Islamic rule is confirmed both by settlement patterns and the archive of papyri recovered from the town of Nessana (Magness 2003: 130–94). Umayyad patrons also invested in the countryside through the creation of country estates (*qasr*, pl. *qusur*), particularly in the more marginal lands of Jordan and Syria. While the *qusur* (sometimes known rather misleadingly as "desert castles") clearly had a role as sites of private entertainment for the Umayyad elite, more recent investigations have focused upon their placement along the major arteries of trade and communication and the promotion of agriculture in the surrounding areas. Links to the architectural patronage of the Ghassanid dynasty in the fifth and sixth centuries are suggested in the locations chosen for many of the Umayyad *qusur*. Dams, canalization, and extensive retaining walls have been found around several of the *qusur*; existing hydraulic structures were obviously brought into use, but some of what remains can probably be attributed to Umayyad patrons (Genequand 2006).

The most significant phase of activity in the Euphrates region dates from the last quarter of the eighth into the ninth century. The largest urban project was the walled city of Rafiqa (from 771). The construction techniques (principally mud

brick and baked brick), the use of carved stucco decoration, and the plans of the fortifications, palatial complexes, and mosques all suggest comparisons with the Iraqi cities of Baghdad (from 762) and Samarra (from 836) (Daiber and Becker 2004: 59–134). The presence of underground canals (*qanat*) in the vicinity of Raqqa-Rafiqa is a further indication of the eastward orientation of this Abbasid enterprise in Syria. Surveys of the irrigation systems of the Middle Euphrates and the Balikh and Khabur Rivers have demonstrated an upsurge in canal construction in this phase; presumably the expansion of irrigated agriculture was a response to the demands created by the huge urban populations of Raqqa-Rafiqa and Baghdad (Berthier 2001).

Considerable attention has been paid to the industrial sectors of the region, particularly the establishment of pottery- and glass-making facilities to the north and northeast of the existing settlement of Raqqa (Heidemann 2006). Analysis of the broken glass and glass waste indicates that artisans adapted their techniques (particularly the replacement of Egyptian natron with ashes made from locally abundant plants as the major fluxing agent), probably in response to difficulties in obtaining imported materials (Henderson 1999). Pottery production in the late eighth and early ninth century was more conservative, with potters concentrating upon the manufacture of utilitarian unglazed vessels and other items such as drainage pipes and roof tiles. Glazed ceramics were produced in very limited numbers in the early Abbasid phase, with luxury pottery (such as blue and white and luster-painted wares) being imported from Basra and other production centers in Iraq (Miglus 1999; Mason 2004: 92–4).

Raqqa was just one of the production centers for luster-painted and underglaze-painted stonepaste (fritware) wares in Greater Syria between the late eleventh and the fifteenth century. Excavations have identified evidence of production at sites including Damascus, Aleppo, Balis, Qal‘at Ja‘bar, and Raqqa, while others such as the “Tell Minis” (located near Ma‘arrat al-Nu‘man) group have less secure provenance. The understanding of the evolution of these centers of production has been further refined through petrographic analysis of thin sections of ceramic bodies and other forms of scientific analysis of glazes. It is now possible to establish a reasonably secure chronology with “Tell Minis” forming the transition between the techniques and styles of Fatimid period Cairo and the products of Syrian centers such as Raqqa (Mason 2004: 91–120).

Jordan and Israel have been the subject of extensive survey work, and these data allow researchers to plot the spatial variations and temporal fluctuations in rural settlement patterns. In many areas the ceramic record indicates an upsurge in sedentary occupation in the twelfth to fourteenth centuries (i.e., associated with the Crusader, Ayyubid, and early Mamluk periods). According to this evidence, settlement levels reduce during the latter part of the fourteenth century, and a process of decline continues unabated in areas such as Jordan until the end of the nineteenth century. One aspect of this process is perhaps a move from sedentary to pastoralist modes of occupation. While the relative prosperity of the twelfth- to fourteenth-century phase remains secure, the extent and nature of the later “decline” has been questioned. Much of the ceramic evidence in regions such as Jordan comprises handmade pottery, which has proven very difficult to date with accuracy. Furthermore, Ottoman cadastral records (*daftar*s) of the sixteenth century suggest continued productivity and sedentary occupation in rural areas (Johns 1995; Walker 2004).

The production of sugar and molasses was one of the most economically significant activities in Greater Syria between the twelfth and the fifteenth century, and numerous processing sites have been identified in the Jordan valley, around the banks of the Dead Sea, and in the region of ‘Akko. The processing of sugar was expensive requiring the construction and maintenance of the installations themselves, the manufacture of copper boiling vats and ceramic vessels (molasses jars and conical sugar pots), and the provision of labor, fuel, and water. Most of the sugar mills of Greater Syria probably ceased to operate during the fifteenth century largely because they were unable to compete with cheaper sugar imported from Cyprus. Wadi Faynan, located south of the Dead Sea on

the eastern side of the Wadi ‘Araba, has provided evidence for the revival of copper smelting in the thirteenth century (Kind et al. 2005).

The Ottoman period in Greater Syria has often been characterized as one of economic and cultural decline. This picture can now be revised in many respects; while it is true that the traditional crafts found it difficult to compete against industrially manufactured products from Europe (particularly after the late eighteenth century), the archaeological record suggests considerable economic activity with the inhabitants of Greater Syria consuming a wide range of locally made and imported goods. Notably successful in the confrontation with foreign imports were the ceramic producers of Gaza and Rashaya al-Fukhkhar. Examples of the gray-bodied (reduction-fired) “Gaza wares” are encountered on numerous sites in the south of Greater Syria. Pottery can also be used to track the emergence and spread of popular pastimes of the Ottoman period, tobacco smoking and drinking of coffee (and, from the nineteenth century onward, tea). The former is evident principally in the ceramic pipe bowls of the traditional *chibouk* pipe; the ubiquity of these artifacts is allowing for the formation of increasingly accurate typologies. A vital component of coffee drinking was the small glazed ceramic cup. Syrian manufacturers satisfied some of the demand for these decorative items, but it is also clear that they were also imported from Turkey, Europe, and Southeast Asia (Milwright 2000; Walker 2009). The issues of diet and disease in the Ottoman period have been investigated in paleopathological studies (e.g., Smith and Horwitz 2009).

International Perspectives

The study of the material culture of Greater Syria requires a constant awareness of the integration of the region into international networks of mercantile exchange and cultural interaction. Excavations of major ports such as Ayla on the Red Sea and Beirut and ‘Akko on the Mediterranean provide excellent evidence of changing patterns of long-distance trade. Chinese ceramics first make their appearance on sites of the early Abbasid period, such as Raqqa-Rafiqa, and by the thirteenth century enjoy a relatively widespread distribution across Greater Syria. The Ayyubid and Mamluk periods are particularly notable for the diversity of the imported ceramics, particularly on urban sites. These imports include slip-incised (sgraffito) wares from Italy, Cyprus, and the Aegean region, tin-glazed maiolica from Italy, luster wares from Spain, blue and white porcelain and celadon (“green ware”) from Southeast Asia, and glazed stonepaste from Iran. During the Ottoman period one also encounters imported glazed pottery from Turkey (particularly from Iznik, Kütahya, and Çanakkale) and a range of decorated porcelains from China, Japan, Korea, Germany, France, and Britain.

There is evidence of international contact in many other aspects of the material culture of Greater Syria between the seventh and the twentieth century. In architecture there are numerous examples of building plans, decorative styles, or modes of construction entering from other regions. For instance, minarets in locations such as Raqqa, Balis, and Qal‘at Ja‘bar draw upon Persian prototypes. Greater Syria formed part of larger polities during the Ayyubid, Mamluk, and Ottoman periods, and this facilitated further cross-pollination of architectural forms and decorative features. The presence of these forms of artistic exchange in architecture also opens the possibility of identifying similar phenomena in many aspects of the archaeological record from portable arts to urban planning and agricultural practices.

Future Directions

It seems likely that the archaeological study of Greater Syria in the Islamic period will continue to build upon many of the themes outlined in the previous sections. The ability of archaeology to appreciate long-term processes also means that continued excavation will refine our knowledge of such questions as the evolution of urban spaces through the Islamic period and the fluctuations in rural settlement and modes of cultivation in different regions of Greater Syria. The Ottoman period is particularly rich in primary textual sources, and this can facilitate future collaborative projects between historians and archaeologists.

The potential of integrating textual sources – chronicles, geographical and topographical writing, charitable bequests (*waqfiyyas*), travellers' accounts, mercantile or consular archives, cadastral records, and so on – with archaeological data has been demonstrated in numerous case studies. Archaeological projects now tend to emphasize collaboration between a wide range of specialists, and the recent contributions by archaeobotanists, zooarchaeologists, physical anthropologists, and environmental archaeologists illustrate the ways in which we can ask new questions of the physical remains of past cultures in Greater Syria. Lastly, there is much scope for comparative perspectives in future study. Periods of transition in Greater Syria could fruitfully be compared with equivalent phases in other regions of the Mediterranean (cf. Hodges and Whitehouse 1983) and elsewhere. The impact of the Crusades upon the Middle East invites comparison with Crusades in other regions as well as with later phases of colonial occupation. The Ottoman period offers rich potential for comparative research, with recent research in areas such as Greece and the Balkans providing an opportunity to evaluate the divergent experiences of being a province within a larger Muslim empire.

Greece: Cultural Heritage Management

Elena Korka
General Directorate of Antiquities and Cultural Heritage'Greek Ministry of Culture and Sports, Athens, Greece

Introduction

Greece is a country with very rich cultural heritage. From the prehistoric ages down to the present, Greek civilization has created monuments and artworks, which are outstanding landmarks and exceptional points of reference in human history. Greek art and architecture have inspired and highly influenced the Western world throughout the ages. The protection and preservation of this heritage has always been a priority for the Greek state since its independence in 1830. The legal framework for cultural issues offers guidelines for the protection and management of antiquities and cultural heritage in general.

Definition

The most recent legal framework is established in 2002 with Law 3028 (http://www.culture.gr/DocLib/g_1950.pdf), which protects monuments or cultural goods dating from prehistoric times until 1830. Certain categories, however, from more recent periods are also included, if they are important or have a specific cultural or historical significance. The management of Greek tangible and intangible heritage is administered and controlled by the state.

Efforts to protect remains of the past actually began before 1830 (Pantos 2000: 15–16), during the War of Independence, by the revolutionary Greek government. The first legal measures for the protection of antiquities in the modern Greek state were taken as early as 1833, and a year later, the first official law was published. The sensitivity and importance given to antiquities is apparent.

Since then, the legal framework has broadened its scope, and it is considered as one of the strictest and most extensive in the world. The Greek Constitution established in 1975 gives more power to the state, while it weakens private property for the benefit of the protection of antiquities and their environment. According to the Law, all movable finds and monuments are owned by the state, and all activities relating to them are controlled by the state Archaeological Service.

Inside the state boundaries protection covers antiquities on land or sea including marine zones, in which Greece has the right of jurisdiction according to international law. Greece seeks the protection of its antiquities outside its borders as well, in correspondence to the regulations of

international cultural law, irrespective of the time when they were removed.

Examples

For the better control of customs and the import of antiquities, Greece has signed bilateral agreements, protocols, and memoranda with countries such as Cyprus, France, Switzerland, China, Turkey, Peru, and the USA.

Greece gives also great importance to the repatriation of its cultural property and has internationally been very active in this field (Μπουτοπούλου et al. 2008). Repatriation of many cultural goods has been achieved in the last years. In several cases, a compromise solution was found, and in others, goods were returned on voluntary basis.

Greece and Italy have launched major campaigns for the restitution of cultural property and have even organized common exhibitions of returned antiquities under the title "Nostoi" with impressive objects repatriated from the J. Paul Getty Museum, the Shelby White collection, and others.

Since 1982, the Greek Ministry of Culture has officially requested the return of the Parthenon Marbles from the British Museum in London (Korka 2003, 2006). The request has been discussed at various international fora and organizations (Meyer 1977; Shaw 1979; Prunty 1984; Greenfield 1989; Walden 1996: 49–66; Renfrew 2000). This issue has world significance, because the Parthenon is considered the symbol of Western civilization and forms the logo of UNESCO. Greece undertook the construction of the New Acropolis Museum, which was inaugurated in 2009 next to the Acropolis in order to house all the Parthenon Marbles. Three museums (Heidelberg University Collections, Palermo Salinas Museum, and the Vatican) have supported this campaign by returning either permanently or on loan fragments of the Parthenon, which existed in their collections.

By 2005 there were twelve (12) national associations from around the world that supported the reunification of the Parthenon sculptures, whereas this number has increased to eighteen (18). Today, there are also 22 International Committees all over the world which support the reunification of the Parthenon Marbles in Athens.

In 2013 a process of mediation, facilitated by UNESCO, was undertaken for the Reunification of the Parthenon Sculptures. However the British Government and the British Museum have issued a formal response declining to participate in this process. The issue is pending on the agenda and is discussed by UNESCO at every meeting of the Intergovernmental Committee for promoting the return of cultural property to its countries of origin or its restitution in case of illicit appropriation (Hitchens 2008).

Key Issues

Propriety of antiquities belongs only to the state. The individual can only hold possession of them. The objects are inventoried and photographed, their provenance is checked, and a permit of legal possession is issued. This way a very important data base is accumulated with important antiquities, which benefit scholarship considerably. On the other hand, the individual is sensitized concerning the protection of cultural heritage. There is also strict control of the use of metal detectors.

The Archaeological Service of the Hellenic Ministry of Culture and Sports includes two General Directorates concerning the cultural heritage, one for antiquities and cultural heritage in general, including conservation, state museums, and folklore, and a second for restoration of monuments of all periods, photogrammetry, conservation of museums, and technical works and infrastructure in general. There are individual directorates and departments, as well, which coordinate regional services. These are the Ephorates of Antiquities on the one hand side and the Services of Modern Monuments and Technical Works on the other. The Archaeological Service also includes special regional services: for caves, underwater antiquities, and individual museums.

In addition, there are councils either regional or central, which examine issues of importance,

before which the citizens can present their requests and support their cases. Furthermore, there are special committees for the monitoring of the restoration of specific monuments or task forces, which are appointed for a specific project.

The Archaeological Receipts Fund for Sites and Expropriations, which is supervised by the Ministry of Culture and Sports, is in charge of publishing archaeological guide books, special editions, and annual periodicals, as well as for producing exact replicas of antiquities. The revenues from this fund support the work of the regional archaeological services.

The central services form the executive body, which plans, directs, approves, and monitors the work of the Ephorates and other services and secures their funding. A large part of the work of the Ephorates includes the supervision and control of modern technical or infrastructure works carried out in the environs (built or natural) of monuments. Monitoring takes place in every type of activity that could directly or even indirectly affect the archaeological sites, monuments, and places of historical interest. Most often, there is a demarcation of a broader area of protection, buffer zones, and specific land use. Excavations, conservation, restoration, rehabilitation of monuments, and their protection through shelters and other means, educational programs, and cultural events are controlled by the Archaeological Service, which examines the feasibility and extent of the intervention, quality of the work, scientific documentation and reversibility of the interventions, and guaranty of proper publication. The sensitization of the broader public is also important, and there is a lot of effort put in combining the needs of modern society with the benefits of a monument or site. There is always communication between the Archaeological Service and the competent authorities and social actors, especially concerning expropriations or compensation of the individual for the deprivation of use of immovable property for archaeological reasons. Expropriation takes place in recent years only when a group of monuments needs to be promoted and there is no other alternative for their preservation and enhancement or in case an extraordinary site is revealed. In the case of major public works, there is allocation of important funds for salvage excavations, conservation, preservation, storage, landscape design and promotion, and finally publication of the finds.

Among the activities undertaken abroad are archaeological missions and excavations in countries, where antiquities of Greek interest have been found. Control of the import, export, and transfer of cultural goods is strict in Greece and falls under the responsibility of the Directorate of the Management of the National Archive of Monuments, Documentation and Protection of Cultural Goods.

Because the Ministry of Culture places great emphasis on the fight against illegal excavations and the illicit traffic of antiquities, it has established the Department of Documentation, Illicit Trafficking, and Protection of Cultural Goods, which operates under the Directorate of the Management of the National Archive of Monuments, Documentation and Protection of Cultural Goods (http://www.culture.gr/el/ministry/SitePages/viewyphresia.aspx?iID=172). The general tasks of this Department is to deal with cases of theft and illegal commerce of artifact and antiquities, to keep the central departments informed about the current market prices of antiquities, to track the antiquities markets in Greece and abroad, and to inspect Auction' Houses abroad in order to localize stolen antiquities.

Issues concerning the private collectors and antique shops fall under the jurisdiction of the same Directorate and particular of the Department of Antique Shops and Private Archaeological Collections. In previous years, permits to form private collections were granted to possessors of antiquities of considerable number and scientific significance. Basic preconditions for acquiring a collector's permit were knowledge of the subject and the economic means to purchase important antiquities. A central idea, around which the creation of the collection evolved, was necessitated, as well as the unity of the collection. Collectors are obliged by law to declare their new acquisitions. Many of the earlier collectors have donated all or part of their collection to the state, and major public or semipublic museums were created.

Today provisions for the creation of a collection are very strict, as well as for its transfer or commercial disposition. The state always has first priority in acquiring objects from a collector or simple possessor of antiquities. Furthermore, the legislation stipulates that antiquities in the possession of any citizen, acquired through inheritance, purchase, or gift, must be declared to the abovementioned Department.

During the last years, Greece has been very active on the protection and promotion of intangible heritage. The competent Service in the Greek Ministry of Culture and Sports for all related issues is the Directorate of Modern Cultural Assets and Intangible Cultural Heritage. The UNESCO 2003 Convention for the Safeguarding of Intangible Heritage has offered a vitally important management tool for Greek authorities for the safeguarding and promotion of this particular aspect of our culture. Since 2013, Greece has made a significant progress in managing and promoting its intangible heritage according to the principles set by the abovementioned UNESCO Convention and has inscribed four elements on the Representative List of the Intangible Heritage of Humanity (Mediterranean diet, know-how of cultivating mastic on the island of Chios, Tinian marble craftsmanship, Momoeria-New Year's celebration in eight villages of Kozani, West Macedonia).

There are 18 foreign archaeological schools functioning in Greece, which carry out excavations and survey projects, either in collaboration with the Greek Service or on their own. They receive their permits under specific preconditions. They offer know-how; advanced technology; funds for expropriation of the land, on which they excavate; periodicals with annual publications and specialized libraries; as well as other benefits (Korka 2007). The foreign archaeological institutions in Greece function by decision of the Minister of Culture, after prior prescript of the Central Archaeological Council.

Greek university professors and other researchers also conduct excavations under the supervision of the service, which must control that all Greek and foreign excavators abide by the law and keep proper inventories in their storerooms along with digital photographs. Surveys and other nondestructive methods are encouraged, while excavation is conducted only when proven necessary.

This recent and innovative framework offers more flexible means and better possibilities for more immediate results. The targeted individual is also given motives to surrender antiquities and collaborate.

Greece has ratified almost all international cultural conventions and is signatory to most relevant instruments. Specifically, Greece has ratified the following conventions (Βουδούρη and Στρατή 1999: 1–92, 209–246, 391–422, 503–526):

- Hague Convention on the Protection of Cultural Goods in the Event of Armed Conflict (1954) and its two protocols 1954 and 1999 (Clément 1995: 133–150).
- UNESCO Convention on the Means of Prohibiting and Preventing the Illicit Import, Export, and Transfer of Ownership of Cultural Property (Paris 1970) (Askerud and Clément 1997).
- UNESCO Convention on the Protection of World Cultural and Natural Heritage (Paris 1972).
- European Convention on the Protection of Archaeological Heritage Revised (Valetta 1992).
- Convention on the Protection of Architectural Heritage (Granada 1985).
- UNIDROIT Convention on Stolen or Illegally Exported Cultural Objects (Rome 1995) (Siehr 1998: 617–689).
- Convention for the Safeguarding of Intangible Cultural Heritage (Paris 2003).

These conventions along with the application of international charters and recommendations are implemented by the Greek public administration and have enriched the existing legal framework giving it an international perspective and dimension.

Greece has inscribed 18 monuments and sites on the World Heritage list of UNESCO and 4 sites on the European Label catalogue. The law provides for the examination of every issue

concerning World Heritage monuments by the highest council in the Ministry (Korka 2004).

Furthermore, Greece has entered the European Union and has therefore incorporated EU directives in its legislation. The EEC Regulation 3911/92 concerning the export of cultural property is implemented in regard to customs issues, as it harmonizes export controls over cultural property outside the borders of the EU by establishing the procedure of granting an export certificate for these goods. Most important is the application of Directive 93/7/EEC of the Council on March 15, 1993, concerning the return of cultural goods unlawfully removed from the territory of a member state, the annex of which was modified by Directive 96/100/EC of the European Parliament and the Council on February 17, 1997 (Γραμματικάκη- Αλεξίου 2002: 274–299).

Greece participates in many international initiatives within the frame of Memoranda that has signed with many countries around the world. Among the joint projects undertaken in collaboration with the state parties is the organization of exhibitions in which Greek representative antiquities are included according to the thematic of each exhibition. The exhibitions "Greeks: from Agamemnon to Alexander the Great," hosted in USA and Canada, and "World of Emotions: Ancient Greece, 700BC-200AD," hosted in USA, are some of the most successful recent ones.

An exhibition on Egyptian culture and its influences on Greek and Roman civilization will also take place in 2018 at the Getty Center in Los Angeles, USA. The largest museums in the world will lend about 200 works for the exhibition "Egypt – Greece – Rome: Cultures in Contact," which deals with the relations that have developed between these three cultures, from the Late Bronze Age (1600–1100 BC) to the late Roman years, with a center of gravity in Egypt.

Based on intergovernmental memoranda, cross-cultural years have been established between Greece and other countries. 2016 was declared "Cross-cultural Year between Greece and Russia" and 2017 with China. Within this frame hundreds of events were organized each year in the fields of art, culture, sports, tourism, education, economy, agriculture, science, technology, etc. in order to further advance ties of friendship and cooperation between the two countries and to promote the cultural heritage of both.

Current Debates

In recent years, the ministry has focused on reorganizing and upgrading its museums. Most museums were site museums or in any case were continuously supplied with new material from the ongoing systematic or rescue excavations. A new tendency prevailed, however, and some museums became independent from the local Ephorate. The most advanced framework today is that of the New Acropolis Museum, which has an independent governing board appointed by the Minister of Culture (www.newacropolismuseum.gr). Management of museums has become more user-friendly to the public, and info-kiosks; educational programs; visitor facilities, especially for handicapped people; audio systems; and electronic entry machines are now available. Furthermore, many periodic exhibitions take place along with cultural events and educational programs, which bring the public closer to antiquities. Funding, in general, comes from the state and is boosted a lot with European development programs. There is a new law also encouraging sponsors.

An ongoing public consultation is in process in order to establish a specific accreditation procedure for museums according to the provisions set out by the Greek Archaeological Law (3028/2002). The whole idea is to obtain an effective system of control and evaluation of a museum carried out by a competent governmental body or a valid professional association of museums. Among the prerequisites that must be met in order for a museum to acquire the accreditation are the existence of an analytical collections inventory, the documentation of suitability and space adequacy and info on staffing, planning of actions, and the internal regulation.

The Archaeological Services are also updating the means of documenting and communicating knowledge by using modern technology. Within

this frame, the Ministry of Culture established the first organized, ongoing, and systematic digital registry of the country's immovable cultural property, called the "Hellenic Archaeological Cadastre." This project is an administrative tool that will be of great help to the services, saving human resources, but also an important scientific tool that will allow researchers to have clear and precise data about the cultural heritage of Greece.

Regarding the online information provided on issues of cultural heritage, there is an official website for the Ministry (www.yppo.gr) and for the Greek cultural heritage (http://followodysseus.culture.gr/en-us/home.aspx) which are continuously updated in order to provide to all viewers, experts or not, in an innovative and effective manner information about archaeological sites, museums and the collections, educational programs, art and festivals, and many other aspects of Greek cultural heritage.

In terms of managing cultural heritage, Greece has undertaken many initiatives in order to cope with the current economic conditions (Korka 2014) and to secure funds for the overall protection of its cultural heritage. Under this perspective, an effort is being made to improve the function of the authorities which are competent for economic affairs, the Archaeological Receipts Fund being the most important among them. The Fund is responsible for managing and distributing the resources stemming from ticket revenues and for the manufacture and promotion of cultural products. Despite the impact of the economic crisis which inevitable affects the function of the Fund, a coordinated plan is being implemented in order to reorganize its administrative and organizational structure thus securing the Fund's function and contribution to the protection of promotion of cultural heritage in the light of the new fiscal policy.

Future Directions

Greece participates in the UN, UNESCO, the Council of Europe, the UN Economic and Social Council, the EU instruments, and other international governmental and nongovernmental organizations with the goal to promote the protection of cultural heritage. Many exhibitions of Greek antiquities are circulated abroad in collaboration with major museums and cultural institutions all over the world. Through various initiatives and programs, the Greek Ministry of Culture and Sports wishes to enhance its heritage, strengthen its collaboration with cultural actors, and promote cultural and educational activities.

Greece acknowledges the role of culture for economic growth and sustainable development in accordance with the 2030 SDG Agenda. Large infrastructure technical projects have been or are implemented with the mobilization and cooperation of all stakeholders, public and private, domestic and international, as well as the strategic combination of all financial instruments and means. During the last decade, the Archaeological Service has undertaken extensive rescue excavations within the frame of major public works (road networks, metro works, etc.) as well as works to enhance and promote the important antiquities that have come to light. Throughout this experience, the Services of the Ministry of Culture have acquired the expertise and know-how for the implementation and management of such demanding projects.

Greece is playing an active role in programs and initiatives supported by the European Union and have participated successfully in nominations related to the European cultural heritage. Greek sites have been selected for their role in European History in both the European Heritage Label and the European Capitals of Culture.

On the occasion of celebrating 2018 as the European Cultural Heritage Year, Greece will host and organize a series of events and programs aiming in encouraging approaches to cultural heritage that are people-centered, inclusive, forward-looking, more integrated, sustainable, and cross-sectoral.

The scientific personnel of the ministry is open to exchanging expertise and collaborating with foreign colleagues. There is great concern about modern management problems such as cultural tourism, climate change, natural and human-provoked hazards, and sustainable development. At the time of writing, however, an economic crisis risks diminishing personnel, services,

projects, and cultural benefits, which had occurred due to great effort and years of dedication.

G

Greek Colonialism, Archaeology of

Kathryn Lomas
Department of Classics and Ancient History, University of Durham, Durham, UK

Introduction

From the mid-eighth century BCE onwards, Greeks began to migrate in significant numbers from Greece and the Aegean to many areas of the Mediterranean. By the sixth century, Greek communities had been established as far afield as Spain, Italy, France, North Africa, Asia Minor, and the Black Sea coast. This colonialism raises important questions about the processes of migration and the reasons for it. Other issues include the nature of interactions between Greeks and non-Greeks, the influence of colonialism on the

development of the Greek city, and whether settlement overseas impacted on expressions of Greek ethnicity. There is a high degree of local variation in the way these communities developed, but they highlight some central aspects of Greek archaeology. Greek cities continued to be founded outside Greece during the fifth to third centuries BCE, but these were rather different in character and this article will focus primarily on colonialism in the eighth to sixth centuries.

Definition

The definition of Greek colonialism is contentious. The Greeks had no word for "colony," referring to overseas settlements as *apoikiai* (literally homes away from home), or *emporia* (trading settlements). This distinguishes between independent Greek city-states (*apoikiai*) and trading communities – sometimes of mixed ethnicity (*emporia*). Until the 1990s archaeologists and historians largely accepted the terminology of colonies and colonization to describe the Greek diaspora of the eighth to sixth centuries BCE (Graham 1982; Dunbabin 1999). Recent scholarship has problematized these terms. They imply acceptance of ancient sources which present settlement as an organized state-sponsored act of colonization to an extent which is now no longer tenable. They are also shaped by analogy with eighteenth- and nineteenth-century imperialism and colonialism, which are not appropriate models to apply to Greek colonialism (Osborne 1998; Shepherd 2005). The terms "colony" and "colonization" have now been largely replaced by more neutral terms such as "settlement" or "migration." Where the terms "colony" or "colonization" are used in this entry, it should be understood that they are being used as a synonym for Greek settlements outside Greece and do not carry any implication that these settlements were the result of the structured state foundation of the type critiqued below. However, this is still a contentious issue, and as Malkin (2016) has argued, networks of contacts between so-called "colonies" and metropoleis, and rights of return from one to the other, suggest that the Greeks themselves saw the colonial relationship as meaningful.

Historical Background

Greek mobility in the Mediterranean has a long history. Mycenaean finds indicate contact between Greeks and other areas of the Mediterranean from at least the twelfth century BCE, and Greeks were a significant presence in ports such as Al Mina during the ninth century (Boardman 1999). By the mid-eighth century BCE, the size and importance of Greek settlement increased markedly. Between c. 750 and 650 BCE, Greek settlements were established at many locations on the coasts of Sicily, southern Italy, and Campania. During the seventh and sixth centuries, numerous settlements developed in the northern Aegean and the Black Sea area, north Africa, the Dalmatian coast, and coastal Asia Minor. There was also further sixth-century settlement in Italy, Spain, southern France, and on some of the islands of the western Mediterranean. Finally, a number of settlements were founded in Italy, Sicily, and the Black Sea area in the fifth and early fourth centuries (Figs. 1 and 2; Osborne 1996: 119–129). The settlers were drawn from many different areas of the Greek world. Ancient sources attribute notional founding cities or regions to each colony, and relationships, but they are based largely on fictive rather than real kinship. Many settlements have yielded finds from many areas of the Greek world in their early phases, suggesting mixed groups of settlers from several areas of Greece.

In addition to self-identified Greek colonies, there were many Greeks living in indigenous communities (Lomas 2006). In Spain, only two Greek cities – Emporion and Rhode – were established, but seventh- and sixth-century Greek pottery and amphorae found around Tartessos suggests large-scale trade between Greeks and Iberians. Inscribed Greek personal names from Iberian contexts demonstrate the presence of Greek people as well as Greek goods, and a fifth century inscribed lead tablet from Pech-Maho records a complex commercial contract involving both Greeks and Iberians. The Greek presence in

Greek Colonialism, Archaeology of, Fig. 1 Greek colonial settlement in the Western Mediterranean

Spain was extensive but did not take the form of city-foundation and has been termed colonialism without colonization (Dominguez Monedero 2002, 2004).

The motives for Greek migration are unclear. The large quantities of Greek goods circulating throughout the Mediterranean area suggest a connection with trade, and the nature of the earliest settlements supports this. Pithekoussai (modern Ischia), established c. 750 BCE, was located on an off-shore island, in close proximity to a major trade route linking Italy and Sardinia with Cyprus and Greece. Grave goods from the settlement include pottery from many parts of the Greek world, along with Italic fibulae, Egyptian scarabs, and Phoenician artifacts. Remains of smelting furnaces and waste metal indicate that the smelting of iron ore from Etruria was an important activity (Ridgway 1992). Trade, particularly in metals, was a key activity as well.

Colonialism is often presented as the result of a desire for land, prompted by demographic pressure (Graham 1982: 83–94, 157–159; Dunbabin 1999: 1–47), but this is questionable. Although some settlements had abundant supplies of fertile land, others did not. Settlements on the "instep" of Italy controlled large amounts of land, as did those of south-east Sicily, but other colonies seem to have had different priorities. Rhegion, Taras, and Massalia had good harbors and strategic positions on trade routes. Others, such as those on the Calabrian coast, were in areas that were not attractive to those mainly seeking land. Evidence for demographic pressure in Greece which might have forced Greeks to migrate is also ambiguous. Increases in the size of cemeteries in the eighth century demonstrate that the population was growing (although it also reflects changes in funerary customs) but not at a rate to force mass migration. A survey of Megara Hyblaia and its colony Selinous, designed to test the hypothesis that migration, was driven by demographic expansion and need for land, conclusively demonstrated that in this case, it was not (De Angelis 1994). When Selinous was founded, c. 650 BCE, Megara had a plentiful supply of land and no sign of demographic pressure. Ancient sources attribute colonialism to specific factors such as drought, famine, and political strife, rather than a specific desire for land.

Greek Colonialism, Archaeology of, Fig. 2 Greek colonial settlement in North Africa, Asia Minor, and the Black Sea area

The answer may lie in the fact that the eighth to seventh centuries BCE were periods of great personal mobility, driven by a variety of factors. It has been described as an era of exploration, in which Greeks moved to exploit a range of new social and economic opportunities (Purcell 2005).

The colonialism of the period may have been driven by a mixture of commercial motives, opportunism, and curiosity about the wider Mediterranean world, rather than by demographic pressure and lack of land.

Between c. 720 and 600 BCE colonial settlements show a high degree of local variation in their development. Some were ethnically mixed communities and many others may not have been fully urban in their early stages. By the end of the seventh century, most had established themselves as fully urban and fully Greek settlements. Many developed organized urban plans to a much greater extent that cities in Greece and did so from an early date. This so-called Hippodamian town plan was based around two main thoroughfares crossing at the center of town and a grid of streets dividing the area into long rectangular blocks, which were subdivided into regular plots for housing. The agora was usually placed near the center of the urban area. Temples and sanctuaries could be grouped together on an acropolis (as at Akragas), placed at the edges of the urban area (as at Poseidonia), or a mixture of both. However, there were many local variations in the ways sites developed. At Megara Hyblaia, the regular layout seems to have been in place from the earliest date of settlement, with designated areas for cemeteries and sanctuaries and for public business. The uniformity of the early houses in size and form suggests a high degree of central organization in allocating space. At Thasos, in contrast, pottery deposits demonstrate that sanctuaries were established early, but the seventh-century city was haphazard and the first signs of communal planning and organization date to the early sixth century (Osborne 1996: 233–242).

Greeks overseas were early adopters of many aspects of Greek urban life. Colonies built monumental stone buildings earlier and more prolifically than the cities of Greece; in particular many monumental temples were constructed. Coinage was adopted early, as were writing and codified laws. Territories were also carefully organized. During the sixth century, the territory of Metapontion was systematically reorganized and a regular grid of land divisions imposed (Di Siena 2001: 24–29). The fact that these were new communities may have prompted this investment in civic infrastructure. Unlike cities in Greece, which had grown up piecemeal, developments on new sites could develop more systematically and also a need to create strong civic organization and a strong civic identity to integrate the inhabitants into a functioning citizen body.

Ancient sources describe ethnic conflict between Greeks and their non-Greek neighbors, but archaeological evidence presents a more nuanced picture. Some settlements started out as mixed communities before adopting a fully Greek identity during the seventh century. Graves at Pithekoussai have yielded Italic and Phoenician grave goods, suggesting an ethnically mixed rather than purely Greek community (Ridgway 1992: 109–119). At Metapontion and Siris, Greek and Italic burial customs co-existed in earliest phases of the cemeteries, and both Greek and non-Greek pottery have been found, although buildings are mainly of Greek type (Carter 1998; Di Siena 2001: 17–26). This persists until the late seventh century, after which these sites become more clearly Greek in character. This is accompanied by changes in the territories of these communities, which may suggest a phase of more aggressive expansion (Di Siena 2001: 24–31). One hypothesis is that many Greeks arrived in all-male groups rather than as families and intermarried with the local populations, although studies of this in the western Mediterranean have shown mixed results (Shepherd 1999). At Pithekoussai, Metapontion, and a number of other sites, some female burials contained Italic fibula brooches rather than the straight dress-pins used by Greeks, suggesting that these may have been local women. As there was no spatial distinction between these and graves with Greek grave goods, they have been taken as evidence for women intermarrying with Greek colonists. At other Greek sites, however, there is little evidence of ethnic intermingling, and patterns of interaction with local populations varied from colony to colony.

Whatever the specific nature of social relations, there were significant levels of economic and cultural contact and exchange of goods and ideas between Greeks and non-Greeks, even during

periods of conflict. Religious sanctuaries seem to have acted as important points of contact for such exchanges. Greek inscriptions are found in non-Greek contexts; the Greek alphabet was adopted for writing non-Greek languages and coinage based on Greek designs and weights was minted by some non-Greeks. Greek pottery styles were also widely adopted, and adapted by non-Greeks, often from an early date. In Italy, for example, Apulia, Lucania, and Campania all developed local red-figure pottery, closely based on Greek techniques and designs but with their own distinctive shapes and decorative styles. In extreme cases, it can be difficult to distinguish between Greek and non-Greek settlements. The Sicilian city of Segesta constructed a fine Doric temple, despite being an indigenous community. At Morgantina in southeast Sicily, a settlement of the indigenous Sikels, the center of the city had Greek-style buildings and looked very similar to the agora of a Greek city, despite its non-Greek population (Antonaccio 2005: 98–101). The social and cultural interactions between Greeks and their non-Greek neighbors were both highly complex and central to the development of areas of Greek settlement.

The Greeks of the colonial world were not a cohesive group and are evidence of tension, sometimes on ethnic lines between those of Dorian and Ionian origin. Despite this, they maintained a strong Greek identity. Greeks overseas participated in events symbolizing shared ethnicity, such as the Olympic games and other Panhellenic festivals. The victory lists at Olympia and other sanctuaries include victors from the colonial world. Colonies built treasuries at Delphi and made victory dedications at Delphi and Olympia. Although founding "mother-cities" are likely to have been largely fictive, social and political links between a colony and its putative founder were important. Cults associated with the foundation formed a vital part of civic religion in the colonial world, whether they were cults of deities associated with colonialism, cults of a heroized founder, or cults associated with the nominal mother city. It was also common for colonies to adopt the linguistic dialect and form of script used by their assumed mother city and to use the same weight standard for their coinage. Although these relationships were largely based on fictive rather than real kinship, they became more prominent, and more politicized, from the sixth century onwards. The colonies founded by Phokaian refugees after the Persian sack of Phokaia – Alalia, Elea, Massilia and Emporion – shared a strong sense of common Ionian identity, maintaining their Ionic scripts and dialect, and many aspects of architecture and material culture derived from Phokaia (Dominguez Monedero 2002, 2004), while Korinth maintained active links with states which claimed Korinthian origin during the fifth century. Greeks outside Greece were embedded in a complex web of connections to both their non-Greek neighbors and the wider Greek world.

Key Issues/Current Debates

There are currently several key issues in the archaeology of Greek colonialism. These include the nature of the process by which new communities were created, the reasons for the migrations of the eighth and seventh centuries, the interpretation of relations between Greeks and local populations, and the impact of colonialism on Greek conceptions of their own ethnicity. They touch on important problems such as how (or if) archaeological evidence can be integrated with ancient sources, whether we can identify ethnic origins from material evidence, and what sort of analytical frameworks can be used to clarify cultural interactions between Greeks and their neighbors.

Trade and Colonialism

Discussions of mass migration in the eighth and seventh centuries BCE historically assumed that trade was of relatively little importance and the main motivation was desire for land (Boardman 1999; Dunbabin 1999). This was, in part, based on a tendency to privilege the ancient sources over material evidence. Accounts which mentioned desire for land as a motive (Strabo, *Geography*, 5.4.9) or drew distinctions between mercantile Phoenicians who founded trading posts and Greeks who founded cities (Thucydides 6.2) were largely accepted. It also relies on a

primitivist view of ancient Greek economies in which trade is assumed to be of little importance. Recent critiques demonstrate that this approach was shaped by eighteenth- and nineteenth-century colonialisms, in which trading relationships were rapidly followed by territorial expansion. New research on the economy of the archaic Mediterranean suggests that economic behavior was much more sophisticated and diverse than this model suggests and that nineteenth-century concepts of "trade before the flag" distorts both the nature of ancient trade and that of the settlement process (Shepherd 2005: 24–30). The excavations at Pithekoussai show that it was a community with a vibrant economy based on trade in mineral resources as well as agriculture. The archaic Mediterranean was a region of high mobility, in which long-distance travel motivated by commercial opportunities and curiosity about an expanding world, was not unusual (Purcell 2005). Network theory is proving to be a valuable tool for examining Mediterranean-wide commercial and cultural contacts and has underlined the high degree of mobility and interconnectedness in this period of Greek history (Malkin 2011).

The Nature of Settlement

The process by which settlements were established has generated much debate. Until the 1990s, ancient accounts of how to found a new settlement were largely accepted (Graham 1982). These present colonization as a well-defined and organized process, whether carried out by a state or an individual. An oracle was consulted to gain divine approval for the mission, leaders were appointed, and the colonists set off to find the place indicated by the oracle. Once located, the leaders laid out the boundary of the new city, instituted the main cults, and divided the land within the new city and its territory to ensure that settlers received a fair share. The foundation process was presented as setting up a community to a recognized pattern, replicating the organization of a Greek *polis*.

There are many problems with this model. The texts on which it relies were written long after the foundation of the early colonies, reflecting later practices and attitudes, and cannot be accepted as an accurate account of how colonies were established. In addition, ancient sources and archaeological evidence address fundamentally different questions (Owen 2005: 6–8). Archaeology reveals long-term trends and patterns, but dating is too imprecise to pinpoint short-term factors. Ancient sources, in contrast, focus on immediate events and motivations. Both yield valuable information, but from radically different perspectives. Recently, the debate about the nature of Greek settlement overseas has swung strongly against the model of colonization as an organized political project. Many scholars now regard it as a fluid process, in which Greek settlements formed by piecemeal migration by individuals and small groups, some of whom initially lived in mixed communities alongside indigenous populations. Many did not develop a fully Greek identity and city-state organization, either by assimilating or ejecting these local populations, until the late seventh century.

This view is strongest in Anglo-American scholarship, where the use of the term "colonization" to described Greek settlement overseas has become problematized, but it is not universally accepted. One of the key arguments against the organized foundation of colonies is that the city-state was at an early stage of development in Greece in the eighth century and that the *polis* was not yet established as the main form of political and social organization, so the creation of new settlements which replicated this emergent form of organization seems unlikely (Osborne 1998). However, counter-arguments have been made, that the development of the *polis* was assisted precisely by colonization and the need to create new forms of community from scratch and that there is nothing implausible about a new society inventing new forms of community and new ways of setting them out (Malkin 1994, 2002). Although the balance has tipped in favor of Greek settlement overseas as a process of migration rather than organized colonization, there are still ambiguities to resolve.

Modeling Cultural Interactions

The concept of Hellenization – the adoption, either voluntary or enforced, of Greek customs,

language and material culture by non-Greeks – has long been the dominant model for understanding Greek relations with local populations. It is an analytical framework shaped by eighteenth- and nineteenth-century colonialisms, in which a mission to civilize non-European cultures was an important part of colonial ideology (Shepherd 2005). However, it is no longer tenable to view the archaeology of areas of Greek settlement as shaped by a one-way transmission of advanced Greek customs and culture to more backward locals. Instead, various analytical models have been put forward to interpret relations between ethnic groups.

A core-periphery model, in which the Greek core obtained natural resources such as mineral ores from the non-Greek periphery in exchange for Greek manufactured goods, is one possible approach. This argues that Greek goods were circulated to non-Greek elites, by either trade or gift-exchange, in return for resources such as mineral ores. These goods were regarded as prestige items, the ownership of which enhanced the status of the non-Greek owner and also his/her social and political power (Dietler 1995). This opens up alternative ways to look at trade and exchange of goods and also gives the local population a more dynamic role in the relationship, but it also implies the same basic level of inequality between non-Greeks and Greeks which characterized the Hellenization model.

Postcolonial theories of hybridization and Middle Ground theory offer a possible alternative. These argue that interaction between Greeks and non-Greeks resulted in the emergence of hybrid (or creole) culture which contained elements of both cultures and which facilitated the development of local and regional identities which were not Greek or non-Greek but Sicilian, or Italiote, or Graeco-African, etc. (Antonaccio 2005). A site such as Morgantina, where there is evidence of the adoption of at least some Greek customs (e.g., Greek civic architecture) but not others (Greek religious architecture, Greek sculpture), is not an example of Hellenization but of an expression of local Sicilian identity in which Greek and Sikeliote elements mix to produce new cultural forms. One strength of this model is that it allows for changes in the ways in which artifacts are used. For example, Greek drinking vessels are frequently found in elite burials in many areas of Italy, but they do not prove the adoption of the Greek *symposion*. Most Italian societies had their own traditions of elite banqueting, which were very different from that of the all-male *symposion*, and it is far more likely that Greek drinking sets were used for these local celebrations. Although Middle Ground theory and hybridization escape from the overtly top-down and colonialist aspects of Hellenization and core-periphery analysis, they are still problematic as a framework for studying Greek-local interactions. Recent critiques note that they potentially underplay aspects of conflict or imbalances of power between the parties involved. They can also make it difficult to differentiate between the various cultural elements under discussion and can obscure important factors such as gender or social class, which have an important role in determining which cultural features are transmitted and how they are used.

Another influential approach has been examination of Greek and non-Greek cultures in terms of localism versus globalization (Hodos 2009). The spread of Greek culture over such a wide area of the Mediterranean meant that Greek customs and artifacts could be used as a form of cultural lingua franca, just as the Greek language could be used as a common language to communicate across ethnic and cultural boundaries. Greek red-figure pottery, for example, could be customized with local scenes and therefore used to present local identities in a visual idiom which was familiar throughout the Greek world. South Italian red-figure vases frequently depicted scenes of warriors in local costume and with Italic armor and weapons, using it to present local elite culture. Greek culture could be seen as a form of globalized cultural language which could be customized to reflect local cultures but also used as a form of communication across cultural boundaries.

Ethnicity and Colonization

The role of colonialism in the development of Greek ethnicity, and how reliably we can identify ethnicity in the archaeological record, is an important issue. Distance from one's own culture or

proximity to other cultures is frequently a factor in the emergence of a stronger and more assertive sense of ethnic identity. Ethnicity is often more in evidence in frontier areas where cultures are in contact, and for this reason, it has been suggested that Greeks living in colonies may have had a stronger sense of Greek identity. This oppositional Greek identity, and the polarity between Greeks and barbarians, is, however, more developed in the sixth century, when networks of Panhellenic sanctuaries and festivals had become securely established, and in the fifth century, when Greek identity was tested by the Persian invasion, than it was in the archaic period. It has been argued that Greeks of the eighth and seventh centuries may have been more aware of the differences between settlers from different parts of Greece as between themselves and neighboring non-Greeks (Hall 2002).

There is evidence for both points of view. Greeks outside Greece were not a cohesive group. Evidence of regionalization is apparent in their use of different alphabets and dialects, and they seem to have maintained subgroup identities as either Dorians or Ionians. The mixed communities found in some early settlements, and evidence for commercial, social, and even familial contacts with non-Greeks, suggest that ethnic boundaries were flexible. However, there are methodological problems. The hypothesis that Greeks and non-Greeks intermarried is based on presence of certain artifact types in funerary assemblages, but possession of local objects may be a matter of taste, patterns of trade or gift-exchange, or simply what was available, rather than an indication of ethnicity (Shepherd 1999). The presence of other evidence such as the use of non-Greek burial customs in a Greek city strengthens the case for mixed communities but inferring a mixed population on the basis of grave goods alone is unwise. As with most aspects of Greek colonialism, patterns were geographically and chronologically varied. Relations with locals differed from colony to colony, and Greek identity became more sharply defined from the fifth century, but it was never a simple matter of Greeks versus barbarians.

International Perspectives

Greek colonialism is hugely varied, with many local variations in the development of Greek settlements outside Greece. Some regional patterns can be discerned: settlement in Spain and the islands of the western Mediterranean seems to be less *polis*-based and more integrated with local populations than elsewhere, and the emergence of regional styles in material culture can be identified, but there is also intense variability of development even between settlements in the same areas of the Mediterranean. This has been exacerbated by some trends in modern scholarship. There has been a tendency for researchers to focus on specific regions and sites, and dialogue between these has sometimes been limited. One of the key challenges in the archaeology of Greek colonialism is to identify overarching themes and patterns in colonial settlements without losing sight of these local factors.

Future Directions

There are many important issues which remain to be explored in relation to Greek colonialism.

1. Better methodologies for integrating archaeological and textual evidence are badly needed. Historians frequently privilege texts over material evidence, while some archaeologists adopt the extreme position that textual evidence should be rejected entirely. Dialogue between archaeologists and historians is essential for the resolution of this problem.
2. Further research on cultural identities and the interactions between Greeks and other ethnic groups is needed. This is a complex area, and none of the models review above are without their problems. A single interpretative framework which will address cultural interaction without any bias or distortion may be difficult to achieve. In particular, more investigation is needed on how factors such as gender or social class may shape cultural interactions. There is much scope for the development of new models of cultural interaction which

place Greeks and non-Greeks on a more equal footing.

3. Better integration between researchers working on different areas of the Greek colonial world is required. As noted above, Greek experiences of colonialism were often locally specific, but more dialogue between researchers working on different areas of the Greek world may help to illuminate aspects of colonialism. Recent research applying network analysis to the ancient Mediterranean has opened up valuable new approaches to aspects of colonialism and connectivity between different areas of the Greek world. A recent conference (Donnellan et al. 2016) has highlighted the need for greater dialogue between researchers from different fields of study and different national traditions.

Greek Houses, Archaeology of

Barbara Tsakirgis
Department of Classical Studies, Vanderbilt University, Nashville, TN, USA

Introduction

Most visitors to Greek archaeological sites can be excused if they never visit the residential districts or even realize that houses have been excavated there. Greek domestic architecture is often poorly preserved and consequently neglected by countries that have more cultural property to protect than their budgets will cover. This situation is regrettable, as houses and their contents can reveal much about the cultural and social life of the Greeks, providing an insight on the economy, religion, relationships between men and women, and the interactions between freemen and slaves. Careful examination of the archaeological remains, informed by a judicious reading of ancient literary and epigraphical testimonia, and cautious use of ancient visual depictions of domestic scenes can help bring Greek houses to life.

Definition

What are the determinants for identifying a house and for labeling that house as Greek? The first question can be difficult to answer, as many excavated buildings were both residences and the locations for industrial or commercial activity. It is probably most accurate to say that a house was a building where the primary function was residence but where there could be attendant workshop production and/or commercial sales. A number of Greek houses accommodating such multiple uses have been recognized in rural settings and almost by definition include agricultural or pastoral production. The identifying characteristics for a domestic use of space are as much the artifactual assemblages as the architectural structure. The collections of household impedimenta reveal the human use of space within, including food storage, preparation and consumption, as well as sleeping, household production such as textile work, and the entertainment of guests. The answer to the question of Greek identity is dependent in part on chronology. From the Early Iron Age until the late fourth century BCE, it is fair to say that a Greek house is a residence constructed in territories established and occupied by Greeks, who identified themselves as such by virtue of their common language and the gods they worshiped. This definition follows Greek ideas of self-identification which were based on language and religion (see, e.g., Herodotus 8.1.44).

Historical Background

The houses considered in this entry date over the course of a single millennium, from c. 1,000 BCE until the first century BCE. While Greek speakers were resident in the Balkan Peninsula, the homeland of Greece, from before 1,500 BCE, the governing political and economic structure of the Greek Bronze Age was such that the house types of that period were shaped by factors very different from those in the succeeding Iron Age when social changes fundamentally altered the forms of domestic architecture. The study of the Greek house is inextricably bound to the study of urbanism in the Greek world, as domestic architecture responds to the organization of the city in its adherence to the street system; the interior arrangements of the house also recognize the interplay between the interior, with any attendant

notions of privacy or segregation, and public life in the city.

Throughout the Greek world, Early Iron Age houses were limited in both size and elaboration. Houses of one, two, or at most three rooms were the norm whether the houses were built on the Greek mainland or in the colonies that multiplied, especially in the western Mediterranean, from the late eighth century BCE. The techniques of construction that prevailed throughout history seem to have originated at an early date – mud brick walls were built on a low stone socle in order that the easily fashioned mud brick could provide insulation and so that the stone underpinnings could prevent moisture from destroying the mud brick. Early Iron Age houses usually had fixed hearths to serve as a heating element and probably also as a source of light, a space for cooking, and a focus of family life and ritual (Tsakirgis 2007).

Another characteristic feature of Greek houses also emerges early, that is, their southern orientation. Doors and windows were often placed to open to the south so that the rays of the winter sun shining low would penetrate the rooms and warm them and so that the summer sun, high overhead, would beat on the roof, thus providing much needed shade in the hot season. This environmentally conscious architectural arrangement is seen equally in the early colonial houses at Megara Hyblaea in Sicily, in Classical houses in Athens (Fig. 1), in the Late Classical houses at Olynthos (Fig. 2), and in the Late Hellenistic House on the Hill on Delos (Hoepfner and Schwandner 1994: 4; Trümper 1998: 211–212; Cahill 2002: 75). The archaeological evidence for the practice of southern orientation predates by several centuries the testimony of the fourth century authors Xenophon (*Mem*. 3.8.8–9) and Pseudo-Aristotle (*Oec*. 1345a), both of whom prescribe that houses should be built facing south.

In front of, generally south of the earliest Greek houses, there is evidence of an open yard. Given the usually limited size of these houses, the unroofed area greatly increased the household's living area. At sites such as Zagora, the yard was shared, suggesting familial or social relationships among the families who resided in the surrounding homes (Hoepfner 1999: 163–169). No architectural embellishment of the early yards exists, although the overhanging eaves or shaded porches in front may have anticipated or given rise to the roofed porticoes of later houses.

Greek houses increased in both size and architectural complexity in the sixth and early fifth centuries BCE, as cities expanded in economic and political complexity. The open yard, formerly in front of the house, was in many cities at this time enclosed within the architectural structure, creating an unroofed courtyard surrounded by rooms. The plans of Late Archaic houses at Athens reflect this change. Entrance to the living space was no longer through the yard but rather through a door in the façade and often into a vestibule, creating what has been called the single-entrance courtyard house. Unlike the foyer of a modern home, the vestibule of the Late Archaic and Classical houses was a buffer, separating the public world of the street from the domestic world, and there was neither easy physical nor direct visual access to the innermost parts of the house because the interior doorway of the vestibule was not placed directly in line with the street entrance (Fig. 1). These architectural changes have been recognized as reflecting changing social practice in Greek cities and houses, a subject that will be discussed in more detail below (Nevett 1999: 103).

In many houses of the fifth and fourth centuries BCE, the unroofed courtyard was located fairly centrally (Figs. 1, 2, 3, and 4). Judging from the materials found in Greek domestic courtyards, many and varied activities took place there over the course of a family's life, including food preparation, ritual events, and probably activities that leave no archaeological record, including children's play. Since the courtyard was unroofed, light and air would penetrate into the surrounding rooms through both doorways and windows, as can be seen in better preserved Hellenistic houses at Iaitas and Delos (Dalcher 1994: 29–32; Trümper 1998). The courtyard was the major node of access to all of the surrounding rooms. Suites exist in Greek domestic architecture, but passage through several rooms was not common, and almost all parts of the house opened directly onto the courtyard. Because of this arrangement, it

Greek Houses, Archaeology of, Fig. 1 Athens, industrial district, houses C and D, plans. (Permission: Athenian Agora excavations)

has been argued that the courtyard also enforced social control, as any inhabitant would have to pass through the courtyard on the way to any other room or to the street door of the house (Nevett 2010: 49).

The courtyard served the crucial purpose of housing the domestic water source. While running water from springs was preferred for drinking and was collected from fountains close to residential districts, wells were dug in or near Greek houses from a very early date. In the Late Classical period, the Greeks came to prefer cisterns to wells as domestic water sources, and one or more of these storage tanks were dug under the courtyard. The cisterns were usually bottle shaped but larger scale tanks were excavated under the

Greek Houses, Archaeology of, Fig. 2 Olynthos, House of Many Colors, plan with distribution of finds. (Permission: Nicholas D. Cahill)

houses on the dry Cycladic island of Delos and at Soluntum in Sicily (Wolf 2003: 93). The terracotta roofs of the houses were sloped to shed the rainwater into the courtyard, where the runoff would fill the cisterns (Fig. 4). The paving of Greek domestic courtyards further facilitated and maximized the water collection, and gardens were not planted in courtyards until the Hellenistic period and then only rarely (see, e.g., the House of the Arched Cistern, Tsakirgis Forthcoming).

Beginning in the Classical period, there is increasing evidence for a shed roof built on one or more sides of the domestic courtyard. The roofs were supported on a row of pilasters or columns, but peristyles running around all four sides of the court were not common until the fourth century BCE. The covered porticoes provided shelter for the inhabitants to sit or work out of the elements while still enjoying the light and air. Depending on the time of day and the season of the year, the

Greek Houses, Archaeology of, Fig. 4 Athens, House of the Greek Mosaic, reconstruction drawing. (Permission: Athenian Agora excavations)

porticoes also provided shade to the surrounding rooms. The shade could keep the inhabitants cool in the summer and the contrast between the bright exterior and the darker interior could increase the privacy of those within.

What we learn from the domestic assemblages recorded at Olynthos, Halieis, Halos, and elsewhere is that the Greek house was characterized by a considerable flexibility in the use of space (Cahill 2002; Ault 2005; Reinders and Prummel 2003: 284–294). The rigid identifications and specific functions of rooms in modern houses were not a feature of ancient domestic space. This flexibility was enhanced both by the furnishings in Greek houses, which were fewer than those we are accustomed to today, and also by the portability of many of the household objects, including the charcoal brazier and beds.

In the later fourth century BCE, houses increased significantly in size and in interior decoration. It has been theorized that the breakdown of the traditional Greek polis turned the Greeks to the home as a location for the types of social interaction that had previously taken place in public settings (Walter-Karydi 1994). From this date, many houses throughout the Greek world were built with two courtyards, one of which served as the hub of a nexus of rooms devoted to private domestic activities, while the other was the centerpiece of large and well-decorated rooms intended to be seen and used by guests. As will be discussed below, not all could afford such expansive living space, but those who could would decorate their homes with mosaic floors and painted wall plaster (Fig. 5). Hellenistic houses in both this extensive plan and highly

Greek Houses, Archaeology of, Fig. 5 Morgantina, House of Ganymede, mosaic of Ganymede. (Permission: Princeton University, Department of Art and Archaeology)

embellished interiors may have been influenced indirectly by the palaces built by the Macedonian kings and their successors and the importation of ideas of private luxury from the newly Hellenized east.

Key Issues/Current Debates

There are many aspects of Greek houses that have led to scholarly studies; the following section highlights several that have garnered the most attention and others which have attracted recent attention: typology, gender, economy, and regional variation.

Typology

Early studies of Greek houses focused on establishing typologies, emphasizing one feature over another as important in the layout of the house. Many of these early works are barren, as they focus solely on establishing typologies of house form. Of particular note in these typological studies was the distinction made between the *pastas* and the *prostas* house. Both terms derive from the same passage of the Roman architectural historian Vitruvius (VI.7.1), who wrote in the first century BCE that the porch-like area mediating the transition between the courtyard of the house and its main rooms was called by some Greeks the *pastas* and by others the *prostas*. The excavators of the 102 houses at Olynthos adopted the first term for the wider northern portico of the central courtyard (Fig. 2), while the excavators of the nearly contemporaneous houses at Priene adopted the second term for the columned porch serving a similar but limited function in front of the main room of the house. The arrangement of porch and rooms at Priene was limited to some houses in the eastern Mediterranean and possibly derived from the *megaron* form common in Bronze Age architecture. The typical *megaron* includes a main living room with a front porch, often facing south, and an overall axial approach, that is, direct line of access from the porch to the main room. In many Late Classical and Hellenistic houses the portico on the northern side of the courtyard was wider than any of the other three and can be seen as a survival of the earlier *pastas* form.

These earlier studies in terminology and typology have recently been supplanted by more nuanced considerations which have attempted to understand the use of space in the Greek house. These later studies stem ultimately from an attention to research on domestic architecture conducted by anthropologists and prehistorians who have not relied solely on literary sources for their interpretation of the use of space in the dwellings. Ultimately the more recent analyses have been of greater value in explicating life in

the Greek house as scholars have based their ideas more on the humble objects of the domestic assemblages than on the textual sources (e.g., Xenophon. *Oec*. or Lysias 1), some of which are highly idealized accounts of Greek private life.

Gender

A critical area to be understood is how Greek houses were used by women and men in the course of their daily lives. In the past it was held to be true that women were secluded in quarters separate from those of the men, and because physical proof of this separation is difficult if not impossible to recognize in the remains of houses, the women's quarters were conveniently assumed to have occupied the upper, now destroyed, story. The living arrangement in the Greek house was doubtlessly far more nuanced than was earlier believed. The vestibule, as described above, allowed for a separation of the private from the public and ensured that the family, in particular its female members, were kept apart from men to whom they were not related.

The parts of the house where women lived and worked cannot be recognized as separate from that of the men's quarters because women probably used all or almost all of the house throughout the day. What remains to give testimony of their daily lives is the household equipment used by them as they tended to domestic affairs. For Classical Athens these activities can be recognized in the highly idealized *Oeconomicus* by Xenophon. The unnamed bride in this account oversees the domestic activities, including cooking, textile work, management of the slaves, and the safekeeping of the family storerooms. It is not clear how much the wife in question actually participates actively in the housework.

Food was cooked for the family or for the male guests dining in the *andron* in any one of several locations. Terracotta braziers which burned charcoal were commonly used for heating and cooking and were small enough to be moved from one part of a house to another, thus reinforcing the flexible use of space (Fig. 6). Much cooking was likely done in the courtyard, where smoke could be easily evacuated through the unroofed space. Some houses may have allowed for food preparation in the anteroom of the *andron* (Fig. 2, rm. f), in order to facilitate the presentation of the hot dishes to the guests. In many later houses, a fixed hearth was never built, and its role as heat source, cook stove, and locus of ritual was accomplished by the humble brazier. Some houses, especially in northern Greece, continued to have fixed hearths: for example, less than a quarter of the houses at Olynthos (Fig. 2, rm. k), as well as at Orraon, and in one house at Kassope (Hoepfner and Schwandner 1994: 146–149). Many of these domestic hearths preserve no traces of bones or other food stuffs, and they probably served instead as gathering points for the family and as sources of heat, light, and ritual activity rather than as cook stoves. In the later Classical and Hellenistic periods, purpose-built kitchens became more common and at Olynthos, flues were constructed in part to evacuate the smoke from cooking (Cahill 2002: 139).

Greek Houses, Archaeology of, Fig. 6 Eschara-type brazier (Agora P 21956). (Permission: Athenian Agora excavations)

Weaving is presented in the literary sources as quintessentially women's work, but the *histeion* (loom room) as referred to by Menander (*Sam*. 19) appears to mean not a dedicated room but rather wherever the warp-weighted vertical loom was erected. As the loom was fashioned of wooden beams, none survives, but the terracotta weights do, and they are found everywhere in Greek houses, showing that looms could be erected wherever the weaver chose (Fig. 7). Store rooms (*pitheon*, *tameion*) can be identified by a concentration of storage jars (*pithoi*) or amphorae, but many houses lack traces of these terracotta vessels

Greek Houses, Archaeology of, Fig. 7 Athens, house C, collection of loom weights, spindle whorl, rim of brazier. (Permission: Athenian Agora excavations)

and may have had provisions stored in now disintegrated cloth or leather sacks and baskets.

The upper stories of classical Greek houses are better known from literature than they are from material evidence and in his first forensic speech, Lysias (1.9) locates the women's quarters of an Athenian house on the upper story. The layout of the rooms mentioned by Lysias and whether they were dedicated only to the housing of women are much disputed by scholars of Greek private life. The northern rooms of classical houses at Olynthos are restored with upper stories that were approached by staircases rising from the domestic courtyard. The upper story was a feature in many Hellenistic houses such as Peristyle House I at Iaitas and most of the houses on the Aegean island of Delos (Dalcher 1994; Trümper 1998: 90–106). In contrast to the assumptions about the use of the upper rooms as women's quarters, domestic assemblages show that they could serve a variety of functions, including the men's office, as in the House of the Seals in Delos (Siebert 2001: 91). Many rooms on the upper floors of Hellenistic houses were no less well decorated than those on the lower story indicating that they were to be seen by guests. One upper room in Peristyle House I at Iaitas was a dining room, paved with mosaic rosettes and an inscription set in *opus signinum* (Brem 2000: 98–100, 116).

A characteristic room in many Classical Greek houses is the *andron*, used primarily as a setting for entertaining male guests. Purpose-built *andrones* appear in Classical houses at Priene,

Athens, and Olynthos (Fig. 2, rm. d), but many houses do not contain a room intended solely for hosting the symposium. Men could lie on couches or mattresses around any room and eat or drink wine, so a house without an *andron* is not necessarily a house where the symposium did not take place. Rooms built to function primarily as *androne*s were usually square, with an off-center doorway, so that the maximum number of dining couches could be placed against the walls; a raised platform for the couches was common in the Classical house. *Androne*s accommodating three, seven, or even eleven couches were common in domestic buildings (Fig. 4; Fig. 2, room d).

The *andron* was the room displaying the highest quality decoration; mosaic floors were first placed here and only later were used to pave other rooms of houses and public buildings (Westgate 1997–1998). The mosaics were primarily decorative with the designs aligned to be seen best by diners entering the *andron* (Fig. 5). The pavements were conceived of as carpets in stone and some rooms also had a small panel laid in the doorway to mimic a doormat. The stone floors had a practical aspect. Many dinner and drinking parties ended with spilled food and drink mixed with the remains of vessels that had slipped from the grasp of drunken guests and the stomach contents of those who had over-imbibed. Slaves charged with cleaning the *andron* could simply sluice out the mess without damaging a floor laid in stone. Some *androne*s were preceded by an anteroom, a buffer between the noise of the all-male party, and the privacy of the household residents, and many anterooms were furnished as nicely as the dining room itself, with mosaic pavements and painted walls. The quality of much of the décor was intended to declare the wealth and taste of the householder to his guests.

Economy

Status Display

Throughout Greek history, the householder had many ways to demonstrate his wealth. Some status displays were on the house façade and were intended for both the passerby and the invited guest. Storage jars were often prominently placed in early Greek houses on Crete and the Cycladic islands, declaring that the owner had the necessary resources to supply his dependents in times of need. Doorways and some windows were inserted into the exterior walls of Classical and Hellenistic houses and were further means for demonstrating wealth (Tsakirgis 2010). Because the regions that border the Mediterranean are extremely dry, wood was rare and extremely costly, so much so that evidence from inscriptions (e.g., sales contracts and leases for houses as well as auctions of property) often stipulated that the doors and shutters were movable property, rather than part of the real estate (e.g., IG I^3 422, ll. 13-6; IG I^3 l. 3, l. 6). The metal nails and bronze bosses attached to the doors made the wooden doors impregnable and even more impressive to a visitor. The street entrance to the Classical Greek house was rarely distinguished by any architectural embellishments, although some were favored in the Hellenistic period when pilasters were fashioned on either side of the main door, as in the House of the Official at Morgantina (Tsakirgis Forthcoming). The upper rooms in several Delian houses, such as the House of the Pediments, were provided with large windows, framed with impressive pilasters.

In the Late Classical and Hellenistic period when larger houses were built, the rooms were more commodious than their predecessors, but more specialized rooms were also constructed. As noted above, purpose-built kitchens first appear in fourth century houses. Personal cleansing, which was earlier accomplished with water poured into *lekanai* (basins) or *louters* (shallow basins on stands), took place instead in the bathrooms of elite houses. The bathrooms were often constructed next to rooms with hearths, either the kitchen, as at Eretria, or the hearth room, as at Olynthos (Reber 1998: 56–57; Cahill 2002: 250). The proximity of the two rooms allowed water to be heated before it was used by the bather. Bathing culture developed considerably in the Hellenistic period when heated domestic baths were built in Hellenistic houses, for example, the House of the Arched Cistern at Morgantina (Tsakirgis Forthcoming; Trümper 2010).

Early Greek houses lacked any permanent decoration; textiles used as curtains or rugs may have provided some interior embellishment. The second half of the fifth century BCE was a watershed for domestic décor as it was for house size. At this time mosaic pavements and painted wall plaster first appeared in domestic settings and both were intended to impress guests, as is evident from their placement first in the *andron* where men were entertained. As did the doors and fittings of the street entrance, the formal flooring and the painted plaster declared the wealth and taste of the householder to those outside of the family. The earliest domestic mosaics were created with black and white pebbles laid in designs including the geometric and floral forms known from vase painting, architecture, and probably also no longer extant textiles. Central scenes were largely mythological and Dionysos was favored in the *andron* where drinking was the preferred activity. In the third century BCE, the stones were cut into cubic *tesserae* so that they could be set more closely together and the palette was broadened to include as full a spectrum of colors as the available materials allowed (Dunbabin 1999: 18–37) (Fig. 5).

The painted wall plaster was quite simple in its arrangement in Classical houses, with one color used for the dado and another for the wall above. On the walls of Hellenistic houses, fictive architecture was produced in painted and sometimes molded stucco; rows of blocks with drafted edges were rendered in a variety of hues, often reflecting the wider array of colors used in the floor mosaics. Some blocks were painted with imitation veining to resemble expensive marble, the ultimate inspiration for all of the colorful display. Doorframes and cornices were created in stucco in imitation of the forms used in public architecture. Figural painting was very rare in the domestic setting until the late Hellenistic period, when it is found in some Delian houses. As houses became larger in the Hellenistic period, rooms that would be seen by guests were favored with expensive decoration, but increasingly more of the house was decorated in some way (Westgate 1997–1998).

The evidence for other forms of decoration in domestic contexts is scant, largely due to the vagaries of archaeological preservation. Greek houses possessed some sculpture, although most if not all must have been dedicated to household ritual; however, a secondary function of the images would have been their aesthetic effect. Sculptures in the houses at Eretria and Delos were displayed so that they could be seen from many parts of the home and especially by those entering the front door. Terracotta figurines are abundant in domestic assemblages and also functioned as both ritual equipment and decoration of the interior space. Written sources (IG I^3 423, ll. 59, 60–61, 62; Pritchett 1956: 250–253) attest that painted panels (*pinakes*) were displayed in some Classical houses, but none is preserved to give any information as to common subjects or settings for the pictures.

G

Socioeconomic Considerations

Distinguishing between elite and non-elite housing can be difficult in the absence of both prosopographic information and complete artifactual assemblages. A further complication results from anachronistic assumptions about elite residences. While it might be assumed that the wealthy or politically powerful lived in large and elaborately furnished homes, testimony from Demosthenes (*Olynthiac* 3.25) suggests that at least in the fifth century BCE men of power lived in houses indistinguishable from those of other Athenians. In cities such as Athens, with a large population of metics (resident aliens) in the Classical period, it is also difficult to distinguish between houses occupied by citizens and those lived in by the metics who could not own a property before the fourth century BCE and thus rented living space from a citizen landlord (Thür 1989).

The homes of the poor are especially challenging to identify. Literacy among this group was virtually nonexistent, so there are no firsthand accounts of their houses. Some two- or three-room residences, identified as such from the domestic wares recovered there, have been recognized in a block of Classical houses on the slope of the Areopagus in Athens (Fig. 3). A few of the original housing lots at Olynthos were later divided into smaller units, perhaps for families of lesser means. Some Delian houses of the Hellenistic period, for example, the House of the Masks, had

staircases located in the street, suggesting that the upper story was independent of the house below and may have been a rented or separately owned apartment (Trümper 2005: 136).

Commercial Activity and Houses

In many Greek cities the divide between residential areas and those dedicated to industry and commerce was not as pronounced as it is in modern urban areas. In some Athenian houses living and workspace was little distinguished, and both tools and worked materials suggest that industrial activity was conducted in the same building where whole families resided (Tsakirgis 2005). Spacious houses allowed for the segregation of industrial activity from the domestic, the assemblages indicating that household activities were relegated to one part of the building and the manufacturing and sales to another. Several such houses stand on the periphery of the Athenian Agora (Fig. 1) and because of their location take advantage of the commercial activities that were one focus of the civic center.

Some Greek houses have single rooms or two-room suites which open directly onto the street and do not communicate with the living quarters within (Fig. 1, rm. 12). While these rooms were likely shops, many do not contain evidence of what was manufactured or sold within. Such shops lined major thoroughfares or clustered at the intersections. The shopkeepers of antiquity were well aware of the advantage of location for attracting passersby to purchase their wares.

Regional Variation

There is evidence of regional variation in Greek houses. Some differences can be ascribed to the availability of materials, such as wood or expensive stone, for example, although wood was scarce in mainland Greece, it was more abundant in Sicily, and so wooden doors were more commonly built in the island houses and woven curtains probably used to close off rooms in mainland houses. In mainland and eastern Greece where marble was abundant, household sculpture or *tesserae* in the mosaic floors could be crafted from the more expensive stone.

Other differences were due to climatic variation in the areas where Greeks lived. Most of the islands, for example, were especially dry, and the flat roofs of Cycladic houses can be seen as responses to this climatic condition. The rainfall there was so negligible that the pitched roofs with costly terracotta tiles common on the mainland were not constructed on island houses. Some northern sites (e.g., Olynthos and Stageira) were subject to cold and windy weather in winter, so fixed hearths continued to be built there throughout the Classical period, even though elsewhere the portable brazier served for heating and cooking.

Significant regional differences in the plans of houses result from variations in social practice. While the Greeks can be recognized in general terms as a cultural group, their social organization, whether familial or political, was based on varied practices throughout the Mediterranean. As the layout of houses has been deemed to be a direct response to the organization of social life, we can observe the social variations in the plan of the city in macrocosm and the house in microcosm. Thus, while the single-entrance courtyard house prevailed in democratic cities, communities with different social practice built their houses to a different model. Houses on Crete, for example, continued to have direct access from the exterior and a linear layout of rooms in later periods, indicating that the social norms and practices there differed from those in cities such as Athens (Westgate 2007).

Greek Islands (Excluding Crete), Archaeology of

Vangelis Samaras
History and Archaeology, University of Athens, Athens, Greece

Introduction

The Aegean Sea is full of islands ranging in size from a few large ones to numerous islets and uninhabited rocks. It is easy to discern a series of distinct clusters: the Northern and Eastern Aegean islands, the Northern Sporades, the Argo-Saronic Gulf islands, the Cyclades, and the Dodecanese.

Another cluster is formed by the islands in the Ionian Sea. Although the Greek islands differ in size, landscapes, or resource wealth, they share many common features, which have consequently shaped their more or less common history. In addition to the numerical dominance of smaller islands over large ones, just a handful of islands can be characterized as rather isolated (e.g., Lemnos, Skyros, and Astypalaia) since interisland distances are modest and the majority of the islands are a short distance from mainland shores. This feature entails, in optimal weather conditions, the high degree of intervisibility in the island-studded seas of Greece. Thus, the islands became enmeshed in interaction networks and, thanks to their key role in communication routes, occupied diachronically a particularly favorable position in these networks. The dialectical relationship with non-insular communities significantly influenced the Greek islands from their early history. The insularity, however, enabled islands to assimilate selectively continental elements and develop their own cultural diversity. Nevertheless, the escalating incorporation by the great powers of each historical period led to the gradual loss of the islands' cultural identity. Explicitly, the flourishing islands of the Early Iron Age (EIA) and the Archaic period gradually lost their autonomy and were controlled by the emergent *poleis* (city-states) of mainland Greece and the Hellenistic kingdoms, until they were reduced to a minor part of the Roman provinces.

Definition

Archaeology of the Greek islands may be defined as the study of every element of their material culture, in order to provide an expanded understanding of island history. The available archaeological information results from the numerous systematic or rescue excavations and field surveys that have been undertaken in the Greek islands since the end of nineteenth century by many organizations: the Greek Archaeological Service, the Archaeological Society of Athens, and other Greek institutions (such as universities and institutes), as well as several foreign archaeological schools (e.g., the British, the French, and the Italian) and institutes (including the German, the Austrian, the Swedish, the Danish, the Norwegian, the Irish, the Netherland, the Australian, and the Canadian).

Historical Background

The time span from the end of the Bronze Age to Byzantine times is conventionally divided into five periods: the Early Iron Age (c. 1050–700 BCE), the Archaic (c. 700–479 BCE), the Classical (c. 479–323 BCE), the Hellenistic (c. 323–31 BCE), and the Roman period (c. 31–324 CE).

The collapse of Mycenaean palatial centers in the late thirteenth century BCE and the consequent gradual disintegration of the Mycenaean civilization during the twelfth and early eleventh centuries BCE marked the beginning of a long period of social upheaval and political ferment that significantly affected the Greek islands (Dickinson 2006). In the early 1970s, the term "Dark Ages" was adopted for the period c. 1050–900 BCE in order to denote its culture, which seemed to be in a state of decline and isolation, as well as the low level of our knowledge of this period (Lemos 2002: 1). Recent archaeological research, however, is gradually changing this picture, particularly regarding the alleged poverty and isolation. An alternative term for the period c. 1050–900 BCE is "Protogeometric," after its characteristic pottery style (Lemos 2002: 27–100).

The ensuing Geometric period (c. 900–700 BCE), named after its main style of pottery, was a time of dramatic transformation that led to the establishment of primary Greek institutions (Coldstream 2003). The small Protogeometric settlements developed into well-organized towns, population increased, overseas contacts were intensified, trade was expanded, and iron metallurgy developed significantly. Moreover, the Greeks adopted the Phoenician alphabet during the first half of the eighth century BCE. It is not possible to determine the birthplace of the Greek alphabet, but there is no doubt that Euboea and the Aegean islands played a pivotal role (Mazarakis

Ainian and Leventi 2009: 214–215). All these advances were interdependent and resulted in the general improvement of living conditions. The major rise in population, however, created a land hunger, which eventually led to the foundation of colonies overseas, and wars in the homeland (Coldstream 2003: 368). Moreover, maritime trade rivalries aroused the hostility between certain islands, and archaeological research may reveal some events related to these conflicts (e.g., the two massed graves at Paroikia on Paros; Coldstream 2003: 398–399; Mazarakis Ainian and Leventi 2009: 215).

The Archaic period (c. 700–479 BCE) was the heyday of the islands. They enjoyed great prosperity, thanks to the exploitation of raw materials (e.g., marble quarries of Naxos and Paros, gold and silver mines of Siphnos), their strategic position for control of sea routes, and their political autonomy. Many flourishing islands, such as Naxos, Paros, Andros, Thera, Samos, Chios, Thasos, and Rhodes, took a leading role in the colonization of Sicily, Southern Italy, Thrace, the Black Sea, the west coast of Asia Minor, and the north coast of Africa, while several offshore islands (e.g., Thasos, Lesbos, and Rhodes) controlled extensive lands on the mainland opposite (Constantakopoulou 2007: 231–253). On the other hand, trade rivalries led to clashes between island and mainland cities (e.g., Mytilene-Athens and Samos-Megara) or between islands (e.g., Naxos-Paros and Samos-Aegina). Meanwhile, political ferments and social upheavals took place in the island *poleis*, as a result of the economic success of more middling citizens (e.g., seafarers and merchants) or the disaffection of excluded aristocrats. This allowed the emergence of tyrannical regimes in a few islands, such as Naxos (Lygdamis) and Samos (Polycrates). In order to maintain and stabilize their own positions of power, the tyrants embarked on major building projects, whose distinguishing feature is monumentality. Herodotus (3.60) considers the Samian buildings as the greatest of all Greece and admires particularly the temple of Hera, the aqueduct, and the great harbor mole, ordered by Polycrates (Rolley 1994: 157).

From the Persian wars onward (the Classical period, c. 479–323 BCE), the islands lost their political independence and stayed in the shadow of the great powers of each historical period. At the beginning of the fifth century BCE, most of the islands were under Persian rule. After the Greek success against the Persian Empire, the islands fell under the direct control of Athens, first in the "Delian (or "First Athenian") League" and then in the "Second Athenian League," interrupted only by an interval under Spartan domination (c. 404–378 BCE). After the victory of Phillip II over the combined Greek forces at Chaeronea (338 BCE), the islands became subject states of the Macedonian kingdom. Nevertheless, thanks to their strategic position and the exploitation of their natural resources (e.g., marble from Paros and Thasos; wine from Thasos, Chios, and Kos; ruddle from Kea; mastic from Chios), several islands achieved economic prosperity which is clearly manifested in their material culture (see below).

During the early Hellenistic period (late fourth–early third centuries BCE), the rivalries between the rulers of the successor kingdoms involved the Greek islands, as the Antigonids and the Ptolemies were trying hard to assume the leadership of the "League of Islanders." Rhodes was the only island able to maintain her political independence and developed into a naval power until Delos was declared a free port (167/6 BCE), delivering a severe blow to the Rhodian economy and promoting the explosive growth of Delos during the second half of the second century BCE (Bruneau and Ducat 2005: 41). Meanwhile, trade and, to a lesser extent, religious festivals (for instance, in honor of Hera on Samos, Asklepios on Kos, and the Kabeiroi on Samothrace) gave island communities a cosmopolitan character, reflected in the temples which served non-Greek deities on Delos, as well as in the Jewish synagogues on the islands of Samos, Delos, Kos, and Rhodes. Throughout the Hellenistic period, piracy was a constant threat to the islanders but at the same time yielded substantial profits for several islands, such as Delos, Rhodes, and Aegina, where there were thriving slave markets (de Souza 1999: 43–96). Moreover, the islands

suffered many hardships as a result of the Mithridatic wars and Rome's civil strife during the first century BCE, as, for example, Delos, which was sacked twice (88 and 69 BCE) and never fully recovered (Bruneau and Ducat 2005: 42–43).

Rome first established trade contacts with the Greek world in the sixth century BCE, while her political and military involvement started with the 1st Illyrian war (229–228 BCE) and grew steadily, resulting in the complete submission of Greece (Alcock 1993: 8–24). It was not until the battle of Actium (31 BC), however, that Greece was finally reconciled to Roman rule in a unified empire. The islands were included in the Roman provinces of Achaea, Macedonia, Epirus, and Asia, until the end of the third century CE when a separate island province (*Insulae*) was formed including most of the Aegean islands. Trade routes were extended throughout the Mediterranean due to the vast size of the Roman Empire. As a result, the islands lost the key role they had played over the preceding centuries. A clear indication of their marginal importance is illustrated by the fact that many islands (e.g., Amorgos, Donousa, and Gyaros) served as places of exile. Nevertheless, *negotiators* or *pragmateuomenoi* (businessmen; Alcock 1993: 75–77, 101) settled in many islands (e.g., Kerkyra, Zakynthos, Tenos, Delos, Naxos, Melos, and Thera), and, as archaeological evidence indicates, several island communities or certain islanders enjoyed economic prosperity.

Key Issues/Current Debates

Archaeological research of the Greek islands is very important, as it can inform us about the history of islands themselves, as well as about the history of the Greek world and, more generally, of the Mediterranean. There are notable idiosyncrasies related to island culture as islanders can be temporarily linked in or cut off from the Aegean/Mediterranean as networks shift. Thus, one of the greatest challenges for scholars is to explore the indigenous island elements and how they factored into the formation of island culture. Another challenge is to understand which aspects of island culture resulted from the influence of other regions, as well as in what way the islands affected the non-island world. Thanks to fieldwork and study conducted by several generations of Greek and non-Greek archaeologists, our knowledge about the archaeology of the Greek islands has increased significantly. There is certainly a lot that remains unknown or which requires further examination, but the current state of archaeological knowledge about the Greek islands provides enough material for a satisfactory understanding of what living on islands might have been like.

Settlement and Settlements

The limited data available about the Protogeometric settlements do not permit safe conclusions about their layout. However, it can be stated that in most islands, habitation was scattered in villages, hamlets, and isolated farmsteads (Dickinson 2006: 84–93). Dramatic changes during the Geometric period resulted in the gradual development of well-organized towns toward the end of the eighth century BCE. Most of these towns (e.g., Zagora and Hypsele on Andros, Emborio on Chios) were founded on rather inaccessible and naturally defensible positions, indicating a feeling of insecurity (perhaps because of piratical raids), and were usually densely built but with no precise plan (Coldstream 2003: 305–311, 399). The houses were rectangular and stone built, while flat roofs must have been the general rule (Mazarakis Ainian and Leventi 2009: 216–218).

During the Archaic period, some of the EIA settlements grew into *poleis* (e.g., Naxos, Xobourgo on Tenos, and Minoa on Amorgos), while others did not (e.g., Ayios Andreas on Siphnos, Hypsele on Andros). Island *poleis* also were created by the unification of communities which peacefully abandoned their previous settlements to found a new city. For example, Palaiopolis on Andros probably received an influx of population from Zagora and Hypsele, and on Paros, the inhabitants of Koukounaries apparently moved to Paroikia (Mazarakis Ainian and Leventi 2009: 219). It is noteworthy that several large islands, such as Andros, Tenos, Naxos, and Paros, had only one single *polis*, while smaller

and less prosperous islands (e.g., Kea, Mykonos, and Amorgos) had more than one *polis* from the Archaic period onward. There is no universal explanation for this phenomenon, as it seems that each case was affected by local factors. For instance, the division of Kea into four territories reflects either different periods of settling or intervention by neighboring and powerful Athens (Cherry et al. 1991: 5, 8).

During the Classical, Hellenistic, and Roman periods, the *poleis* of Archaic times continued to be inhabited, but the available information is rather restricted since most of these cities lie under the modern towns. Regarding settlement patterns of the islands, archaeological research indicates a three-tier hierarchy: towns, villages and/or hamlets, and farmsteads. The Archaic and Classical houses were simple structures and served the needs of a family. However, from late Classical times and during the Hellenistic period, houses became a medium for the rich and powerful to demonstrate their wealth and social status. As a result, luxurious edifices of two or even three stories, with peristyle courts, elaborate banquet halls (*androne*s), sumptuously decorated rooms, and a large number of service rooms, were constructed (Winter 2006: 157–182).

During the Roman period, the island cities gradually acquired a pronounced Roman flavor, but they retained their Greek character (see below). Both in the cities and in the countryside of islands like Lesbos, Samos, Kos, Naxos, Melos, Kerkyra, and Kephallenia, luxurious buildings (usually referred to as "villas," Alcock 1993: 64–68) decorated with mosaic pavements, wall paintings, and statuary were constructed. These buildings, the most distinguished of which are the so-called Menandros's House on Lesbos and the Casa Romana on Kos, usually served as residences of wealthy families or were intended for certain public services, such as the "Hall of the Mystae" in the city of Melos, a religious meeting place for worshipping Dionysos (Karvonis and Mikedaki 2012: 38, 92–93, 174, respectively).

Public and Religious Architecture

Strong fortification walls reinforced the natural defensibility of many EIA settlements, including Zagora and Hypsele on Andros, Xobourgo on Tenos, Vathy Limenari on Donousa, Minoa on Amorgos, and Emborio on Chios. The construction of fortifications was a corporate enterprise, indicating a remarkable degree of political cohesion among the people who dwelt inside them, as well as of political organization of island communities. Moreover, in some of the better-preserved island settlements (Emborio on Chios and Zagora on Andros), an open space between the sanctuary and the chief residence has been interpreted as a space for assembly, where the elite group was entitled to take the decisions on the public life (Coldstream 2003: 314–315).

Due to the lack of architectural evidence with undisputed religious purposes, it is assumed that almost all worship took place in the open air during the Protogeometric period. The focal point of the cultic activity was usually an altar or a large rectangular hearth (*eschara*). During the Geometric period, these open-air sanctuaries gradually evolved into temples, and worship habits were standardized. In addition to the urban temples (e.g., at Emborio on Chios, Zagora on Andros, and Koukounaries on Paros), there were sanctuaries and temples located outside the settlements. These are divided into "rural" and "peri-urban," such as at Ayia Irini on Kea and Iria on Naxos. The Heraion of Samos is a characteristic case of an open-air sanctuary which subsequently evolved into a major "peri-urban" temple.

During the Archaic period, the prosperity of the islands and intense competition between citizens, tyrants, and *poleis* for wealth, power, and prestige is evidenced by the public and religious architecture. Until the end of sixth century BCE, many island *poleis* had constructed impressive fortifications (e.g., Thasos, Samos, Aegina, Karthaia on Kea; Xobourgo on Tenos; Vryokastro on Kythnos; Kastro on Siphnos; Paroikia on Paros; Minoa on Amorgos; Melos) and aqueducts, such as the famous aqueduct by the architect Eupalinos for the city of Samos and the aqueduct of Naxos. Moreover, public buildings with different functions appeared mainly in major sanctuaries, such as Delos (e.g., "Oikos of the Naxians," "Treasury 5," "Bouleuterion" or

"Building D," "Stoa of the Naxians," "Oikos of Andros"; Bruneau and Ducat 2005: 171–176, 188, 189, 199–200, 205, respectively) and the Samian Heraion ("South Stoa"; Gruben 1966: 319–320). Display of wealth is also observed in impressive architectural offerings, such as the treasury of the Siphnians dedicated at Delphi and the Naxian dedications at Delos (Gruben 1966: 81–82, 144; Bruneau and Ducat 2005: 199–200).

Several of the most prosperous islands contributed significantly to the process that led to the canonical form of the monumental Greek temple (Gruben 1966: 32–42, 309–315). At Samos, three successive temples dedicated to Hera were built during the Archaic period: the "Hekatompedon II" (c. 675–625 BCE), the "Rhoikos temple" (the first monumental Ionic temple, c. 570–560 BCE), and the "Great Temple" (erected by Polycrates before the end of sixth century BCE; Gruben 1966: 318–319, 321–325, 325–329, respectively). Naxos undoubtedly played a leading role in the shaping and development of the Ionic order, as evidenced by the temple of Yria, the unfinished temple of Apollo Delios in the city of Naxos, the temple of Gyroulas (Mazarakis Ainian and Leventi 2009: 220–222), and the Oikos of the Naxians on Delos (Gruben 1966: 144; Bruneau and Ducat 2005: 199–200). Paros rivalled Naxos with the temple of Athena at Koukounaries, the temple of Artemis on the Delion, and the Apollo sanctuary on the islet of Despotiko near Antiparos (Mazarakis Ainian and Leventi 2009: 219, 222–223). Lesbos contributed to the formation of the so-called "Aeolic" (or "Proto-Ionic") order, whose main feature was the Aeolic column capital (Betancourt 1977: 87). The Doric order was formed in mainland Greece, yet important Doric temples are found on several Greek islands, as, for instance, the two successive temples of Athena Aphaia on Aegina (Gruben 1966: 110–115) and the temple of Artemis on Kerkyra (Gruben 1966: 103–107).

During the Classical period, the majority of cities had massive fortifications, which were both a military advantage and a vivid symbol of the sovereignty of the *polis*. Some of them (e.g., Thasos in 463 BCE, Aegina in 457 BCE, Samos in 439 BCE, and Mytilene in 427 BCE; Hansen and Nielsen 2004: 779, 622, 1095–1097, and 1027, respectively) were compelled to demolish their walls for political reasons. Numerous temples, political structures (e.g., *prytaneion* and *bouleuterion* on Delos and Paros), and other public buildings (e.g., stoas on Delos, Andros, Thera, Kos, and Thasos) are attested archaeologically. Moreover, theaters (e.g., Delos, Methymna on Lesbos, Ialysos and Lindos on Rhodes) and stadia (e.g., Aegina, Rhodes) started to be constructed in the islands probably before the end of the Classical period (Hansen and Nielsen 2004: 1379–1381).

Freestanding towers, round or square in shape, are one of the most common features of the islands in the late Classical and Hellenistic periods (Morris and Papadopoulos 2005). Particularly numerous on some islands (33 on Thasos, over 70 on Kea, 76 on Siphnos), they have been detected on the Cyclades (Andros, Tenos, Naxos, Kythnos, Seriphos, Ios, Amorgos), the Northern Sporades (Skopelos, Alonnesos), the northeastern Aegean (Lesbos), and the Ionian islands (Leukada), as well as on tiny islands (e.g., Seriphopoula, Herakleia, Arkioi, and Pharmakonisi). Various interpretations have been proposed, such as that they served as agricultural storehouses, slave quarters, lookout, and signaling posts and that they protected mines and quarries and/or were used as places of temporary refuge in cases of emergency; their precise function, however, remains disputed.

The most characteristic feature of the Hellenistic architecture is the theatrical mentality, which is expressed mainly in planning and organization of sanctuaries (Pollitt 1986: 230–242). Stoas, stairways, ramps, colonnades, and gates were used in a calculated, coordinated way in order to slowly lead potential visitors to a dramatic climax before the temple was revealed. Perhaps the most impressive of such arrangements are the temple of Athena at Lindos on Rhodes and the sanctuary of Asklepios on Kos (Winter 2006: 216–218). It is worth mentioning that the initiative in the architectural formation of the great sanctuaries (e.g., on Samothrace, Kos, and Rhodes) was being seized by rulers (such as Ptolemy II Philadelphus,

Arsinoe II, and Eumenes II), who flaunted their power, wealth, and hegemonic ambitions.

In Roman times, the temples, public buildings, and urban infrastructure resulted from the beneficence of local patrons and, sometimes, the emperor himself, who donated the construction costs and materials or underwrote repairs. The traditional forms of urban architecture could easily absorb Roman structures. As a result, certain typical building structures, such as fora and basilicas, did not exist in most island cities. Arenas, the main feature of Roman public leisure, are also not found on the islands, since preexisting theaters and stadia could be adapted, as is the case of the theater on Thasos. Odea (music halls) were built on several islands (e.g., Ikaria, Kos, Rhodes; Karvonis and Mikedaki 2012: 58, 94, 124) in order to host music competitions, oratorical speeches, and philosophical lectures. Despite their strong Greek character, however, the islands adopted numerous typical Roman features, such as temples constructed on podiums, paved streets (e.g., Samos, Kos; Karvonis and Mikedaki 2012: 68–69, 94), drains (e.g., Samos; Karvonis and Mikedaki 2012: 69–70), aqueducts (e.g., Lesbos, Samos, Melos; Karvonis and Mikedaki 2012: 32–33, 65–66, 174), and cisterns (e.g., Karpathos, Amorgos; Karvonis and Mikedaki 2012: 81, 143). Moreover, bathhouses have been found on many islands, such as Lesbos, Ikaria, Kalymnos, Kos, Nisyros, Telendos, Amorgos, and Skiathos (Karvonis and Mikedaki 2012: 27, 59, 79–80. 95–97, 105–106, 136, 141, 242), proving that the islanders had adopted the habit of public bathing, a salient characteristic of Roman daily life. The scale and the quality of the baths varied enormously, from small, less sumptuous structures to large, luxurious facilities.

Burial Customs

Graves and grave goods provide the greater part of the available archaeological data for the Protogeometric period in the islands. The presence of numerous small, separate, and close clusters of graves (e.g., at Naxos or Skyros) indicates a dispersed settlement pattern on most of the islands, on the assumption that each cemetery was attached to a settled area. Although the universal rite was inhumation in cist tombs and in vessels, some cremated burials have been dated to the same period (Dickinson 2006: 183–195). Offerings from the graves consisted of pottery, dress ornaments, jewelry, and weapons.

During the Geometric period, the dominant practice was inhumation in cist or pit graves (e.g., at Tenos and Kos) and urn cremation (e.g., at Lemnos, Naxos, Paros, Kimolos, Thera, and Rhodes). Grave goods (mainly pottery, jewelry, and weapons) reflect the growth of prosperity in the period. Also worth mentioning are the cemeteries at Tsikalario in central Naxos and at Kylindra on Astypalaia, as they are unique in the islands. At Tsikalario, a cemetery of tumuli that contained varying numbers of cremation *pyres* was used during the Middle Geometric period (c. 850–750 BCE). In the recently excavated Kylindra's cemetery on Astypalaia, over 2000 children younger than 3 years old were buried in pots from the second half of the eighth century BCE through Roman times. Finally, during this period, a new form of cult developed in the Greek world; the veneration of heroic forebears first appeared during the ninth century BCE and became firmly established at the end of the eighth century BCE. Excavations at the Metropolis square site on Naxos revealed that rituals in honor of the dead gradually took the form of an abstract ancestor cult (ninth and eighth centuries BCE) and finally evolved into hero worship (second half of the eighth century BCE). Other examples of this new form of cult come from several islands, such as Amorgos and Paros (Dickinson 2006: 191, 234; Mazarakis Ainian and Leventi 2009: 219, 237 n. 29).

In the seventh century BCE, diversity of burial customs continued, since the dominant practice in some islands was inhumation, while in others was cremation. During the sixth century BCE, however, inhumation became the more popular method of burial, although still not exclusively, and only Thera retained a preference for cremation burials (Kurtz and Boardman 1971: 177–179). In Aegina, an important series of chamber tombs began to appear in the early sixth century BCE. A remarkable innovation of the Archaic burial customs was the use of the plain

or decorated stone *sarcophagus*, which was used from the seventh century BCE in many islands, including Rhodes, Samos, Chios, and Aegina. The decorated clay sarcophagi, which were used in Kameiros on Rhodes, Samos, Chios, and Lesbos, date mainly to the sixth and early fifth century BCE. Moreover, many island cemeteries have yielded a fair number of grave markers and monuments, such as *stelai*, relief and decorated gravestones, and statuary (mainly *kouroi* and *korai*). Finally, worth mentioning is the grave of Menekrates on Kerkyra, an impressive circular cenotaph of c. 600 BCE (Kurtz and Boardman 1971: 245, 375).

During the Classical period, there was a marked decrease in funerary monumentality and offerings. In general, chamber tombs went out of fashion, and graves had the form of shafts or pits cut into the ground, slab-lined pits, and *sarcophagi*. In several islands, however, there are groups of elaborately constructed chamber tombs (e.g., Rhodes, Aegina). For adults, inhumation was the usual method of burial, and cremation was still practiced to any marked extent only in Thera, although it did not completely disappear from the islands. Children were buried in pots, clay tubs, and small *sarcophagi* (Kurtz and Boardman 1971: 193, 195–196).

In the Hellenistic period, burial customs did not change considerably from the preceding centuries, but in many cases, there is a marked tendency toward monumentality and theatricality, adopting the characteristic cultural attitudes of the period. In Rhodes, for example, there are impressive rock-cut tombs, several vaulted chambers, and a small stone tumulus. In Kos, Charmylos was honored by a two-story building constructed over a vaulted crypt (c. 300 BCE), and on the second-century BCE Paros, there were *sarcophagi* raised on rectangular bases (Kurtz and Boardman 1971: 281, 286, 300, 373–374).

Finally, in Roman times, there was a great range of grave types, including rock-cut tombs and carved stone (usually marble) *sarcophagi*. The grave goods included pottery, terracotta figurines, lamps, jewelry, and coins. Worth mentioning also is the rock-cut necropolis of the city of Melos (the so-called catacombs) with the several thousand burials of third and fourth centuries CE (although a few were earlier), virtually unique in Greece (Karvonis and Mikedaki 2012: 175).

Pottery

Protogeometric pottery offers valuable evidence for island communities, as well as for their external contacts (Lemos 2002). Besides imports, local productions afford evidence for close contacts with the mainland world, and especially with Attica and Euboea. During the Geometric period, many non-insular regions (mainly Euboea, Attica, Corinth, and Anatolia) continued to exercise considerable influence on islands' pottery production (Boardman 1998: 23–55). Nevertheless, several islands (e.g., Naxos, Paros, Melos, Thera, and Rhodes) established their own workshops, which contributed greatly to the development of the Greek Geometric pottery.

From the end of the eighth century BCE, there were several local workshops which incorporated models and ideas from the east into their Geometric tradition (sc. "Orientalizing phase" in Boardman 1998: 83–85, 110–112, 141–147). Gradually, however, these workshops developed their own Archaic styles, which were under the greater influence of Athenian and Corinthian black figure pottery (Boardman 1998: 177–178, 216).

Throughout the Classical period, island pottery production was under the artistic domination of Athens. Besides Atticizing imitations, ceramic production of the island workshops was almost limited to the production of transport *amphorae*. The Thasian, Chian, Lesbian, Samothracian, Samian, Rhodian, and Koan wine was famous, and their *amphorae* are found in large quantities throughout the Mediterranean world, as their wine was famous (Whitbread 1995: 41–44).

Production of painted vases in the islands declined in the Hellenistic period, due to the general replacement of fine pottery by metal vessels. Particularly popular, however, was the relief ware, which imitated luxurious metal tableware. The relief bowls (the so-called Megarian, as it was formerly believed that the sole center of production was Megara) are black- or red-glazed

hemispherical cups with decoration covering the entire exterior of the vase (except for the rim) and ranging from abstract and floral ornaments to animal and human figures (Henig 1983: 182; Pollitt 1986: 256). Rhodes has yielded a fair amount of distinct black-figured pottery reserved for funeral use, which has been named "Hadra" style after the homonymous cemetery near Alexandria, where the first examples were discovered (Politt 1986: 256–257). Again, several islands produced transport *amphorae* for liquid products, like wine and olive oil. The shape of a typical transport *amphora* with a pointed or rounded toe was unsuitable for storage but ideal for transportation in the hull of a ship, where the vessel could be tightly packed (Whitbread 1995: 19–24, 34–37). Finally, in Roman times, the local pottery production was restricted to domestic and commercial needs, while imports from Rome and other major centers were increased (Henig 1983: 186–187).

The Plastic Arts

Throughout the EIA, the range of plastic works was restricted to figurines in terracotta, bronze, wood, and, extremely rare, ivory. The figurines, usually male and female, were used almost exclusively as sanctuary dedications (especially at major sanctuaries, such as Delos and the Samian Heraion), but their number increased gradually during the course of the eighth century BCE.

In the early Archaic period, elaborately decorated female statuettes in terracotta were dedicated at sanctuaries (e.g., Samos, Despotiko, and Kastro on Siphnos). Plastic works in terracotta, bronze, wood, and ivory continued to be produced, but, from this time on, stone became the basic material; one of the earliest works of monumental sculpture was the female statue dedicated by the Naxian Nikandre at Delos (Rolley 1994: 145–146; Bruneau and Ducat 2005: 86).

From the later seventh century BCE onward, monumental sculpture underwent a considerable improvement, and the islands played an important role in the development of the two basic sculptural types: the *kouros* and the *kore* (Rolley 1994: 165–174, 176–187). The *kouroi*, young men appearing as "heroic nudes," were votives at sanctuaries or used as funeral monuments. Initially, the *kouroi* had supernatural size, such as the "Colossus of the Naxians" on Delos, a few *kouroi* from Samos and from the Archaic cemetery of Thera, and the so-called kriophoros ("man carrying a ram") from Thasos (Rolley 1994: 146; Bruneau and Ducat 2005: 177–181). Gradually, however, they became more realistic: for instance, the so-called Strangford Apollo (Anaphe is the reputed provenance, now in the British Museum) and the *kouros* from Kea (Rolley 1994: 272). Several early *korai*, seated or standing clothed women, were also represented as larger than life size (e.g., the fragment of a 2.5 m. tall *kore* from Samos), while later artistic focus shifted to a concern for a detailed rendering of their elaborate dresses. The *korai* were widely set up as dedications to female deities (e.g., to Artemis on Delos, to Hera and Nymphs on Samos), though funerary *korai* may have been extant on Samos, Chios, and Thera. Dedicatory inscriptions and signatures of their sculptors are quite often found on both types. Several island workshops, with their own stylistic characteristics, have been identified; most famous were the Naxian and Parian workshops which received commissions from other islands and mainland Greece. Finally, the architectural sculpture was restricted to sacred buildings, such as the temple of Artemis on Kerkyra, the treasury of the Siphnians at Delphi, and the Samian Heraion (Rolley 1994: 183, 190, 221, 269–270).

The Archaic tradition continued into the first half of the fifth century BCE, when several schools (e.g., Naxian, Thasian, Samian, and East Ionian) functioned in the islands. Paros, especially with the reliefs in the so-called Severe style (c. 480–450 BCE), was the leading center for early Classical sculpture (Rolley 1994: 359–362). Parian works, in addition to those found on the island itself, have been found on the Aegean islands (mainly Thasos) and mainland Greece. In the second half of the fifth century BCE, the sculptural style of Classical Athens proved to be so influential that the local workshops gradually lost their unique styles. A fine example of this process is seen on the *stele* of Krito and Timarista from Rhodes (c. 410 BCE, Archaeological Museum of Rhodes), which combines the Parian tradition with the achievements of Attic

sculpture (Rolley 1999: 185). During the fourth century BCE, works of Attic origin or inspiration appear on most islands (mainly grave *stelae* in relief or with *anthemion*; Rolley 1999: 220).

The Hellenistic sculpture covered a wide range of types, such as freestanding statues of eminent men and distinguished women, equestrian statues of rulers, narrative groups, and athlete or hero figures. The typical feature of these works is a theatrical manner of representation, which emphasizes emotional intensity and a dramatic crisis. This theatrical temperament is obvious in the famous "Winged Nike of Samothrace," one of the masterpieces of Hellenistic sculpture (Ridgway 2000: 150–157). The goddess is shown in the form of a winged woman standing on the prow of a ship, braced against the strong wind blowing through her garments. This colossal work was placed in a pool filled with water in which the ship appeared to float. It has been suggested that this monument was dedicated to the sanctuary of the great gods by the Rhodians in commemoration of a specific naval victory in the early second century BCE. Naturally, sculpture flourished on prosperous islands, such as Rhodes, Kos, and Delos. During the Hellenistic period, Rhodes became a great center of sculpture in the Aegean, and some of the most important Hellenistic sculptures, for instance, the Aphrodite and the Poseidon of Melos, have been attributed to Rhodian sculptors (Ridgway 2000: 167–171). Kos has also yielded a rich collection of statues in a distinct style (Ridgway 2000: 164). The most renowned sculptors of the period worked on Delos, and a few workshops were established on the island, even though they cannot be considered as a "school" in the sense of a unified style (Bruneau and Ducat 2005: 101–111).

Finally, during the Roman period, all the public places of the cities were adorned with honorific statuary of prominent citizens, local benefactors, governors, and emperors. Although sculpture did not flourish as formerly, a large number of plastic works have come to light: copies of great Classical or Hellenistic originals (such as the well-known "Hermes of Andros"), portraits, funeral or votive steles, sarcophagi, and altars (Henig 1983: 66–96).

Mosaics

The first mosaics, made of natural pebbles, appeared in the Greek world c. 400 BCE, but it was only during the Hellenistic period that the technique of mosaic making underwent a striking development and remarkable innovations as a result of the prosperity of individuals and the desire to demonstrate their wealth (Pollitt 1986: 210–229). The house was a tangible symbol of the owner's status and helped to establish and enhance his position in the social order. Decorated pebble mosaics were produced in Greece probably from the late fifth century BCE and continued into the Hellenistic period. However, from the late third century BCE onward, regular cubes (*tesserae*) of stone, glass, and terracotta replaced pebbles as the principal material for mosaics. Mosaics of very high quality were made in a technique known as *opus vermiculatum*, in which extremely tiny *tesserae* were used (Pollitt 1986: 212). Some of the finest Hellenistic mosaics are found on Delos, where the great majority was produced between 166 and 100 BCE (Pollitt 1986: 215–218; Bruneau and Decat 2005: 125–130). Geometric designs are the most common, including bands of guilloche, complex meanders, groups of lozenges, or bead and reel; also popular are pictorial themes derived from the world of the sea (e.g., dolphins, tritons, and anchors) or the theater (e.g., masks). During the Roman period, mosaic art continued to flourish using geometric or abstract patterns and depicting mythological scenes. Masterpieces of Roman mosaics are found at "Menandros's House" on Lesbos and at "Casa Romana" on Kos (Karvonis and Mikedaki 2012: 38, 92–93).

Numismatics

The first Greek coins seem to be struck on Aegina around the middle of the sixth century BCE, and until the end of that century, many island *poleis* (e.g., Kerkyra, Siphnos, Naxos, Paros, Thasos, Lesbos, Chios, Samos, and Rhodes) minted their own coinage –evidence of their prosperity in Archaic times. During the Classical period, the majority of the islands issued their own coins, although Athens suppressed the civic coinage of

several islands for a substantial part of the fifth century BCE (Hansen and Nielsen 2004: 144–149, 1382–1389). The coins were normally minted in silver or bronze, although some gold (Thasos) or electrum (Lesbos) issues were also produced. In most cases, they carry legends referring to *polis*-ethnics, regional ethnics, or place-names, as well as pictorial and other devices (e.g., the principal deity of each island, subsidiary or local divinities, heroes, animal, and plants). Coinage was an essential feature of Greek economies, and the different standards and issues did not prevent commerce. Nevertheless, the domestic coinage of many islands, including Lemnos, Tenos, Syros, Amorgos, and the Northern Sporades, enjoyed circulation only at a local level. Finally, numismatics reveals the loss of the islands' autonomy during the Hellenistic and Roman periods. In the Hellenistic period, there were few civic issues of independent types, as civic coin types were replaced by the mass-produced coinage of the successor kingdoms (Hoover 2010: esp. lix-lxiv). During the Roman period, several islands (e.g., Chios, Samos, Lesbos, Cos, Rhodes, and Ios) enjoyed the right to mint their own coins in order to be used locally, but it was the Roman currency that dominated exchange (Heuchert 2005: 29–40, Maps 3.1, 3.2.1, 3.2.2).

Future Directions

The Greek islands are an ideal theater for exploring the ideas, agendas and methods employed in island archaeology. The first major steps in this direction have been made by several recent publications (e.g., Broodbank 2000; Berg 2007), but these studies focused so far mainly on prehistoric periods. More efforts should be made to analyze the Early Iron Age and later periods, as island archaeology is vital in order to enhance our understanding of past communities in the Greek islands. Moreover, interdisciplinary research projects should be intensified. The systematic involvement of palynologists, archaeobotanists, zooarchaeologists, osteoarchaeologists, geologists, mineralogists, etc. in fieldwork and material analysis will contribute to the fuller exploration of the islands.

Some islands have been investigated for many decades, and as a result, much information about their archaeology and history is available. However, there are still several islands that are less well explored, while others have had little or no exploration. Therefore, in some cases, scholars have based their work on incomplete data, and as the flow of information increases, their interpretations are proved to be not valid. For example, until quite recently, Zagora was considered as the only major settlement on Geometric Andros. In the last decades, however, another important settlement was excavated at Hypsele, completely changing the picture of the settlement pattern of Andros during the Geometric period. Excavation is a very time-consuming and expensive process, but intensive surveys may provide a fuller picture of the archaeology of the Greek islands and assess the risks and impact that development projects will have on archaeological heritage.

Finally, it is important to note that archaeology is not just for scholars but for all society. Unfortunately, there are several sites where the excavation was completed many years ago, but the final publication has not yet been produced; thus our information comes mainly from preliminary reports. Excavators should publish the results of their studies as soon as possible and inform both the scientific community and the general public (especially the local communities) about their work. Also, the enhancement of the archaeological sites is very important in order to make them accessible and readable to everyone.

Green, Jeremy N.

Myra Stanbury
Department of Maritime Archaeology, Western Australian Museum, Fremantle, WA, Australia

Basic Biographical Information

Jeremy Green (Fig. 1) is Head of the Department of Maritime Archaeology at the Western Australian Museum, a position he has held since 1971. After receiving a B.Sc. (Hons) in Physics from the University of Hull (1963), and a B.A. (Hons) in Physiology at Oxford (1966), Jeremy worked at the Research Laboratory for Archaeology, Oxford University (1967–1971). Here, under the direction of Professor E.T. Hall (1924–2001), a leading expert in archaeometry and the development of scientific techniques to examine archaeological discoveries, Jeremy developed an underwater metal detector, a proton magnetometer, and four systems of underwater photogrammetry. These techniques and instruments were investigated in field conditions in England, Ireland, and in the Mediterranean. Jeremy deployed them on shipwrecks such as the Byzantine wreck at Yassi Ada, the late fourth-century BCE Greek merchant shipwreck at Kyrenia, the Spanish Armada ships *Santa Maria de la Rosa* and *Trinidad Valencera*, the Dutch East Indies ship *Amsterdam*, and various sites around Cyprus dating from the Classical to the Byzantine period.

Green, Jeremy N., Fig. 1 Jeremy N. Green, Head, Department of Maritime Archaeology, Western Australian Museum. (Photo: Glen Martin)

Major Accomplishments

Jeremy Green's appointment to the Western Australian Museum arose out of a need for expertise to manage a number of significant shipwreck sites that had been legally protected under the jurisdiction of the museum. He set up the Department of Maritime Archaeology and established a program involving presettlement, post-settlement, and wreck inspection work. Jeremy Green's expertise was initially applied to the survey and excavation of the English East India ship *Trial* (1622), and the Dutch East India ships *Vergulde Draeck* (1656) and *Batavia* (1629), and later the preliminary work on the *Zeewijk* (1727) and *Zuytdorp* (1712). The excavation of the *Batavia* was the first archaeological excavation of a post-medieval shipwreck in the world and certainly Australia's most significant maritime archaeological excavation. Assisted by an Australian Research Council grant, and an Honorary Research Fellowship at the Institute of Archaeology, University of Oxford, Jeremy Green pursued a research program investigating early seventeenth-century shipbuilding techniques and Asian ships. He collaborated with international colleagues over the reconstruction of the *Batavia* timbers and the *Batavia* Reconstruction Project in Lelystad, the Netherlands, and expanded his work to sites in the Indian Ocean, Southeast Asia, and East Asia.

Aimed at developing a sustainable network between maritime archaeological practitioners and avocational groups throughout Australia, Jeremy Green co-founded the Maritime Archaeological Association of Western Australia

(MAAWA) (1973), shortly followed by the Australasian Institute for Maritime Archaeology (AIMA), of which he was foundation President and Editor of its Bulletin and Special Publications from 1977. In 1980, Jeremy Green initiated the first of a series of postgraduate diploma in maritime archaeology courses through Curtin University of Technology (WA); his book *Maritime Archaeology: A Technical Handbook* (1990, 2004) was designed as a primary reader for subsequent postgraduate courses, practicums, teaching, and supervision of students from Flinders and James Cook Universities, the University of Western Australia, and overseas interns. He also provides technical advice and services to professional practitioners in the use of remote sensing equipment – magnetometers and side scan sonar – and the computer software packages that have radically changed the efficiency and application of this type of equipment for locating, surveying, and mapping shipwreck sites.

Scientifically motivated, Jeremy Green was the first to install computer technology into a curatorial department at the Western Australian Museum, progressively developing shipwreck and artifact databases that provided the initiative for a national online system – the Australian National Shipwreck Database (http://www.environment.gov.au/heritage/shipwrecks/index.html). Always eager to experiment with new technology to improve underwater surveying techniques, Jeremy has trialed different computer programs – PhotoModeler, VirtualMapper, and Rhino – on Australian and international shipwreck sites to test their accuracy and usefulness in different situations.

Jeremy Green's career includes a long span of field and academic experience around the world. He has provided expert advice to governments embarking on maritime archaeological programs; assisted with the training of overseas personnel through UNESCO Regional Workshops and local training programs in places such as Thailand, China, and Sri Lanka, to advance underwater cultural heritage in these countries; and participated in numerous international conferences. In addition to leading the first archaeological project in China after the Cultural Revolution, Jeremy Green's work has taken him to Mombasa, Thailand, Japan, Korea, Malaysia, People's Republic of China, the Maldives, Philippines, Sri Lanka, Sicily, and Turkey. Reports on the various projects may be found in his extensive list of publications (http://www.museum.wa.gov.au/maritime-archaeology-db/maritime-reports).

In recognition of his expertise, Jeremy Green has been the recipient of numerous grants, fellowships, and awards, among them a Churchill Fellowship to conduct research work on the Dutch East India Company in Indonesia, an Australia-China Council grant to visit the Quanzhou ship in the People's Republic of China, and an Australia-Japan Foundation grant to work on the Kublai Khan Fleet in Japan.

Jeremy Green holds an M.A. from Oxford University and is an Honorary Research Fellow of the Institute of Archaeology, Oxford. He has held respected positions in Australian Universities including Honorary Fellow of the Centre for Archaeology, University of Western Australia, and Adjunct Associate Professor at Curtin University of Technology, Flinders and James Cook Universities. In 1994, he was appointed Head of the Australian National Centre of Excellence for Maritime Archaeology and is Editor of its Special Publication Series. He is a Fellow of the Australian Academy of the Humanities, Research Associate of the Institute of Nautical Archaeology, and Advisory Editor of the *International Journal of Nautical Archaeology*.

Jeremy Green's contributions to maritime archaeology have been acknowledged both in Australia and the United Kingdom. In 1986, he was awarded the Keith Muckelroy Prize for Achievement in the Field of Maritime Archaeology (UK). The following year, he was a finalist in the Bicentennial BHP Awards for the Pursuit of Excellence in Science and Technology. In 2003, he received an Australian Centennial Award and, in 2007, the prestigious Rhys Jones Medal in recognition of his pioneering work in the development of maritime archaeology in Australia. At the 2011 Inaugural Asia-Pacific Regional Conference on Underwater Cultural Heritage in Manila, Philippines, Jeremy Green was presented with the Asia-Pacific Maritime Archaeology medal in

recognition of his contribution to maritime archaeology, and in 2012 his long and dedicated service to the Australasian Institute for Maritime Archaeology (AIMA) was acknowledged with a special Appreciation Certificate.

G

Introduction

Located between 59° and 83° N and 11° and 74° W, Greenland (Kalaallit Nunaat) is an island in the North Atlantic spanning an area of 2,166,000 km^2, with approximately 80% of the land mass covered by the Greenland Ice Sheet. Greenland's ice-free margins exhibit notable topographic, environmental, and climatic variability (Fig. 1) with a coastline comprised of thousands of kilometers of low-lying island archipelagos, fjord systems, and rocky alpine hinterlands (Born and Böcher 2001). The ice-free areas of the island's High Arctic zones above 79° N consists of sparsely vegetated tundra and deserts. Moving south, the landscape changes between 79 and 72° N and can be generally characterized by a more oceanic climate dominated by low-lying heath and scrub vegetation. Below 72° N, the environment transitions dramatically into a Low Arctic zone with some areas of the interior so climatically mild that they can sustain pastoral farming.

Archaeological evidence has shown that the peopling of Greenland is the result of several distinct in-migrations (Fig. 2) broadly influenced by oscillating warming and cooling trends in the

Greenland, Archaeology of, Fig. 1 Climate zones of Greenland and important sites mentioned in the text. (© C.K. Madsen, Greenland National Museum and Archives 2019)

Arctic over past several thousand years (Arneborg 2004). At the same time, population densities have always remained low in Greenland, with human settlements primarily located along seaways and within the inner fjords. These maritime elements, although different in their individual expressions, are patterned across time in Greenland, with subsistence tied predominantly to exploitation of the island's vast abundance of coastal and marine resources.

The unifying characteristics of Greenland's different cultural historical groupings are remarkable considering that they represented very different geographic origins and technological traditions. The first in-migration occurred from the West via Ellesmere Island, Canada, along Greenland's northwest coast by peoples broadly labeled as Paleo-Inuit (in earlier literature as Paleo-Eskimo). Archaeologically, these groups all belonged to the Arctic Small Tool tradition (ASTt) and are represented in Greenland by the Saqqaq (2400–800/500 BC) and Independence I (ca. 2400–1300 BC) and Greenlandic Dorset (ca. 800 BC-AD 1) (Grønnow and Sørensen 2006). Following the Greenland Dorset, the island remained devoid of people for approximately 700 years until the arrival of the Late Dorset (ca. AD 700–1300), the last Paleo-Inuit group to settle in Greenland.

Between AD 1100 and 1300, Northwest Greenland was a geographical nexus for cultural contact between three distinct groups of people. Norse farmer-hunters from Iceland established two settlements in Southwest Greenland just prior to AD 1000 (Arneborg 2004). Historical texts and archaeological evidence support the theory that the Norse conducted long-distance hunting and exploration in the Eastern Arctic, eventually bringing them into direct contact with the Late Dorset in Northwest Greenland and native people of Labrador/Newfoundland (Appelt et al. 2016). Approximately AD 1250,

Greenland, Archaeology of, Fig. 2 Principal cultural sequences in Greenland's prehistory. (© GEUS, Ilulissat and Nipisat UNESCO nomination document)

Thule Inuit peoples originating from the Bering Sea region in the west arrived in Greenland, making cultural contact with both Late Dorset and Norse populations. The Thule culture brought a new and sophisticated hunting and transport technology, a high level of social organization, as well as a vast trading network spanning across the North American Arctic (Mathiassen 1927).

Whatever the nature of these cultural encounters, they were short-lived: the Late Dorset disappeared from Greenland ca. AD 1300, followed by the Norse by ca. AD 1450, leaving all of Greenland to be rapidly populated by the Thule Inuit. By AD 1500, the Thule had completely circumnavigated the whole of Greenland, gradually developing regionally distinct technologies, clothing, and dialects, with many of these elements still expressed by present-day Greenlandic Inuit descendants. Beginning in the late sixteenth century, European colonial explorers and later North Atlantic whalers made more frequent contact with Thule Inuit populations in Greenland (Gulløv 2016b). Increasing opportunities for lucrative trade between Europeans and Inuit residing on the West coast eventually led to the founding of the first official colony under the Kingdom of Denmark-Norway at Haabets Øe in 1721 by

missionary Hans Egede. The colony was later relocated to Nuuk, Greenland's present-day capital. The growing European presence in Greenland after 1721 and the onset of the colonial period initiated the gradual dilution of the traditional Thule way of life over the eighteenth and nineteenth centuries, with the colonial period lasting until Greenland was officially incorporated into the Kingdom of Denmark as a county in 1953.

Archaeological Cultures of Greenland: Key Characteristics

Arctic Small Tool Tradition (ASTt)

In Greenland, early Paleo-Inuit cultural traditions are archaeologically identified as regional variants within the larger Siberian and North American Arctic Small Tool tradition (ASTt). Technologically, this tradition comprises a highly idiosyncratic microblade tool kit originating in the Bering Strait region approximately 5500 years ago (Slaughter 2005). Recent aDNA research also supports a common genetic origin (and relative genetic isolation) of the ASTt archaeological cultures (Raghaven et al. 2014). While there are probably several causes for the eastward migration of these peoples into Greenland beginning approximately 4500–4200 years ago, pioneer groups were most likely drawn by the stable abundance of marine resources offered by the Smith Sound-North Water Polynya in the Baffin Bay. The overlapping concentration of Paleo-Inuit settlements at these resource-rich polynyas emphasizes the central role of marine mammal hunting (predominantly seal and whale) in Paleo-Inuit diets, although more subtle cultural differences in the exploitation of Arctic marine and wildlife species are now becoming more discernable with the availability of high-resolution paleofaunal genetic analysis (see Seersholm et al. 2016).

ASTt habitation sites are generally characterized as seasonal or temporary camps comprised of a few small tents or dwellings made of skin-covered, wood- or bone-framed tent structures, only visible to archaeologists today by the remains of small areas with stone flagging, tent rings, and shallow depressions. The most conspicuous architectural aspect of the ASTt dwellings is the presence of mid-passage structures with a rectangular and compartmentalized central hearth, interpreted by some to represent male and female spheres of activity (Andreasen 2004; Grønnow 2017). These hearths are also thought to be an advanced pyro-technological adaptation to the woodless Arctic (Odgaard 2003). In general, the ephemeral character of the archaeological record left behind by the ASTt cultures is suggestive of a high level of seasonal and regional mobility typical of small-scale Arctic hunter-gatherer societies.

Saqqaq and Independence I

Early Paleo-Inuit populations in Greenland are differentiated between the Saqqaq and Independence I cultures; the two groups identified as culturally related but distinct by virtue of their geographical separation and divergent lithic technologies. Bounded to the remote parts of North and Northeast Greenland, the Independence I lithic tool kit is characterized by large bifacial knives, adzes, tanged projectile points, broad microblades, and unground burins (Fig. 3), whereas the Saqqaq are noted for their preference for a local metamorphosized slate known as *killiaq* and a chaîne opératoire centered upon the production of bifacial knives, projectile points, adzes, scrapers, and ground burins (Fig. 4). Archaeological artifacts recovered from two permanently frozen sites in Disko Bay, West Greenland, have also demonstrated that Saqqaq technology was remarkably advanced and comprised a wide range of tools derived from organic materials (e.g., bows and arrows, lightweight harpoons and lances, wooden spoons and storage containers) (Grønnow 2017). The Saqqaq people were the longest inhabitants of Greenland with a duration spanning almost two millennia (2400–800/500 cal. BC) (Grønnow 2017).

Greenlandic Dorset

Approximately 800 BC, a distinctly different Paleo-Inuit group emerges in Greenland's archaeological record. Previously known as

Greenland, Archaeology of, Fig. 3 Examples of Independence I stone tools. Top: three knife blades. Below, left: two scrapers. Below right: two side scrapers. (© The National Museum of Denmark)

Independence II and Dorset I, the Greenlandic Dorset are identified throughout Greenland, with occupations frequently located on the same sites formerly occupied by Saqqaq and Independence I peoples (Jensen 2016). In terms of typology, Greenlandic Dorset lithic assemblages possess a higher proportion of microblades compared to earlier Saqqaq and Independence assemblages, as well as burin-like tools (BLTs), side-notched endblades, and scrapers with flared edges. Greenlandic Dorset peoples also showed a distinct preference for microcrystalline quartz that included colorful agate and quartz crystal (Fig. 5) (Grønnow and Sørensen 2004). At some point during the first millennium BC, the Greenlandic Dorset disappear, leaving Greenland absent of humans for approximately seven centuries, until the arrival of Late Dorset populations in Northwest Greenland sometime after ca. AD 700.

Late Dorset

Late Dorset culture represents the final expression of the ASTt in Greenland. These peoples settled over an enormous territory in the North American Arctic, spanning from Victoria Island in the west to Greenland in the East and as far south as Labrador (Appelt et al. 2016). However, in spite of their geographical reach and when contrasted against the previous phasing of earlier Paleo-Inuit groups, the Late Dorset in Greenland are observed to be relatively short-lived and restricted to the northwest part of the island (around the North Water Polynya). Late Dorset technology in Greenland conforms generally to earlier Dorset typologies but curiously lacked certain composite tools such as the bow drill, inflated drag float technology, and the bow and arrow, as well as the absence of dogs, dog sledges, and large watercraft (Appelt and Gulløv 2009). Late Dorset

Greenland, Archaeology of, Fig. 4 Saqqaq bifacial knife blade with preserved haft from Qeqertasussuk site, Disko Bay, West Greenland (approx. 16 cm in length). (© The National Museum of Denmark)

peoples are noted for their highly variegated microblades, as well as endblades and knives, adzes, scrapers, and BLTs used for working bone, antler, and ivory into tools and a variety of figurines (Fig. 6). Polished soapstone was also commonly employed in the furnishing of small lamps and cooking vessels.

The Late Dorset stand apart from other earlier ASTt cultural groups by their construction of megalithic common houses (or ceremonial structures) with connected hearth rows and an intricate ivory carving tradition that is believed to have reflected a very distinct set of religious practices (Betts et al. 2015). The Late Dorset were also the only ASTt cultural group in Greenland to exploit native metals – both copper imported from Western Canadian Arctic and meteoric iron scavenged from meteor fragments in the southern Avanersuaq (Thule) region. Shifting ranges of important marine resources such as walrus due to climate oscillations and the encroachment of the Thule into traditional hunting grounds are suggested as key factors in the redistribution and

eventual disappearance of the Late Dorset in Greenland (Appelt et al. 2016).

The Greenland Norse

The settlement of Greenland was the last westward migration of Scandinavian peoples across the North Atlantic during the late Viking Age. According to medieval texts, this migration occurred after the Norwegian-born Eric the Red led a small fleet of colonists from Iceland to Greenland ca. AD 985/986 (Arneborg 2004). The Norse established two main settlement areas, the *Eystribyggð* (Eastern Settlement) in South Greenland and the *Vestribyggð* (Western Settlement) in the Nuuk Fjord in West Greenland. Christianity was introduced quite rapidly into Norse Greenland beginning in the late tenth century and brought with it a character of society similar to developments occurring in neighboring Iceland and Scandinavia during the Middle Ages.

Norse economic and religious life in Greenland centered around larger estate farms, which became centers of law, trade, and commerce. These larger estate farms would often oversee several smaller tenant farms in the surrounding fjords.

Estate farms organized the labor and ships necessary for the seasonal hunting forays into North and East Greenland, a fact supported by both historical accounts and archaeological finds of Norse artifacts in contemporaneous Late Dorset or Thule culture contexts (Gulløv 2016b). Exploratory journeys from Greenland to the North American coast may have taken place as early as ca. AD 1000, continuing up through the middle fourteenth century (Grønlands Historiske Mindesmærker 1838). The Norse site at L'Anse Aux Meadows, Newfoundland (Ingstad 1977), most likely represents a specialized base camp relating to early Norse exploration of the North American mainland (Wallace 2003).

The geographical extent of Norse settlement in Greenland conforms to the subarctic environmental limits of farming in the North Atlantic, reflecting a society based on sedentary pastoralism with cattle, pig, sheep, and goat husbandry and horses for transport (Arneborg et al. 2012). Some 570 Norse sites are currently registered in the *Eystribyggð* and approximately 100 in the *Vestribyggð*. However, less than half of these sites were actual farmsteads, the remainder being seasonal satellites that provided the Norse with access to Greenland's vastly scattered terrestrial and marine resources (Jackson et al. 2018). Recent zooarchaeological and isotopic research has demonstrated that the importance of farming decreased over time, likely in response to deteriorating climatic conditions (Smiarowski et al. 2017). This included an overall decline in livestock populations during the thirteenth and fourteenth centuries AD and a phasing out of pig husbandry and a greater reliance on sheep and goat herding.

By the fourteenth century AD, some farmers appear to have subsisted on a diet comprised of up to 80% marine mammal (i.e., seal) at a level comparable to some later Inuit hunters (Arneborg et al. 2012). The shift to marine mammal hunting may have come quite naturally as the Norse were already engaged in the seasonal hunting of Arctic game such as walrus, narwhal, and polar bear in the North. Recent research suggests that harvesting of such resources may have been a primary pull factor that motivated the initial settlement of Greenland (Frei et al. 2015). Arctic walrus and whale ivory, narwhal tooth, and animal skins provided the Norse with a diverse set of valuable commodities that could attract foreign merchants to Greenland. These socioeconomic links to Scandinavia remained important to the Greenland Norse for several reasons, the most important being the import of raw iron used to produce tools and weapons. Historic sources suggest that the Greenland Norse actively attempted to maintain cultural and trade networks by securing the establishment of a local bishopric in AD 1126 and voluntarily submitting to the dominion of the Norwegian Crown in AD 1261 (Arneborg 2003).

The Norse settlement of Greenland lasted until sometime in the fifteenth century, with abandonment of the *Vestribyggð* ca. AD 1350 and the last written source from the *Eystribyggð* with reference to Hvalsey Church dating to AD 1408 (Fig. 7). Archaeological dates have largely corroborated this overall chronological framework, although some parts of the *Vestribyggð* may have survived until ca. AD 1400 and the *Eystribyggð* until ca. AD 1450 (Arneborg et al. 2012). The unexplained fate of the Norse in Greenland remains a dominating research theme, and today, most scholars believe the decline of the Norse settlements in Greenland was caused by a number of coinciding factors that included a deteriorating and unpredictable climate, growing geographic and cultural isolation, political and economic shifts in Northern Europe, and perhaps competition and/or violent encounters with the expanding Thule population.

Thule Culture-Historic Inuit

Around 1000 AD, Thule culture peoples from Northern Alaska migrated eastward across the Canadian High Arctic, arriving in Northwest

Greenland, Archaeology of, Fig. 7 Hvalsey Church in the Eastern Settlement. The Norse occupation of Greenland lasted until sometime in the fifteenth century, with abandonment of the Western Settlement occurring ca. AD 1350 and the last written source from the Eastern Settlement dating to AD 1408. Illustration by Th. Groth (1878) in Holm (1883, Fig. XX)

Greenland ca. 1250 AD (Friesen and Arnold 2008). By AD 1300, the Thule appear to have completely displaced the Late Dorset population in Northwest Greenland, spreading quickly along both the south and northeast coasts (Appelt and Gulløv 2009). By AD 1400, the Thule had reached as far south as the mouth of the Nuuk Fjord (ca. 64 ° N); their southerly advance halted only temporarily until the abandonment of the Norse Western settlement. With the abandonment of the Eastern Settlement ca. mid-fifteenth century AD, the Thule culture settled the last fjords in South Greenland, with some groups continuing eastward around Cape Farewell and up the east coast (Gulløv 2016b). At the same time, smaller groups of Thule settlers had migrated north along the coasts of Peary Land and northeastern Greenland, reaching as far as Ittoqqortoormiit (Scoresby Sound) at ca. 70 ° N. By the beginning of the sixteenth century AD, the Thule had completely circumnavigated the entirety of Greenland (Gulløv 2004).

Early Thule pioneers are characterized by their hunting of large whales, such as bowhead (Holtved 1954), an activity that required a high level of technological specialization and group organization. From an archaeological perspective, this was reflected in the development of new technological advances that include the heavy toggling harpoon, bladder floats, and long, wood-framed skin boats (*umiat*) (Fig. 8). This phase also saw the emergence of multiple house settlements and special men's houses (*qassit*) that reflected elements of the Old Bering Sea whaling tradition (Gulløv and McGhee 2006).

Seasonal mobility was a prerequisite for survival for the Thule and was reflected in a variety of sea and ice transportation systems such as the kayak, *umiaq*, and dog sledges that were used for both hunting and long-distance travel. Winter settlements were located in the outer fjords and coasts with single and/or multifamily houses clustered on shorelines with immediate access to the sea. These stone-and-sod-built dwellings possessed subterranean cold trap passages, designed to prevent heat loss from the main living area during the cold winter months (Fig. 9) (Gulløv 2004). In the woodless High Arctic, whale bones were frequently used for support beams for roofing for these structures, whereas driftwood was

Greenland, Archaeology of, Fig. 8 In 1949, during an expedition led by the archaeologist and polar explorer Eigil Knuth in Peary Land discovered the remains of an extremely well-preserved Thule umiaq (women's boat), dated to ca. fifteenth century. (Photo: E. Knuth (1952), © The National Museum of Denmark)

more frequently used in the southerly regions when available.

In the summer, families moved inland to strategically located camps where Arctic char, caribou, and gathered edibles were known to be plentiful. While whaling was an economically important activity for the Thule in many parts of Greenland, the seal and its by-products constituted one of the most important resources for the individual hunter and his family. Seal meat provided one of the main forms of sustenance, afforded lamp oil for heat and light, as well as warm skins for waterproof clothing, boots, and mittens. Several characteristic elements of the Thule Inuit material culture reflect the importance of the seal hunt, such as the kayak, toggling iron-tipped harpoons, bladder floats, traditional flensing knife (*ulu* or women's knife), and steatite blubber lamps. In general, the Thule possessed a highly diverse and sophisticated hunting arsenal that reflected an adept utilization of both locally available and exotic components (stone, wood, antler, bone, tooth, sinew, baleen, metal, etc.). Watercraft, tools, domestic utensils, and clothing also comprised a highly diverse combination of composite materials, some of which could only be acquired through long-distance trade.

Long-distance trading networks were vital to the Thule culture in Greenland for several reasons. While it is hypothesized that access to meteoric iron in Northwest Greenland and trade with the Norse could have been an important pull-factor in the early Thule culture migrations ca. thirteenth and fourteenth centuries (McGhee 2009), the seventeenth to eighteenth centuries saw the formalization of an elaborate regional exchange network that ensured the continual flow of valuable resources up and down the Greenlandic coasts: fox skins and driftwood from South Greenland moved north to be traded for caribou skins and steatite from central West Greenland and baleen and ivory tusks from North Greenland (Gulløv 1997). With the arrival of European whalers in the seventeenth century, new exotic items such as metal, beads, textiles, and other trinkets entered this network with large groups of families gathering together to exchange goods at certain times of the year at designated trading sites (*aasiviit*).

Greenland, Archaeology of, Fig. 9 Reconstruction of a Thule winterhouse from Hekla Havn in the Scoresby Sound, East Greenland, ca. 1891–1892. A long and narrow subterranean cold trap entrance (**a**) helped to minimize heat loss from the main dwelling area. (After Ryder 1895:297, Figs. 1–2)

Along the coast, the seasonal aggregation of large groups of people during the winter months is also observed archaeologically by the presence of large, sod-and-stone-built common houses, where upward of 40 people could reside in a single living space (Gulløv 2016b).

Increasing population and competition for subsistence and trade resources could also in part explain the appearance of new burial customs that emerge during this apex of the Thule culture in Greenland. While graves and human remain of the Early Thule Culture are difficult to identify – just as in the Paleo-Inuit cultures – the period after ca. 1450 AD saw the creation of highly visible funerary landscape across all of Greenland. Individuals were buried in stone-built chambers or hollow cairns that ranged in appearance from very small and rudimentary to large and almost monumental in character, frequently integrating elements of the local topography. The dead were commonly interred with objects and clothing needed for the afterlife, either placed directly within the grave itself or in an adjacent chambers. The few systematic archaeological investigations of Thule culture graves suggest frequent reuse of grave chambers and the removal and re-internment of individual skeletal materials and grave goods. One of the most famous and earliest Thule culture graves was found at Qilakitsoq in the Upernavik District in the early 1970s,

containing the remains of eight, naturally mummified individuals: six women and two children dating to ca. AD 1475 (Hansen and Gulløv 1989). Among the accompanying grave goods was some of the earliest and well-preserved examples of Thule skin clothing found in the Arctic. Traditional Thule Inuit culture burial customs appear to gradually disappear, replaced by more formal Christian burial practices over the course of the eighteenth and nineteenth centuries.

The establishment of permanent colonies and mission stations by the Kingdom of Denmark-Norway beginning in AD 1721 – in combination with epidemic diseases and the disruption of the aforementioned trade networks – marks the terminal phase of the Thule culture in Greenland. The transition from Thule to historic Inuit was a gradual process following the wake of a growing colonial presence that continued little by little until final contact was made with the last isolated communities in East Greenland in the 1880s.

Key Issues/Current Debates

The methodological maturing of archaeology as an academic discipline in Greenland developed parallel to antiquarian and cultural historical paradigms developing in Europe and North America in the late nineteenth and early twentieth centuries (Gulløv 2016a). This was later superseded by more pure archaeological research agendas focused on identification, classification, and sequencing of Greenland's prehistoric cultures (Grønnow 2005). This trend continued through the postwar decades and also saw the implementation of more modern, systematic approaches to excavation and survey (Gulløv 2004).

In the 1970s, the introduction of the New Archaeology's hypothesis-driven and process-oriented approach initiated a surge in archaeological research activity in Greenland, manifested through a series of important international and interdisciplinary research projects spanning the 1980s and 1990s. While archaeologists in Greenland have long abandoned the implications of environmental determinism and embraced more balanced views on human-environment relationships and ecodynamics, the research perspectives of postprocessual currents of archaeological practice never gained a strong foothold. The continued research impetus on environmental and ecological aspects of human livelihood in Greenland may be a consequence of the region's perceived marginality, combined with the predominance of climate and paleoenvironmental research taking place in Greenland over the last 50 years.

What archaeological and ethnographic evidence has broadly demonstrated is that past peoples in Greenland possessed incredible creativity and resilience in overcoming the environmental constraints of the island's geography. Yet questions about the origins of the Saqqaq and Independence I cultures – and ultimately their disappearance – are still on the archaeological agenda. Results of excavations during the last decades in conjunction with aDNA studies and a new series of radiocarbon dates have reinforced the empirical background concerning the temporal and spatial ranges of the pioneer societies and their roots in Canadian and Alaskan prehistory (Grønnow 2017).

Along these same lines, several other important questions remain unresolved in Greenland: for example, what kind of demographic, social, and economic forces drove the Eastern expansion of the Paleo-Inuit pioneer societies after a "standstill" in the Western Canadian Arctic? According to earlier radiocarbon dates, the entire island of Greenland was settled within two to three generations – and it is difficult to understand such a comprehensive migration episode with reference to current ethnographic and demographic knowledge. Could the Saqqaq have influenced Pre-Dorset peoples in Canada via "backward" migration through the High Arctic gateway (North Water Polynya) between Avanersuaq and Ellesmere Island? This could potentially be indicated by the spread of the blubber lamp technology (Grønnow et al. 2014). Additionally, when and how did the Saqqaq become isolated from concurrent social developments taking place in neighboring Arctic Canada? Analyses of the archaeological material suggest that Saqqaq material culture remained practically unchanged for

almost two millennia, a fact that could suggest the cultural/demographic isolation of Greenland (possibly during the last centuries of the Saqqaq period).

Furthermore, the complex and discontinuous cultural history of the High Arctic gateway between Canada and Greenland remains a jigsaw puzzle. Questions still linger as to when and how the Early Greenlandic Dorset replaced the Saqqaq in West Greenland. Due to a plateau on the calibration curve, ca. 800–400 BC, radiocarbon dates remain a weak source for resolving this problem, and future research must rely on "classic" archaeological analyses of stratigraphy and material culture.

The Norse – frequently credited as failing to overcome the challenge of Greenland's environmental limitations due to an intransigent dependence on farming – are now known to have been quite adept at modifying their landscapes by increasingly incorporating sea mammals into their diets to accommodate environmental uncertainty beginning in the thirteenth to fourteenth centuries (Arneborg et al. 2012; Jackson et al. 2018). Extensive use of widely scattered task sites is identified as a key to this success (however, at the time of this publication, very few of these sites have been excavated to ascertain their precise function and chronology). Oversimplified narratives of "collapse" due to resource depletion and the onset of the Little Ice Age have been replaced with new explanations that now emphasize the role of local environmental histories, sustainable resource management, and complex social hierarchies, combined with larger historical interactions of Greenland in the medieval European economic sphere of the North Atlantic, ca. early to middle fifteenth century AD (Hartman et al. 2017; Jackson et al. 2018).

Lastly, Thule peoples were able to find ways of exploiting almost every environmental niche within Greenland, a feat accomplished through a combination of highly specialized hunting and transportation technology and intergenerational knowledge of the land and sea that has survived to the present day. With a new, more nuanced chronological framework for the expansion of the Thule culture and an increasing inventory of Norse artifacts found in Thule culture contexts, the nature of Norse-Inuit interactions is again re-emerging as an important research theme. Early dates of a few Thule culture sites in the Norse settlement areas suggest a possible pioneer contact phase (Golding et al. 2011), but more dates are required from comparative contexts. At the same time, Thule culture sites along Greenland's southwest coast to date remain virtually unexplored.

International Perspectives

Over the past 40 years, Greenland has emerged as one of the world's foremost climate libraries, providing researchers with more accurate and high-resolution models of historic climatic and environmental variability at both the regional and global scale. A cold and dry Arctic climate has generally encouraged the survival of ancient organic remains and even human soft tissue – a factor that has made Greenland's archaeology unique within the global context. The Greenland ice sheet has also been a boon for understanding long-term changes occurring to earth systems and historically variable human responses to such change over the past several millennia (see Behringer 2010).

However, localized climate effects due to a warming Arctic in the twenty-first century are also having deleterious impacts on the archaeological record in Greenland as is observed in other parts of the Arctic (Matthiesen et al. 2014; Hollesen et al. 2016). This has seriously implications for the country as the loss of once outstandingly preserved organic deposits due to warming soil conditions appears to be rapidly increasing and may unfortunately but ultimately provide a valuable case study for similar processes taking place in other subarctic and alpine regions around the world. Great efforts are currently being made to examine the processes dictating the loss of organic material in Greenland, and these insights could potentially have important implications for the global loss of archaeological resources as environments continue to transform due to effects of climate change in the twenty-first century and beyond.

Future Directions

Greenland offers several potentials for innovative archaeological research. In the short term, what we expect to see in Greenland in the coming decades is a greater emphasis on new remote-based technologies and drone surveillance (Fenger-Nielsen et al. 2019) that can provide a level of geospatial data previously unavailable. Additionally, improvements in high-resolution aDNA studies are already revealing new information about the movement and migration of peoples across the North American Arctic and Greenland (e.g., Raghavan et al. 2014; Rasmussen et al. 2010; Lopopolo et al. 2016). At the same time, the appointment of Greenland's two new UNESCO World Heritage properties, Kujataa and Aasivissuit-Nipisat, offers the possibility for renewed international focus on the country's outstanding archaeological legacy and the recognized universal value of Greenland's cultural landscapes. Paralleling these developments are new legal frameworks will help to ensure the survival of Greenland's tangible and intangible heritage for future generations.

While the Greenland National Museum and its international partners are currently exploring new opportunities to ensure the survival of Greenland's cultural patrimony, future challenges may extend beyond the capacity of the country's museum network to fully mitigate all the changes anticipated over the coming century. This situation may be compounded by the coupling of human impacts combined with climate change as Greenland becomes increasingly accessible and a prime destination for international visitors seeking to experience Greenland's unique history, wildlife, and other natural phenomena. These new situations call for highly targeted and collaborative research efforts that build upon new interdisciplinary scientific investigations while engaging local communities to actively participate in the creation of new types of knowledge systems that extend beyond the traditional empirical focus of evidence-based archaeological inquiry.

Greenland's marginal and variegated environmental diversity have proven an important factor in shaping human life and livelihood in the Eastern Arctic over the last 4000 years, and these case studies could offer important analogs for modern human responses to climate change effects currently taking place throughout the Circumpolar North. Simultaneously, these same effects pose the greatest risk to the survival of the once outstandingly preserved archaeological record in Greenland. Future archaeologists working in Greenland must contend with this dichotomy while maximizing efforts to salvage as much data as possible before it is lost.

State of Knowledge and Current Debates

Introduction

The prehistory of Greenland is the story of successive migrations of Arctic hunters entering Greenland from what is now Canada. According to the archaeological record, the first humans to set foot on Greenland were the Independence I culture who spread from High Arctic Canada to North Greenland about 4500 years ago. During the next 3000 years, people of the Saqqaq, Independence II, and Dorset cultures followed (Gulløv 2004a). The first people to introduce a "writing" culture, however, were Norse colonists, who emigrated from Iceland to the southern subarctic parts of the Greenland west coast around AD 980. Unfortunately, we do not have written accounts from the Norse Greenlanders themselves; most information concerning events in Greenland was

written down in either Iceland or Norway. About 200 years after the Norse had become established in South Greenland, a new group of Arctic hunters, the Thule Inuit, arrived in North Greenland from Canada. Calling them Skrælings these were the first Inuit to be described in texts by the Norse, commencing just before 1200 AD.

Historical Background

According to early historical sources from Iceland and Norway, Icelanders under the leadership of Erik the Red migrated to Greenland around 985, where they settled in what they called the Eastern Settlement in what is today Kujalleq municipality and in the Western Settlement close to Nuuk. Dependence on the European markets for Arctic exotics primarily walrus tusks however extended their resource area northward, to the Disko Bay where the sought-after mammals were caught (Fig. 1).

In the broader perspective, the settlement in Greenland was the last step in the colonization of the North Atlantic Islands which began with the settlement of the Faroe Islands and Iceland in the latter part of the ninth century. Most of the immigrants, if not all, were Christians when they arrived in Greenland (Fig. 2), and around 1124, the first Greenlandic bishop was appointed from Norway, and in 1261 Greenlanders became subjects of the Norwegian king. The last bishop residing in Greenland died in 1378, and in the same period, the Western Settlement is reported as being abandoned.

Thirty years later, in 1408, an Icelandic couple married in the Hvalsey Fjord Church in the Eastern Settlement, and the attestation of their marriage is the last written testimony of life in the Norse settlements in Greenland (GHM III) (Fig. 3). Archaeology indicates that life in the Eastern Settlement continued to around the middle of the fifteenth century.

Scandinavia lost contact with the Norse settlements in the 1420s, and permanent contacts were only re-established in 1721 when the Danish-Norwegian priest Hans Egede established a small European colony called Godthåb (the Good Hope), in present-day Nuuk and what was formerly the Norse Western Settlement.

The history of the early years of Norse settlement in Greenland is based on Icelandic and Norwegian historical accounts and Icelandic sagas written down in the thirteenth century from much older oral tradition. Later periods are based on contemporary Icelandic annals, contemporary ecclesiastical correspondences, and topographical accounts, the latter often only known from much later copies.

Archaeology and the study of material culture (i.e., ancient monuments and primarily runic inscriptions) was introduced in Norse Greenlandic research early in the nineteenth century, peaking in the beginning of the twentieth century, and often with closely defined problems originating from a reading of the written sources, and, as was the common attitude to medieval archaeology at the time, the archaeological record was interpreted from the perspective of the written sources. Discussions of the chronology of the settlements depended entirely on written accounts, for instance, and archaeology only served to illustrate and verify what was already understood from the written sources. The medieval topographical accounts were used to identify and name the ruins of farms and churches in the landscape, several of which were subsequently excavated. Among others, key sites investigated during this phase included Erik the Red's farm Brattahlid (now the present-day settlement of Qassiarsuk); Gardar, where the bishops lived (present-day Igaliku); and Herjolfsnes (present-day Ikigaat), the southernmost of Norse farms mentioned in the accounts (Arneborg 2006).

In the late twentieth century, processual archaeology began to have more influence on approaches to the archaeology of Norse Greenland, encouraging a focus on the kind of social and economic questions that only archaeology can answer. For a period, archaeologists ignored churches, dwellings, and the stables and barns of the manor farms and turned instead to excavation of middens so as to recover data that could provide insights into the economy of the farms. This produced fresh insights. In particular, while the written sources and the settlement pattern gave the impression of an economy based on pastures and animal husbandry, the animal bone record

Greenland: Approaches to Historical Norse Archaeology, Fig. 1 The Norse settlements are both located on the west coast of Greenland. The Eastern Settlement around 60° N in present-day Kujalleq municipality and the Western Settlement around 64° N near Nuuk in Sermersooq municipality. The northern hunting grounds concentrated around the Disko Bay in West Greenland. (Google Earth)

indicated that marine resources played a much larger role than formerly recognized. In addition, careful, stratigraphically controlled excavations and the introduction of radiocarbon dating provided new insights into changes over time. These showed that the dependence on the marine resources increased over time. The animal bone record also revealed social differences between the cattle-based manor farms, often with connected churches, compared to the smaller farms, where sheep and goats dominated (McGovern 1985).

Today, midden excavations and the application of the methods and approaches of historical ecology, social history and archaeology, environmental archaeology, and the natural sciences still play a fundamental role in Norse Greenland archaeology. However, research has been expanded so as to get a broader perspective on questions such as the nature of social organization, systems of governance, variations in economy and subsistence, religious practices, and evidence for human well-being/suffering. This has prompted new surveys and excavations of farm buildings and churches

Greenland: Approaches to Historical Norse Archaeology, Fig. 2 Reconstruction of the so-called Tjodhildes Church in Qassiarsuk, the Norse farm Brattahlid. The remains of the small church were excavated in the beginning of the 1960s, and radiocarbon dates on skeletons from the surrounding cemetery indicate that the church was built in the late tenth century. (Photo: J. Arneborg 2000)

and a revival of interest in artifact studies. Instead of single site studies, whole regions and the interaction of the many cultural elements of the landscape are now standard, and the results are interpreted from a broader perspective that include theoretical frameworks derived from social anthropology and "Annales"-oriented research, with special emphasis on human-human and human-environment interaction. Most research is also interdisciplinary including both natural sciences and humanistic social-science approaches, i.e., history, human bioarchaeology, zooarchaeology, archaeobotany, geoarchaeology, stable isotopic analysis, historical ecology, environmental modeling, and artifact studies.

Key Issues

Although there are many other topics of research, the following broad themes capture many of the current concerns in the historical archaeology of Norse Greenland. These are the enigma of Norse settlement, Norse Greenland ecodynamics, security and vulnerability, and the causes of depopulation.

The Enigma of the Norse Settlements

One of the key concepts to the New Archaeology was to seek explanations rather than just providing descriptions of events, and this has been a recurrent feature of Norse Greenlandic archaeology, also before the appearance of New Archaeology. Above all, the human story about Norse Greenland has been a story about colonization of virgin land, survival for half a millennium, and then disappearance. The enigma of the depopulation of the settlements has always attracted archaeological attention, and many explanations have been put forward.

Written accounts indicate hostile encounters between the Norse and the Thule Inuit who moved very rapidly from North Greenland southward toward the Norse settlements, and the explanation that the Thule Inuit wiped out the Norse

Greenland: Approaches to Historical Norse Archaeology, Fig. 3 The very well-preserved ruin of the church at the elite farm in the *Hvalsey* fjord in the Eastern Settlement where the wedding on 1408 took place. The church was built in the last part of the thirteenth century. The photo is taken from the festal hall and in between is the remains of the dwelling of the farm. (Photo J. Arneborg 2004)

population has for a long time been one of the most persistent explanations of Norse disappearance. The theory however was based on a mixture of preconceived ideas of the eighteenth-century colonists of what might have happened with the old Norse and the influence of the colonists on the local Inuit population (Arneborg 1993).

With the growing recognition of the damaging consequences of modern utilization of Earth's limited natural resources, the Thule Inuit theory was overshadowed by ecological explanations, and from the 1980s the prevailing explanation of the depopulation of the Norse Greenland settlements was one of maladaptation and ruthless exploitation of the very fragile natural resources. The impacts of climate changes have added yet another facet to the discussion.

In his famous book *Collapse – How Societies Choose to Fail or Succeed*, Jared Diamond (2005) summarized the state of play and argued that the Norse Greenland society collapsed for three related reasons. First, they depleted the environmental resources on which they depended by cutting down trees, stripping turf, and overgrazing their pastures, all of which resulted in heavy soil erosion. Second, they did not utilize additional and available food sources such as fish, ringed seal, and stranded whales, and third is because they had established a rigid social system that could not adapt to the changing world. All these arguments can be challenged on archaeological grounds.

Norse Greenland Ecodynamics

From 2007 intensive archaeological research has taken place in the Vatnahverfi region from the inland to the outer coast between the two fjords Igalikup Kangerlua and Alluitsup Kangerlua. Vatnahverfi is a ca. 500 km^2 large peninsula situated in the Eastern Settlement south of the elite farm Gardar, where the Greenlandic bishops lived. In the Middle Ages, Vatnahverfi was relatively densely populated, and the aim of the research is to study a larger region, for the first

time ever, with the focus on the interaction between the individual farms and between settlement and environment, and results from the Vatnahverfi project, and other linked projects indicate that the theories of maladaptation and unsustainable farming practices are contradicted by the material evidence. The Norse introduced a dynamic subsistence strategy based on animal husbandry making use of all available resources. The farm was the center of all life, being a flexible organism that dispersed to all usable resources, for all-year round or seasonal use (Madsen 2014) and including the participating in the local seal hunt and the long-distance walrus hunt.

Norse *landnám* did impact the environment. The introduction of animal husbandry and stripping off large areas of turf for house construction caused increased erosion, but in the long run, Norse interaction with the environment seems to have been sustainable, perhaps because of changes in subsistence strategies (i.e., from a predominantly terrestrial-based economy to a more marine economy) (Massa et al. 2011; Schofield and Edwards 2011; Arneborg et al. 2012; Bichet et al. 2014). Vatnahverfi, for instance, does not show erosion disasters of consequence – many farms established artificial irrigation systems, and they fertilized their grass fields perhaps in the hope to increase yields or at least to preserve status quo (Buckland et al. 2009). In the Norwegian text, *The King's Mirror* written around AD 1250 (Jónsson trans. 1920), it is stated that the Greenlanders had good pastures and large and good farms and that they held many heads of cattle and sheep for butter, cheese, and meat. Yet, the author also mentions that the Greenlanders in addition subsisted on meat from reindeer, whale, seal, and bear and both the animal bone record (McGovern 1985) and the δC13 and δN15 values measured on Norse human bones show that the marine component of the diet increased over time (Arneborg et al. 2012). From the middle of the thirteenth century, the subsistence economy shifted from a predominantly terrestrial diet to a more marine diet with seal as the prime meat producer.

The climate deteriorated in the settlement period (Masson-Delmotte et al. 2012), and climate changes could be part of the explanation of the increased dependence on marine resources – either because of easier access to seals or because of a decline in the pasture economy.

In the first period, settlement was concentrated in the inner and mid-fjord regions where pasture farming was possible (Fig. 4).

The large and most wealthy farms were situated in the inner fjords where conditions were by far the best. Large living houses, festal halls, byres for cattle, warehouses, and connected churches were clear marks of status (Fig. 5).

There are indications in the written sources that a smaller number of manors owned all the land and the farms sitting there (Jónsson 1930) and the reduction in the number of farms with a connected church at the same time as a limited number of much larger stone churches were constructed in a few core manors suggests a consolidation of power around a few great families from the thirteenth century onward. In the same period, marginal farms on less favorable locations were abandoned. In the late settlement period, farms were concentrated in the core areas around the fjords Tunulliarfik and Igalikup Kangerlua and Vatnahverfi (Madsen 2014).

During the period of climatic deterioration, the elite consolidated their farms in the inner fjords, pasture farming declined, the scale of animal husbandry decreased, and the subsistence economy became more and more dependent on the marine resources that were only available on the outer coast (Smiarowski et al. 2017). Moving inland to the more "rural" region at the same time as subsistence became more dependent on outer coast resources appears to be inconsistent and could be interpreted as cultural rigidity – but may in fact only have been partly so and then only pressed by the elite. Compared to the animal husbandry, seal kept people alive, and as long as the elite was able to control the resources and maintain the perception of Norse Greenland as a society based on farming and landownership, sealing would only support the prevailing social order, though also challenging cultural identity (Fig. 6).

Greenland: Approaches to Historical Norse Archaeology, Fig. 4 Heading for the Norse farm no. E162 in the southern part of the Eastern Settlement. (Photo: J. Arneborg 2015)

Depopulation

Although most focus has been on the subsistence economy, one should however not ignore the fact that the survival of the Norse in Greenland depended on both local subsistence *and* trade with Europe. Necessities such as iron had to be imported, and the Greenlanders' most important trade item was tusk ivory from walruses caught in the Disko Bay and northward (Fig. 1).

The walrus hunt was elite driven and it was the elite who controlled the foreign trade linking Greenland with North Atlantic/Scandinavian trading networks that provided the North European markets with Arctic exotics – first and foremost the walrus tusk. At home redistribution of imported items formed part of the elites' power base. In fact, recent research suggests that rather than the prospects of getting more land, it might have been the walruses and the access to the valuable walrus ivory that in the first place attracted the Icelandic settlers to Greenland (Frei et al. 2015). However, over time trade patterns changed, and the highly valued and very valuable walrus tusk lost prestige during the Middle Ages, especially as other ivory sources became more accessible, and it was no longer worth risk losing both ships and men to acquire it (Roesdahl 1995). As a result, in Greenland, the elite lost prestige and power pari passu as the calls by foreign merchants' ships become fewer and fewer.

International Perspectives and Future Directions

The Norse settlements in Greenland were populated for about 500 years. New research indicates that the Norse Greenlanders were well adapted – at least with respect to local subsistence economy, and economic strategies seem to have been sustainable. Still, Norse Greenland society faced several difficulties caused by climate changes, changed international trade relations, and, perhaps, the arrival of the Thule Inuit, circumstances that were out of their power to change. Altogether life in Greenland became difficult resulting in a decrease of population to end with the total depopulation (Lynnerup 1998).

One stress factor on Norse society of which we know very little was the appearance of the Thule Inuit in Greenland and in the settlements in particular. In a late twelfth-century Norwegian history book *Historia Norwegiae* (trans. 2008), we learn for the first time about Norse encounters

Greenland: Approaches to Historical Norse Archaeology, Fig. 5 The ruins of the Norse farm *Gardar* in present-day Igaliku. *Gardar* was one of the largest farms in the Eastern Settlement. The Greenlandic bishops lived here and ruin no. 1 is the cathedral. Ruin no. 8 is of the dwelling, and ruins nos. 9 and 14 are large byres with connected barns. The main buildings were placed centrally in the infield. The infield was used for growing grass for winter fodder for the animal husbandry that was kept in the byes and stables during winter. A fence surrounding the infield kept the grazing animals out of the infield. Water from dams in the mountains were led to the infield through the channels 49, 50, 51, and 52. (After Krogh 1982, National Museum of Denmark)

Greenland: Approaches to Historical Norse Archaeology, Fig. 6 Woolen dress found 1921 in the *Herjolfsnes* church yard in the Eastern Settlement C14 dated to the beginning of the 1400s. The dress is of contemporary European fashion and clearly shows the importance the Norse Greenlanders attached to their European identity. (Photo: National Museum of Denmark)

with the *Skrælings*. However, we do not know where these encounters took place and with whom. Rather than with the Thule Inuit, it might have been with their predecessors of the late Dorset culture (Appelt 2004). The presence of Thule Inuit in the Disko Bay region is documented archaeologically from the beginning of the thirteenth century onward (Gulløv 2004b), and encounters, friendly or hostile, between the two people must have been unavoidable. The archaeological record is still uncertain when it comes to the arrival of the Inuit to the Norse settlements. Nevertheless, if the Thule Inuit actually settled on the coast in the Norse settlements while the Norse were still living on their farms, the Thule – perhaps – would have been positioned to cut off Norse access to migratory seals. Future research may resolve this.

Another stress factor to the Norse society would be the standards of living in the Norse settlements and the human costs to climate change and elite decisions, especially when it came to the well-being and health of the population (Hegmon et al. 2014; Nelson et al. 2015, 2017). That too is for future research.

Finally, as research on these issues has progressed, from having been of local interest only, the fate of the Norse Greenlanders has now turned into a matter of global interest. Today ecologically orientated archaeology forms part of interdisciplinary studies on issues of sustainability, resilience, and the future of humans on earth, and Norse Greenland has turned into one of the classic examples of societies that did not make it. Against this background, future research in Norse Greenland is likely to seek to improve our understanding of the complex interactions of human governance, human well-being and health, climate change, human environmental impact, and world system effects.

Grimaldi, Stefano

Stefano Grimaldi
Laboratorio di Archeologia preistorica, medievale e Geografia storica "B.Bagolini", Dipartimento di Lettere e Filosofia, Università degli Studi di Trento, Trento, Italy

Basic Biographical Information

Stefano Grimaldi is an Italian archeologist who specializes in hunter-gatherer groups (Grimaldi 2009; Grimaldi and Flor 2009). He grew up in Rome and completed his graduate studies in Prehistoric Archaeology at the "La Sapienza" University of Rome (1992). He received a Ph. D. (1996) in anthropology in the same university under the guidance of Professor Amilcare Bietti.

Early in his career, Stefano Grimaldi worked as a field technician in several excavations in Europe. At the same time, he was co-founder member of a private company that specialized in cultural heritage management. Grimaldi has received research grants from the European Community to work in Portugal (1996–1999). In 1999 he was an assistant professor at the Instituto Politecnico de Tomar, Portugal, as a colleague of Luiz Oosterbeek. At this institution he taught prehistory, human evolution, and lithic technology. Since 2005 he has been an assistant professor at the University of Trento, Italy, teaching human evolution and European prehistory.

Since 2006 Stefano Grimaldi has been president of the "Human Occupations in Mountains Environments" Commission of the International Union of Prehistoric and Protohistoric Sciences. He is a researcher in the "Quaternary and Prehistory Group," Geosciences Center, at University of Coimbra, Portugal, and with the Instituto Terra e Memoria of Maçao, Portugal.

Major Accomplishments

Stefano Grimaldi's major accomplishments involve the development of a techno-functional approach to the study of lithic assemblages and new evidence from archaeological excavations in Italy and Portugal. Since 2007 Stefano Grimaldi has been a scientific director of excavations at the Middle-Upper Palaeolithic Riparo Mochi rockshelter, Balzi Rossi, Italy (Douka et al. 2012). Since 1999 he has been one of the scientists responsible for excavations at the Lower-Middle-Upper Palaeolithic Ribeira Ponte da Pedra open-air site in Portugal (Grimaldi and Cura 2009).

Groslier, B. P.

Aedeen Cremin
Yass, NSW, Australia

Basic Biographical Information

Bernard Philippe Groslier (1926–86) was the most significant archaeologist of Cambodia in the twentieth century. He was born in Cambodia and lived there half his life. His career was affected by international politics and war, first World War II (1939–1944), then the French Indochina War (1946–1954), and the US Vietnam War (1954–1975) which led into Cambodia's Civil War (1970–1975) and the creation of Democratic Kampuchea (the "Khmer Rouge," 1975–1979).

Bernard Philippe, third and youngest child of a leading French art historian, also born in Cambodia, lived in Phnom Penh till 1939 when he moved with his mother and brother to central France to complete his studies. The University of Strasbourg excavations at the Gaulish site of Gergovie were a recruiting ground for the French Resistance, which Groslier joined in 1942. He enrolled in the (Free) French army in 1944, serving until 1948. He reached Cambodia with the army of General Leclerc in September 1945, to find that his father George had died under torture and that his sister had been interned under the Japanese occupation.

Back in Paris, Groslier studied history, anthropology and Khmer (Cambodian) language and literature. In 1950 he was appointed to the newly created Centre National de la Recherche Scientifique (CNRS) and returned to Indochina. There he was seconded to the French school of Asian Studies, the École Française d'Extrême Orient (EFEO), at a time when it was being split into four to work with the postcolonial states of Cambodia, Laos, North and South Vietnam. Until 1954 Groslier ran the Saigon Museum and a research journal and also carried out important aerial surveys over the Mekong Delta, confirming the existence of an early polity ("Funan," c. first to fifth centuries CE).

Between 1954 and 1958 Groslier travelled widely and worked on excavations, mostly around the Mediterranean, where he learnt more about stratigraphy, materials conservation and ceramics analysis. In 1958 he published an analysis of Angkor city in the fifteenth and sixteenth centuries, based on Portuguese historical records and his own knowledge of monsoonal environments (Groslier 2006). In 1959 he was appointed EFEO Director of Archaeological Research and Conservator (curator) of the Angkor Archaeological Park, which includes remains of at least 250 monuments (ninth to sixteenth centuries CE).

Despite his great knowledge of Cambodia, Groslier failed to read the political mood. Cambodian intellectuals he might have met in Paris as a student were rejecting not only colonialism but also traditional values. In 1966, at the very time when Groslier was lauding the stability of Buddhist Cambodia under King Sihanouk (1922–2012) (Groslier 1998: 83–4), their near-contemporary "Pol Pot" (c.1925–98) was in North Vietnam creating the Cambodian Communist Party, the "Khmer Rouge" whom Sihanouk was eventually forced to support.

During the Civil War, from 1970, Groslier would cycle across army lines to Angkor Wat, where many villagers had taken refuge, as that site is so sacred that neither of the opposing forces would dare to attack it. When he was eventually forbidden to go there, he started work on two Angkorian temples within the government-controlled town of Siem Reap but was forced to leave in 1972, returning to France in 1974. There he oversaw the creation of the Centre for Archaeological Research (CRA) and was starting work on a major book when he died of a heart attack at age 60.

Late in life he publicly reflected on the legacy of colonialism and his own part in it: "*We* started the research. *We* published it. . . . In so doing, we deprived the Khmer of their past, not intentionally, but in practice. It was no longer theirs. And if they wanted to know about it they had to learn

French. How infuriating was that!" (Groslier 1985–86: 26).

Major Accomplishments

Groslier ran the world's largest excavation site, at Angkor, from 1960 to 1970, and made significant statements about that city's land use. As an expert in the conservation of complex monuments he also carried out consultancies for UNESCO and for the governments of Burma (Bagan), Indonesia (Borobudur), Malaysia (Melaka and Bronze Age sites), South Korea (Seogkuram and Haeinsa), and Thailand (Phnom Rung and Bronze/Iron Age sites). For the general public, he published numerous works on southeast Asian archaeology and art (Moore 1989; Condominas 1992).

In his role as Conservator of Angkor Groslier displayed great energy and administrative ability. He had to rebuild the research facilities and create new ones; inventory over 5000 items gathered since 1908, establish a ceramics reference collection and equip laboratories for materials analysis. In the Archaeological Park, the major challenge was to rebuild or consolidate the monuments which had collapsed or were in danger because of shallow foundations. His method was to take the buildings apart, stone by stone and rebuild them over a core of concrete. Brick structures were similarly dismantled and re-applied onto new concrete walls (Groslier 1998: 69–75). The workforce, drawn from local villages, was expanded from 150 to over 900 men and the support staff eventually included 38 French-trained architectural draughtsmen.

Each consolidation was accompanied by excavations, but Groslier also carried out research excavations on nonmonumental sites, such as Angkor's only known cemetery (Sras Srang, eleventh to fourteenth centuries) and on sites outside Angkor proper. These projects enabled him to develop site-specific chronologies. Records and artifact collections were destroyed by the Khmer Rouge, but the information has been partly recovered by new work since the 1990s.

Groslier's main contribution to archaeology in general has been his environmental approach to the life and death of Angkor. From his aerial and ground surveys, he was able to state as early as 1966 that "archaeologically speaking, Angkor is primarily an immense system of hydraulic works: main supply channels, dikes, reservoirs, field runnels all designed to store up fresh water, collect rainwater and redistribute it all to the meticulously planned network of rice-fields below" (Groslier 1966, chapter 2). Over time he would elaborate on this interpretation extending it to include aspects of flood-mitigation, a major concern in Angkor's low-lying plain.

In his final statement on the topic, he argued that the city of Angkor and its suburbs – covering about 1000 km^2 – were overly dependent upon the hydraulic system. When that system collapsed, so did the city: "as long as it functioned the Angkorian system was probably ideal. With the first 'failures', even if they were due to modification in the social order and were thus not 'natural', it became a poisoned gift" (Groslier 2007 [1979]: 176). His dense arguments, based on years of on-site research, created controversy and various criticisms, some more cogent that others, the difficulty being that there was in the 1980s no way to test Groslier's hypothesis. Recent work, using more sophisticated methods, has found that the moat of Angkor Thom city ceased to be maintained after the mid-fourteenth century because 'multiple factors coalesced to encourage the Cambodian elite to relocate closer to the Mekong and Tonle Sap River'. The city was abandoned for reasons which were political and economic rather than environmental (Penny et al. 2019).

Gryaznov, Mikhail P.

Nona A. Avanesova
Department of Archaeology, Samarkand State University, Samarkand, Uzbekistan

Basic Biographical Information

Mikhail Petrovitch Gryaznov (1902–1984) was an outstanding Russian scientist, Doctor of Historical Sciences, Professor, Laureate for the USSR National Award, and corresponding member of the German Archaeological Institute. M.P. Gryaznov entered into the archaeological chronicles of Euroasia as an outstanding specialist in archaeology, anthropology, and the ethnography of Siberia, Kazakhstan, and Middle Asia.

Mikhail Gryaznov made his pathway to archaeology through a untraditional route. While being a first year student in the physics branch of the Physics and Mathematics Department at the University of Tomsk, he participated in the Achinsk geographical expedition. On the banks of the Yenisei River, 17-year-old Gryaznov met an archaeology squad. He stayed there as he was excited by the excavations. From that time onward, Gryaznov's scientific interests were in archaeology, anthropology, and ethnography. Those interests were strongly connected to the discovery of the first four stages of currently well-known cultures by ancient Siberian archaeology: Afanasiev's, Andronov's, Karauk' memorials of Bronze Age, and Scythian Time mounds. In 1922, Mikhail Gryaznov transferred to Leningrad University, and in 1925, upon finishing a 3-year study period in the anthropology branch of the Physics and Mathematics Department, he left the university and started to work as a scientist in the ethnographic department of Russian National Museum.

At the end of 1920, under the guidance of his teacher S.A. Teplouhov, Mikhail Petrovitch Gryaznov's area of interests had become even clearer. During this period, he concentrated his attention on researching the monuments of the Bronze Age in a wide region, including Southern Siberia, Kyrgyzstan, and Kazakhstan.

M.P. Gryaznov's fieldwork on the Scythian period in Altai Mountains holds a very important place in the ancient history of Siberia. During the excavations of large mounds Shibe (1927) and Pazyryk (1929), cultural and art monuments of the "early nomads" were obtained, as they had been preserved in permafrost. In 1939, Gryaznov formulated the definition of the *early nomads period* as a distinctive period in Eurasian history. The definition "early nomads period" entered into specialized literature thanks to him.

In 1937, M.P. Gryaznov started his work at the National Hermitage, and from 1939 to June 1941, he held the position of senior researcher with the Institute of History of Material Culture at the Russian Academy of Sciences in Leningrad. During these years, he finished his study of early nomads and monuments of the Bronze Age. His first book about Pazyryk mound was published in 1937 and was completed as a great handwritten work, later published in shortened form (Great Pazyryk Mound, 1950). In January 1945, M.P. Gryaznov completed his master's thesis on *Bronze Age Burials in West Kazakhstan* and in June of the same year, he was awarded his full doctoral degree in history for his monograph *Pazyryk – Burial of a Tribe Chief in Altai*.

Major Accomplishments

At the same time, Gryaznov studied the shaping and development of Bronze Age and Scythian period cultures in Kazakhstan and Southern Siberia very closely. He devoted a line of his publishing to this topic, which entered the list of specialists' desk books not only in Russia, but also abroad. The top of his scientific heritage is *Southern Siberia* (Gryaznov 1969 and 1970; in *Sudsibiren Archaeologia Mundi* in English, French and German in Stuttgart, Munich, Geneva and Paris) and *Arzhan – Royal Mound of Early Scythian Period* (Gryaznov 1980). Gryaznov received the Laureate of the State Prize of the USSR.

His scientific legacy contains more than 140 published studies. They all have an extraordinary subtlety and accuracy of observation and are of great interest on the subjects of technology and the usage of ancient objects. Scrupulous analysis and deep erudition gave him the opportunity to recreate the lifestyle of ancient tribes in completely innovative ways and with details seemingly unavailable to archaeologists. Those studies were based on the results of first-rate excavations undertaken by Gryaznov himself. Many currently well-known in Commonwealth of Independent States (CIS/Former USSR) archaeologists passed through his field schools. From 1946, Gryaznov supervised archaeological expeditions to Siberia, and from 1955 to 1970, he headed one of the biggest expeditions in Krasnoyarsk (USSR). It can be said without exaggeration that it was due to Gryaznov's study of the archaeological data of southern Siberia that we have the most perfect method of complex study of burial memorials. He often used the correlation method for researching archaeological materials. M.P. Gryaznov was a pioneer in involving new methods to study artifacts, from statistical and multidisciplinary to trasological (*science of traces*, from Franch *la trace* and Greek *λόγος*).

M.P. Gryaznov was an excellent teacher. From 1946, he was giving lectures on Siberian archaeology and trasology in the history faculty at Leningrad University, producing highly qualified archaeologists. The broadness of his scientific mind and his gift for educating united many students and followers from different scientific schools.

Gryaznov always combined his research work with teaching, lecturing, and administration. From 1949, he was the head of office work laboratory, and from 1957, he was in charge of the laboratory of archaeological technology at the Institute of Archaeology at USSR's Academy of Sciences. He was the head of the Middle Asia and Caucasus Sector at Leningrad Department of Institute of Archaeology (at present time Institute of Material Culture in Saint-Petersburg) for 15 years from 1953 to 1968. For the last 10 of these years, he led the Leningrad Section of field research at the Presidium of USSR's Academy of Sciences.

In the archaeological chronicles of Eurasia, M.P. Gryaznov is recognized as an outstanding archaeologist, one of the main specialists of ancient Siberian history and Eurasian steppe cultures.

The Guianas: Pre-Columbian Heritage

Stéphen Rostain
CNRS (French National Center for Scientific Research), UMR 8096 "Archaeology of the Americas", Paris, France
CNRS, Institut Français d'Études Andines, Quito, Ecuador

Introduction

Up to recently, pre-Columbian coastal Guianas were almost always forgotten in any study on the prehistory of Amazonia. In most publications, only the archaeology of the valley of the Amazon was presented, leaving away all the lands north of the Guianas watershed that were completely ignored.

Coastal Guianas are located north of the Guianas watershed line where rivers do not go from north to south toward the Amazon River but flow to the north toward the Atlantic Ocean. This concerns three entire countries that are Guyana, Suriname, and French Guiana and three states that are Delta Amacuro y Bolivar (partially) in Venezuela and Amapá in Brazil (Fig. 1). Remarkable progress and discoveries made these last years in the archaeology of the Guianas have changed the vision on the cultural developments and the role of this territory during pre-Columbian times. Archaeologists are now aware of the importance of the northern part of the lower Amazon, especially the Amapá State, as a crucial cultural cradle, but also of the extraordinary pre-Columbian human developments in the Guianas and particularly along the coast.

Comparing to the Andean societies or even to the cultures of the Pacific coast, many persons believe that there is no prehistoric monument in the Guianas or in Amazonia. It is common to ear that archaeological sites of this region are only constituted of some pottery sherds, few lithic artifacts, and many postholes. However, if it is true that pre-Columbian did not built architecture of stone, they did produce all kind of monumental structures. The most famous are obviously made on rocks or with stone as the petroglyphs, the rock paintings, and the geoglyphs but also the grinder stones that are so frequent on the Guianas. Because the scarcity of stone in the region, pre-Columbian Indigenous also made many earthworks that can be more discrete at a first glance and difficult to see on the ground, so they were unrecognized for a long time. They are raised fields, residential mounds, causeways, canals, and ditched hills.

Finally, it is impossible to ignore one of the main heritages left by pre-Columbian people that is an important part of the vegetational composition. During more than 10,000 years, hunter-gatherers, horticulturalists, and agriculturalist had modified plant species by inbreeding of species, favored plant associations, and created vegetation composition in specific landscapes. An important part of the actual rainforest results from millennia of vegetation manipulation and transformation by the Indigenous.

Key Issues

Pre-Columbian Stone Monuments Heritage

Stone monuments are the most famous pre-Columbian remains known in the Guianas

The Guianas: Pre-Columbian Heritage, Fig. 1 Map of the Guianas indicating the coastal Guianas that extend on five countries. (Drawing Rostain)

The Guianas: Pre-Columbian Heritage, Fig. 2 Drawing of a petroglyph by Morissot in 1886, Middle Orinoco, Venezuela (Morisot 2002)

because of their "artistic" value. Four different types of rock sites can be distinguished: petroglyphs (Fig. 2), rock paintings, geoglyphs, and grinder stones.

Petroglyphs are common through all the Guianas but, because the scarcity of investigations, only some of them are known and studied (Dubelaar 1986; Williams 2003). They are found either inland or on the coast, with a preference in the proximity of water but not systematically and almost always close to a hill (Mazière 2008). Anthropomorphic and zoomorphic figures are very frequent. First ones are often with raised arms and spread legs or just represented by a head with eyes and mouth (Fig. 3). Recognizable animals are snakes, fishes, birds, monkeys, caimans, felines, etc. (Fig. 4). There also are many geometric figures. Techniques of manufacture are varied including incision, grooving, staking, and grinding.

As in other parts of Amazonia, rock paintings are more rare in the Guianas than petroglyphs. They are very common in Venezuela but only few sites are known in the Guianas: one in

The Guianas: Pre-Columbian Heritage, Fig. 3 Petroglyph of the Carapa, near Kourou, central French Guiana. (Photo Rostain)

The Guianas: Pre-Columbian Heritage, Fig. 4 Petroglyph of Pascaud, Cayenne Island, French Guiana. (Photo Rostain)

Suriname and another one in French Guiana. The reason can be the destruction of the paintings by the weather and the acidity.

Various monuments made of stones are recognized in the Guianas (Boomert 1981). They can be erected or lay on the ground according to a certain distribution. The most impressive megalithic groups are the stone alignments found in the savannas of Rupununi in Guyana, Sipaliwini in Suriname, and in Parú and Amapá in Brazil. They are very large stand up slabs, eventually slightly modified by percussion, disposed in line, circle, or in triangle. Megalithic sites on the central coast of Amapá are generally found on hills, which are characterized by large panoramas (Meggers and Evans 1957; Rostain 2011). They can be far, up to 10 km, from the closest rock deposit so it had been a substantial work to bring enormous stone slabs to the site. They consist of vertical granite slabs that are arranged in lines, circles, or triangles (Fig. 5). Recent excavations made in the megalithic site of Rego Grande demonstrated a funerary use but also an astronomic function (Cabral and Saldanha 2009). Alignments of slabs laid on their face are found on the rocky top of granitic inselbergs that are free of vegetation and with open panoramas. The most diverse assemblages are located on the Mitaraka sugarloaves, at the southern boundary between Brazil and French Guiana (Hurault et al. 1963). They can be arranged in line or in such a way to form zoomorphic figures, similar to those of the petroglyphs, that have been interpreted as lizards, turtles, or human beings.

Hundreds of grinder stones have been found in the Guianas. A grinder stone is the remain of the result of the grinding and the polishing of stone tools preforms to make axes, chisels, points, etc. (Fig. 6). They are located along the rivers and small creeks and on the coastal outcrops in French Guiana. These marks can be classified in five types (Rostain 1994). The "cupule" is a small circular cavity. The "cupule with bump" is similar to the first one but it presents a central protuberance. The "almond" is an irregular basin, vaguely oval or rectangular, and not deep. The "ship's hull" is a wide and deep spindle-shaped basin. The "groove" is a deep and straight spindle-shaped cavity, with triangular or rounded profile. Different types of grinder can occur on the same rock outcrop. Sometimes, two types are combined that is mostly one, two, or three grooves inside a ship's hull. This last one was made first and reused after to make the grooves. The four first types result from the shaping and grinding of the sides of the tool and the sharpening of the cutting-edge. The groove is made shaping of the edges (and not by the sharpening as it is often said). Ship's hulls are much more common inland than cupules but they are absent on the

coast that could indicate technical differences. Ship's hulls result from a short up-and-down grinding while cupules and almonds are made by a circular movement.

Pre-Columbian Earthworks Heritage

Pre-Columbian groups were also landscape makers because they built a variety of earthworks, particularly along the Guianas coast (Rostain 2010). They are raised fields, residential and funerary mounds, causeways, canals, and ditched hills.

Raised fields are agricultural small earth mounds with two main functions: to secure a dry location for cultivation in flooding areas and to concentrate fertile material (Fig. 7). Thousands of pre-Columbian raised fields surrounded by ditches are located in the coastal zone of the Guianas. They are mainly attributed to Arauquinoid populations, which occupied a territory of 600 km long between Guyana and French Guyana from CE 650 to 1650. Raised fields are classified on the basis of their size, shape, and topographical location. This last criterion is indicative of differences of adaptation to the hydrographical conditions and to the nature

The Guianas: Pre-Columbian Heritage, Fig. 7 Raised field in a flooded area, Galibi area, eastern Suriname. (Photo Rostain)

of the soil. Four types of raised field are distinguished:

- Ridged fields are found in the three Guianas. They are elongated and narrow, measuring between 1 and 3 m in width, 5–30 m in length, and 30–80 cm in height. They take the shape of the slope between the sandy ridges and the swamp. Their distribution can be related to the altitude and the water level. At the foot of the Quaternary sand ridges, elongated raised fields are positioned in the direction of the slope to allow for easy drainage. Near the top of the sand ridges, the ridged fields are arranged perpendicular to the slope for optimal water retention.
- Large raised fields range in size from 2 to 5 m diameter and from 30 to 100 cm height. These raised fields are rounded-off rectangular to square (Fig. 8). Their size ranges from 3 to 4 m wide, 4–30 m long, and 50–100 cm high. These large raised fields are located in the most flooded areas and their sizes are smaller in the deepest swamps.
- Medium-sized raised fields are round, square, or rectangular. Their size ranges from 1.5 to 3 m diameter and 20–30 cm high. They occur in large clusters.
- Small, rounded raised fields range in size from 50 to 100 cm diameter and in height from 20 to 50 cm. They cover the entire surface of the seasonally flooded savannas, which become completely dry in August.

Along the French Guiana coast, raised fields generally are arranged in rough squares and, often, the largest are located in the deepest and wettest areas. Raised fields were built and disposed according to the differences of water level during the two annual seasons. In fact, water is the main physical constraint. The location of raised fields between the high and low areas suggests a precise selection by the Indigenous. However, this was not always enough to prevent drowning of the raised fields. For that reason, it was necessary to surround some groups of raised fields by a belt ditch. In some cases, the checkerboard distribution of the ridged fields also reflects the need to control the water level.

In some areas, the whole surface of the lower area is covered by raised fields, and in other areas, only the edge of the sandy ridges has raised fields. Six main categories of organization and types of raised fields can be distinguished from west to east in the Guianas coast. In eastern Guyana, elongated raised fields are distributed perpendicularly to a

The Guianas: Pre-Columbian Heritage, Fig. 8 Raised fields along slope of sand bars, Karouabo area, central French Guiana. (Photo Rostain)

river. In western Suriname, complexes are made of small groups of elongated raised fields. In eastern Suriname, up to the Mana River in French Guiana, parallel and ridged fields are in flooded depressions. Between the Iracoubo and Sinnamary rivers, savannas are covered by a large number of rounded medium-sized raised fields. Between the Sinnamary and Kourou rivers, rounded or square raised fields associated with ridged fields are located in the savannas and along the edge of the sandy ridges. Between the Kourou River and Cayenne Island, rounded or square raised fields cover the savannas like the area between the Iracoubo and Sinnamary rivers. These variations can represent cultural, chronological, or technical differences.

Artificial residential/funerary mounds are associated with raised-field complexes in various countries of South America like in the Llanos of Apure, in Venezuela, where several Arauquinoid mounds and raised fields have been found. Between the Berbice River in Guyana and the Coppename River in Suriname, sandy ridges are absent, so local people had to build rounded clay mounds above the water level to erect their villages. At least, nine mounds were erected on a landscape where fresh, brackish, and salt waters met, but other possible artificial mounds have been reported in this area. c. CE 300, a Barrancoid group raised two mounds. From CE 650, Arauquinoid communities built progressively layer-by-layer new mounds that they occupied up to CE 1250. Their territory extended to cover a region some 210 km long and 25 km wide.

Hertenrits is the largest of the mounds, with a raised area estimated at 4 ha (Fig. 9). It measures 200–320 m in diameter and 2.5 m high. The area around the mounds was inundated with freshwater at the end of the wet season. Humans modified some water lines to connect them or to improve natural drainage. A ditch of 20–100 m wide surrounds the Hertenrits mound. Five wharves of 20 m long and at least 1 m deep are disposed on the periphery to receive canoes. Two smaller satellite mounds were built diametrically opposite, equidistant from Hertenrits: Wageningen-1 is 4 km to the east and Wageningen-3 is 3 km to the west. Shallow seasonally inundated canals run radially, connecting the Hertenrits mound to raised fields and to the two other mounds. These canals were used as pathways during the dry season and as waterways during the rainy season, strongly suggesting that the three mounds were occupied at the same time. The inhabitants of Hertenrits organized and managed their territory in a precise and specific manner.

It is important to note here that long before, other pre-Columbian people have developed other solutions to inhabit flooded zones. Between 6800

The Guianas: Pre-Columbian Heritage, Fig. 9 Hertenrits artificial clay mound, Arauquinoid culture (CE 650–1250), western Suriname. (Photo Geisjkes c. 1950)

and 3550 BP (Williams 1992), the fisher-gatherers of the Alaska culture, in western Guyana, raised the floors of their settlements to live close to the shore (Fig. 10). They set aside the shells of marine resources they consumed, gradually forming enormous mounds above the flood level. These *sambaquís* are evidence of the importance of marine shellfish for these populations, who appear to have been attracted by richness of the fauna and flora.

Causeways are frequent near Arauquinoid sites of the Llanos de Apure in Venezuela, but not so common in the Guianas. Some raised pathways have been found in Suriname and French Guiana. They are oriented in a north–south direction and they generally cut through the swamps, connecting two west–east sand ridges or one sand ridge to the shore. They can reach up to 600 m long and 8 m wide.

Ditches made by pre-Columbian groups are difficult to recognize because, after several centuries, alluvium and vegetation tend to obliterate them. Moreover, Creole farmers had also made small canals during the twentieth century, which might be confused with pre-Columbian ones. Stereoscopic interpretation of aerial photographs also shows that there are numerous water lines, which do not follow the natural flow and must have been made by people. Ditches were made to improve water control. Small and curved waterlines perpendicular to the direction of the natural water flow enclose groups of raised fields. They are relatively narrow at their extremities and

The Guianas: Pre-Columbian Heritage, Fig. 10 Waramuri shell mound during the excavation in the nineteenth century, western Guyana (Brett 1868: 430)

generally form a pond at the center. These ditches prevented too much water near the raised fields during the rainy season. They also most likely served as water reserves during the dry season. Straight and regular canals were used for the drainage of excessive water and, perhaps, as water tanks or fishponds. They often connect archaeological settlements on sand ridge and raised-field complexes. Some of them are exceptionally long and could serve for canoe travel through the flooded savannas. Ponds were sometimes dug near a sand ridge or in the middle of a swamp. They are generally rounded or irregular. It is probable that they were used as water tanks and fishponds.

During the first millennium CE, specific sites locally named "montagnes couronnées" (literally "crowned hills") appeared in French Guiana, northern Amapá in Brazil, and eastern Suriname. They can be made by trenches surrounding the top of a hill or ditches closing a spur on a riverbank. They are linear, oval, or round with a diameter between 100 and 300 m. Ditches measure 5–15 m wide and 1–3 m deep. Some entrances can be made by embankment through the ditch. Few pottery sherds, very eroded and not decorated, are generally found in these sites. Most of the sites are dated between the first centuries of our era and the thirteenth century (Mazière 1997; Versteeg 2003). Fortification purposes or ceremonial function have been ascribed to these sites.

Future Directions

Guianas are not the favorite spot for tourism so little attention has been given to pre-Columbian remains. Although archaeology still is relatively incipient in the Guianas because scientific programs have been conducted only for 30 years, it is already possible to draw up a panorama of the pre-Columbian occupation of this huge region (Rostain 2008). For the last decade, Guianas has known a remarkable increase in archaeological investigation, especially by the realization of large projects. On the contrary, very few actions have been carried out to preserve archaeological heritage. Governmental institutions are missing or have neither power, nor fund, to protect this patrimony. Even a simple inventory of stone monuments and earthworks as it is presented in this entry has never been done at the scale of the five Guianas because of patrimony politics and investigations were very nationalistic without consultation with neighbors. There is also no real desire to promote Indigenous past in these countries that prefer to put a slant on historical remains. The result is that pre-Columbian heritage is gradually destroyed by neglecting and vandalism.

To finish, there is a curious phenomenon acting on the preservation of certain archaeological remains. Leaf-cutter ants (*Atta* species) are generally considered as one of the main plagues for rainforest agriculture. These voracious insects are a nuisance for humans because they defoliate crops and destroy plantations. However, the same ant also permits the preservation of raised fields. Ants act as "central place foragers" and as "mound builders" (McKey et al. 2010). They construct deep nests, bringing subsoil to raised-field surfaces. Ants move materials to the raised fields where they set their nest. *Acromyrmex* workers carry large quantities of plants to the nest to feed their fungal symbiont. Moreover, transport of material to surface of abandoned raised fields thus at least partially compensates losses due to erosion and maintains the mound height. By reducing the erodibility of raised fields and by transporting materials to them, thereby compensating erosional losses, communities of ecosystem engineers on raised fields maintain the concentration of resources (and organisms) on raised fields and their depletion in the surrounding matrix. In conclusion, ecosystem engineers are responsible for the preservation of pre-Columbian raised fields up to nowadays. They are ants, earthworms, termites, and even plants. Each of them played a function more or less important.

It is noteworthy to outline that after their abandonment by human social mammals, raised fields were managed and preserved by natural social insects. In the Guianas, Nature tends to preserve Culture.

Guinea Pig: Domestication

Silvana Rosenfeld
Department of Sociology and Anthropology,
High Point University, North Carolina,
High Point, NC, USA

Guinea pigs (*Cavia porcellus*, Linneaus 1758; Rodentia, Caviidae) were the only small mammals domesticated in the Americas. The other New Word animal domesticates were turkeys (*Meleagris gallopavo*), llamas (*Lama glama*), alpacas (*Lama pacos*), and Muscovy ducks (*Cairina moschata*).

Guinea pigs are small Andean rodents that still function as a delicacy food (Fig. 1), as an

instrument to diagnose disease, and as key component in sacrificial offerings in traditional communities. In indigenous Quechua they are referred as *jaca* or *saca*, and in Ayamara the word is *wanku*. However, most people in the central Andes call them *cuis domestico*. Other known terms in South America are cuis domestico, *cobayo* and *conejillo de Indias.*

As part of the family Caviidae, guinea pigs present a particular dental formula: teeth cheeks are ever growing and have two enamel prisms with sharp folds and angular projections. They have four toes on the front feet and three on the hind feet, and the tail is extremely reduced. The adult guinea pig weights approximately 750 g and is on average 30 cm long. The most common colors are white, brown, and gray. Their life span is 5–7 years. Puberty occurs at roughly 70 days of age. The gestation period is generally 10–12 weeks, and litters are usually composed of two to four pups. A few days after birth, young *cuys* are able to care for themselves. Fertilization takes places again shortly after a female produces a litter. Pups or pregnant *cuys* do not need a special human care. In Andean communities, they are generally kept inside the kitchen (Fig. 2), and they are fed with alfalfa and table waste such as potato peelings, grass, fresh corncobs, and grains (Bolton 1979).

Guinea Pig: Domestication, Fig. 1 Fried guinea pig dish as served in a restaurant in Ayacucho, Peru

Wild *cuys* were surely attracted to human refuse in caves or other early settlements. People realized they were a good source of meat and probably encouraged wild *cuys* to stay around the house by giving them food scrapes. They were eventually brought into the kitchen areas where they received warmth, food, and protection until when, finally accustomed, they started reproducing in captivity (Gade 1967).

Given their small size in comparison to the Andean camelids, the domestication of guinea pigs does not seem to be primarily related to increases in their meat productivity. They do not provide secondary products such as milk, leather, or wool. Yet

Guinea Pig: Domestication, Fig. 2 Guinea pigs kept in a kitchen, Ayacucho, Peru

cuy manure is a rich fertilizer. It is collected to nourish orchards and cornfields in the Andes. Manure may have also been used as fuel, although it would have been needed in large quantities.

A cultural ecological analysis has been used to explain the successful introduction of guinea pigs in the Andean diet as environmentally determined. Data recorded in Cuzco (Peru) shows that *cuys* are primarily eaten during Christmas, Carnival, Easter, and Corpus Christi (Bolton 1979). It has been claimed that major communal *fiestas* in rural Andean Peru serve guinea pigs to distribute proteins during the wet season, November through April, the time of greatest protein need in Southern Peru (Bolton 1979). However, this explanation does not take into account other sources of protein common in rural Peru today, namely, the introduced chicken and pigs and the native camelids. Furthermore, this explanation does not consider the need for fat and carbohydrates in the Andean human diet.

Another explanation for the domestication and incorporation of guinea pigs in the pre-Columbian Andean diet is the fact that they represent an additional source of fat, especially during the wet season when carbohydrates and grain proteins were short in supply (Rosenfeld 2008). Guinea pig meat is 7.8% fat, as a weight-based proportion of the edible meat. This is not a high-fat value, but it could have been crucial as an additional source to that of camelids, particularly during certain times of the year and especially to the most needy segment of the human population (infants, pregnant, and nursing women). When carbohydrates are not abundant, humans must switch to animal fat as an energy source and/or synthesize energy from protein. Therefore, when carbohydrates were in short supply during the wet season of the Andes, guinea pigs could have provided the fat needed to help metabolize animal protein in order to have a balanced diet (Rosenfeld 2008).

Two wild ancestors of the domestic guinea pig have been suggested: *Cavia tschudii* and *Cavia aperea*. The distribution of both wild species extends from Colombia to Argentina, though while *C. tschudii* inhabits high-altitude environments, *C. aperea* inhabits the eastern lowlands. Both *Cavia* species would have been a good candidate for domestication as they have high birth rates, eat household refuse, and can easily be raised in captivity: important elements of preadaptation to domestication. Both species produce fertile hybrids when crossed with *C. porcellus* (Gade 1967). However, skull morphology (Wing 1977) and molecular analyses of the complete cytochrome b gene sequences (Spotorno et al. 2004) and 12S sequence (Sportorno et al. 2007) suggest that the wild species *C. tschudii* from western South America, and not *C. aperea*, is the ancestor of the domesticated species, *C. porcellus*. The available data points to the western central Andes as the probable place of original domestication of the guinea pigs.

At sites like Ayamachay and Puente in the Peruvian Andes, the association between man and wild *Cavia* dates back as far as 10,000 years before present (Wing 1977). Changes from selection for large size were noted by measuring the height of the jaw in the middle of the diastema. Archaeological samples from Ayacucho and Cuzco show that the most recent samples are the most variable; the mean of the diastema measurement shows a large and significant increase in size over older samples. These changes are seen by 3000 B.P. at the Pikimachay cave in the Ayacucho Valley (Wing 1977). While domestic guinea pigs preceded Inca occupation in Southern Peru, Northern Chile, and Ecuador (Sportorno et al. 2007; Stahl 2003), their presence in northwest Argentina appeared to be due to the Inca occupation in the fifteenth century (Rodriguez Loredo 1997–1998). Finally, recent analysis suggests that domestic guinea pigs were introduced in the Caribbean region as early as AD 600 (Kimura et al. 2016; LeFebvre and deFrance 2014).

Gwion Gwion

Graeme K. Ward
Australian Institute of Aboriginal and Torres Strait Islander Studies, Canberra, ACT, Australia

Introduction and Definition

Gwion as Ancestors and Images

The term "Gwion" refers to a type of figurative pictogram found in northwestern Australia, especially the sandstone of the Kimberley Plateau. Typically, but not exclusively, the form of the paintings appears to be elegant "humans"; they are depicted in various poses, and appear to be wearing "wigs" and carrying items in their "hands" or attached to their "bodies" (Fig. 1). Often the figures are grouped in apparent scenes; both as single figures and in groups, the stance and orientation of many is suggestive of dance or ceremonial activity. Typically, the depiction is of small, slender figures, outlined and in-filled profiles, whose finely executed painting was achieved by delicate brush-work. Gwion figures are usually a wine red, a hue that has been described as "cherry" or "mulberry-colored." Their subject matter and method of execution may be contrasted with those of the much larger, more boldly wrought Wanjina figures; the distributions of the two overlap. Not dissimilar figures are found to the northeast in the Keep River and Fitzmaurice River regions, and it has been suggested that they are related to the Mimi figures of Arnhem Land, and that in the ancient past, there was a shared cultural area joined by the extensive coastal plain of northwestern and northern Australia that is now a shallow sea.

The region includes the traditional lands of the Ngarinyin; adjacent languages groups are the Wunambul and the Worora. The Ngarinyin term for the figures is "Gwion Gwion," sometimes written "Guyon" or "Kwion"; the Wunambul and Worora use linguistically similar descriptors (Ngarinyin are the largest language group). Some commentators have seen the Gwion as "mysterious" and even as having been produced by non-Aboriginal cultures or even "alien beings." Such a "mystery" if it ever existed has been "solved" by research conducted in collaboration with four senior Ngarinyin traditional owners, *munnumburra* (initiated men, "lawmen"). The verbal testimony of the Pathway Project was recorded on-site in painted shelters and published in an illustrated book entitled *Gwion Gwion: Dulwan Mamaa. Secret and Sacred Pathways of the Ngarinyin Aboriginal People of Australia* (Ngarjno et al. 2000: 14).

Essentially, Gwion are (depictions of) ancestral beings and are treated with great respect; they are not spoken of lightly. It needs to be recalled that people were frightened of ancestors, who were

G

Gwion Gwion, Fig. 1 "Inventors": Yandama site. The named Gwion personage, "Yandama," the inventor of the spear-thrower, is depicted at *left*; his body is delineated with stripes and his feet end in three digits – a reference to his avian clan. He is depicted wearing a feathered head-dress, and in his right hand (as seen from the viewer's perspective) he holds the hooked throwing-stick (*nyarndu*) of which he is the historic inventor. About his waist height, his spear is depicted horizontally to the *right*; it is shown having pieced the upper body of the kangaroo depicted on the *right* of the panel; the spear is shown with multiple, sharpened wooden barbs – used before hide-penetrating *gimbu* points were manufactured. Scale: central figure c. 150 mm. (Photograph: Pathway Project 1994 PP1309∗08 [130908])

powerful enough to hurt or to kill them (e.g., Ngarjno et al. 2000: 27, 83); they exercised great caution in approaching the painted images (e.g., Ngarjno et al. 2000: 38). They were secretive about them, to the extent that some commentators thought and regrettably still publish that the local people knew nothing of them. It is evident, however, that the Gwion are an integral part of the cosmology and social history of the Ngarinyin and others, and that they are part of their continuing cultural heritage has been recognized formally by granting of native title rights.

"Gwion" is both the term for the original humans born from the "Great Mother Jillinya" and who inhabited a land without boundaries (Ngarjno et al. 2000: 36), and, secondly, the corpus of painted images created by the ancestors. The subject of the Gwion paintings is "law." Gwion were inventors of hunting technology – of stone tools, spears, and woomera (Ngarjno et al. 2000: 85, 93, 209, 232); *Munga.nunga* is a term for the same artists as visionaries – law-makers and story-tellers (Ngarjno et al. 2000: 128); and *Jenagi Jenagi* for them as messengers (Ngarjno et al. 2000: 176), who are depicted carrying messages relating to the laws of the *Wunan* council across the extensive *dambun* regions and further afield, to the Dampier Archipelago and

Gwion Gwion, Fig. 2 "Visionaries": Galeru.ngarri North site. The Gwion figure on the *left* is depicted passing a sacred object to the first of a series of other figures; the image depicts the distribution of the Wunan Law through cultural exchange. Note dense silica skin covering part of imagery at *lower left*. Scale: central figure c. 110 mm. (Photograph: Pathway Project 1999 PP0059∗02 [005902])

Arnhem Land (Ngarjno et al. 2000: 174) (Fig. 2). While Gwion are the first skilled painters of the human form, it is important not to consider Gwion images as an art form, as entertainment, but as legal documents. Depictions of Gwion express the complex *Wunan* system of law and exchange that the Gwion invented and that originated with the actions of two Gwion heroes named Wodoi and Jungun, seekers of wisdom and knowledge (Ngarjno et al. 2000: 192–204). They inform the senior members of the community, especially the *munnumburra*, and might serve for instruction of younger generations (Ngarjno et al. 2000: 310–6) (Fig. 3).

Gwion images are painted with skill and often with some anatomical realism but also with bird characteristics including pairs of wings (Ngarjno et al. 2000: 126–7). Frequently, images appear to depict persons wearing or holding unfamiliar objects; but these items are extensions of the persons depicted, as if they are growths from the knee, elbow, hand, or shoulder – they are extensions of the personage, making emblematic connections with the landscape of the clan ancestors (Fig. 4). In these conceptualizations, every painted place has its own specific body and *mudurra* (headdress) extensions (Figs. 5 and 6), and refers to the various totems, to plants, animals, and especially to birds.

The term "Gwion" invokes the story of the cave-dwelling Gwion Gwion bird, which used his beak to wipe blood across the surface of stone and thus was responsible for the first paintings copied by humans (Ngarjno et al. 2000: 118–20). The color of the Gwion paintings derives from the wine-red sap of the *mamandu*, a mulberry-like bush that is commonly found near painted shelters. The liquid sap was extracted into shallow cup-shaped depressions in the stone – "cupules" (*norgun* in Ngarinyin) (Fig. 7) – that usually are found on the floor near shelter entrances, like painters' palettes (Ngarjno et al. 2000: 99–100, 123). (The Ngarinyin say that the original Gwion artists were clever because this sap gave them a fixative as well as red color!) Some images, despite being exposed to sun and rain, are vivid, contrasting with the surrounding rock face. Unlike the Wanjina, they were not regularly over-painted, although if damaged, might be repaired, restored to maintain the integrity of the image (for example, in the case of exfoliation of a painted surface: the ring dance imagery: Ngarjno et al. 2000: 209, 232), and many painted areas show a great complexity of superimposition. Researchers have observed that there is no residual pigment in Gwion paintings, but the images remain visible. Pettigrew et al. (2010) have written that the original paint ". . . has been replaced by a biofilm of living, pigmented microorganisms whose natural replenishment may account for [their] longevity and vividness . . .". The cherry to dark purple colors of the image was determined by the proportions of black pigmented fungus and red Cyanobacteria. It is

G

Gwion Gwion, Fig. 3 "Visionaries": Guringe site, a women's place within the Anaut.ngarri territorial division of the Wunan. This scene depicts a public meeting-dance (*birrina*); here a distinction is made between male and female Gwion figures. The central (*dark*) Gwion figure depicts a female dancing as a praying mantis among women who are depicted to each side; the scene signifies acceptance of the male figure depicted at *left*. Females wear *mambi* (a triangular skirt not in daily use; turned to back for dancing; cf. *jalgun*). Guringe is an important women's site of the Great Mother, a sanctuary established prior to the Wunan laws that were developed by males. The panel is many-layered and of considerable complexity. Scale: central figure c. 180 mm; note that the figures are small, and necessarily very finely painted, perhaps with feather "brushes" and probably by women. (Photograph: Pathway Project 1997 PP1711∗23 [171123])

likely that the organic character of the original paint provided the basis for the development of the biofilm.

Key Issues/Current Debates/Future Directions/Examples

Origins and Ownerships

A colonial settler, Joseph Bradshaw, exploring the Prince Regents River region of the Kimberley in 1891 provided the first known European recordings of the distinctive Gwion imagery; while he recognized them as "native paintings," he wrote that standing in front of them was like viewing ancient Egyptian temple walls. Later, in ignorance of the significance of these images to indigenous peoples, his name was used for these figures, and his casual comparison of the rockshelter to a southwest Asian locus appears to have supported ideas of "alien origins" for the motifs.

Since then, there has been some debate about the source of the Gwion images. Ignorance of their cultural significance encouraged speculation contextualized by the history of nineteenth and twentieth century colonial settlement of the continent and concomitant racism in which the autochthonous occupation was seen in terms of hyper-diffusionism, "primitive peoples," and "advanced civilizations." The "non-Aboriginal origin" argument sat within a pervading colonial discourse; if the elegant and sophisticated Gwion figures were "aesthetically superior" to other Aboriginal paintings, how could they have been made by uninventive "savages," by a "primitive culture"? They must have been painted by another race.

Gwion Gwion, Fig. 4 "Messengers": King Edward River site. This scene depicts a ceremonial dance with *walbud* (marsupial hide aprons) removed and holding *mandi* (crescent-shaped ceremonial boomerangs). "In the early days, there were three nations. When they came together to dance, one brother stole another brother's wife; so he hit him with a *mandi*. After that they all turned into different types of birds". – *Munnumburra* Paddy Neowarra 28 August 2012. Scale 100 mm; these figures are small and finely depicted. (Photograph: GK Ward 1999 (AW09-24) [AW09-24 24Jun99 KEdwardR site2 7 val Gwion Bcc])

Gwion Gwion, Fig. 5 "Messengers": King Edward River site. This scene depicts a group of women wearing conspicuous *mudurra* (sculptured headdresses). "This is a painting of a special women's dance. The women would go to a sacred place where they would teach the young women how to dance. It was a sacred women's place and men could not go there". – *Munnumburra* Paddy Neowarra 28 August 2012. Scale 100 mm; these figures are among the largest depictions of Gwion figures. (Photograph: GK Ward 1999 (AW09-18) [AW09-18 24Jun99 KEdwardR site2 Gwion x4 Bcc])

Gwion Gwion, Fig. 6 "Messengers": Donkey Creek site. Here a couple is depicted; a female (on *right*) is shown with long skirt, elbow, and other ornaments. Scale 100 mm; these figures are also large but finely delineated. (Photograph: GK Ward 1999 (AW08-30) [AW08-30 24Jun99 Donkey Creek Gwion Bcc])

Gwion Gwion, Fig. 7 *norgun* (concave palette) with typical staining from *mamandu* bark – (recent) red around lip and (transformed) black within *norgun*. Scale: width of opening c. 140 mm. (Photograph: Pathway Project 1995 PP1318∗13 [PP-Wulungarri-53norgun])

There had been nineteenth century speculations about earlier, non-Aboriginal, occupants of Australia – some prompted by apparent denials by traditional owners of knowledge of the origin and meaning of rock art images; indeed, some similar suggestions were made by twentieth century anthropologists – so it was perhaps not surprising that an "exotic" origin became a convenient if naïve explanation of the Gwion images. Few commentators apparently had read in Bradshaw's account – in the paragraphs immediately preceding his descriptions of the paintings – of a large group of men encountered by his party in the same area; many were painted and some wore large headdresses – which description sounds not too dissimilar to the painted images that he had recorded.

The debate regarding the "origins" of the Gwion images became one of "ownership" contextualized again by the concerns of the late twentieth century. The claims of a "mystery race" had implications for indigenous land rights, and attempts to deny indigenous peoples, authenticity and legitimacy were pursued by various elements of the popular media. Despite informed comments from and rebuttals by researchers, the popular misconceptions about the Gwion continue; a researcher who has been following the debate considers that informed responses have been ineffective, and suggests that it is necessary for archaeologists and indigenous people to combine efforts to provide more proactive mass-media engagement (McNiven 2011).

In 1992, Banggal (David Mowaljarlai), one of the Ngarinyin *munnumburra*, initiated a recording project in conjunction with ethnographer and film-maker, Jeff Doring. Their intention was to regain ownership of the Gwion by revealing previously secret aspects of their culture. Their collaboration resulted in a book (Ngarjno et al. 2000), symposia, and exhibitions of film in France and Australia, and explicit public statements: At the 1998 meeting of the Australian Rock Art Research Association, they spoke of their knowledge of the Gwion imagery and called for the Gwion figures to be known by their correct name.

In August 2004, the Wanjina-Wunggurr Community gained Native Title rights over their

traditional lands (Neowarra v State of Western Australia [2004] FCA 1092), including the painted imagery. The Ngarinyin research and recording including the published accounts were significant in achieving the native title determination.

Dating

Dating of the Gwion figures has been the subject of much research and considerably more debate. The Ngarinyin and other traditional owners in the region consider Gwion to be part of their cultural landscape, both long-standing and contemporary. The claims by some of an early age based on identification of a non-Aboriginal origin (above), rejected by traditional owners and the Federal Court, nevertheless have inspired the popular imagination and much ill-informed commentary. Part of this was based on the mistaken identification of the Gwion as "rubbish" pictures, a term that may be used to refer to old matter (Redmond 2002: 58) or that is sometimes used when one wishes to avoid discussion of a matter – particularly given the possible severe sanctions (above).

Subsequent research into the dating of the Gwion figures has produced questionable results. Claims of Pleistocene age are reinforced by identification of depicted megafauna known to have been extinct millennia ago, by excavation of ochre-stained rock panels, and by the results of optically stimulated luminescence (OSL) applied to quartz grains from mud-wasp nests seen to overlie rock paintings. An admirable review of the various methods of archaeological and chronometric methods and results from the Kimberley recently has been made by Aubert (2012). Aubert suggested that the possible identification of examples of extinct fauna (mostly extinct during the Pleistocene) should be treated as stimuli for further investigation rather than as conclusive. The identification (using elemental analysis) of ochre on a limestone slab excavated from the Carpenters Gap (Napier Range) site and dated to about 40,000 years ago could not be regarded as conclusive because of the possibility of a natural source of staining, and lack of clear figurative intent: "... a robust interpretation of Pleistocene rock art would require a recognisable motif as ochre was not exclusively used to produce rock art" (2012: 574).

Accelerator mass spectrometry (AMS) radiocarbon analysis has been used to date various materials enveloping rock art pigments in Kimberley sites (Aubert 2012: 574–5). Determinations made on debris contained within beeswax deposited over paintings typically range from modern to less than 4,000 years BP; those made using charcoal suggest that Wanjina motifs were painted – or repainted – relatively recently (dates range from modern to about 1,200 years BP). AMS dating of oxalate salts layered with paint pigments at the Carpenters Gap site produced results dating two examples of Gwion figures to between three and four thousand years BP, and results using silica skins indicated that another two Gwion figure types had minimum ages of about 1,500 years.

The most often quoted age determination for a possible Gwion figure is that of about 17,000 BP obtained from application of the OSL technique to dating quartz grains from mud-wasp nests. Aubert's review (2012: 575–6) of the results questioned whether the dated nest was actually overlying the painting, and whether application of the technique should be restricted to large nests where quartz grains could be extracted from the nest core where gains are protected from modern sunlight: whether "... the Kimberley has Pleistocene aged rock art remains debatable and requires additional dated motifs".

Aubert (2012: 576) considers that high-resolution uranium-series dating methods could be applied to the natural calcite and silica laminations that have been identified as enveloping rock paintings in the Kimberley and could be used to provide estimates of maximum and minimum ages; there are further such techniques applicable to age analysis of other natural surfaces that so far have not been applied to rock art.

Considering the range of non-figurative and figurative pictogram motifs recorded in the Kimberley region, the complexity of the superimposition sequences at many sites, the putative depiction of some fauna known to have become extinct during the Pleistocene, and the presence of

various biogeological factors enhancing the preservation of painted surfaces, it would perhaps be surprising that a rock art of Pleistocene age was not present in the Kimberley. This likelihood should not, however, mean that the painting tradition that includes the Gwion figures be considered to be exclusively ancient; not only are there AMS determinations establishing that Gwion figure painting was done in the last 4,000 years, but also the strong and formally recognized claims of the Ngarinyin that the Gwion are part of their continuing cultural tradition of *Wunan* Law. The last aspect is emphasized by the cinematographic record made by Jeff Doring in 1999 of Nyawarra (Paddy Neowarra) spontaneously painting a sentinel Gwion at the Garimbu Creek shelter, at the junction of three *dambun* districts, using charcoal mixed with water and a sap fixative (Ngarjno et al. 2000: 120–1) (Fig. 8); the sequence was included in the ACMI series of films shown throughout 2002 and discussed at an international congress in 2004 (Neowarra et al. 2004). The Ngarinyin recognize periodicity in the imagery and relate this to their cultural history. The earlier motifs, as well as being less expertly painted, tend to depict figures with three digits (e.g., Ngarjno et al. 2000: 292–3), a reference to the legacy of birds in the time of unrestricted wandering; this is followed by the time of the inventors in which the importance of the *gimbu* and woomera is emphasized; later, following the agreement at the stone table at Dududu.ngarri (Ngarjno et al. 2000: 141–7, 164) to divide the country and to control access to one another's *dambun*, to institute moiety kinship relationships, and to follow the *Wunan* law, the images of the messengers carrying the *maya.ngarri* and various Wunan ceremonies prevail. In this context, the chronometric results are not so important, but perhaps they will serve to confirm the longevity of the Wunan and the distinctive Gwion images.

Gwion Gwion, Fig. 8 "Messengers": Garimbu Creek site. Paddy Neowarra painting sentinel figure in 1999. The figure marks the location of the Wunan cultural exchange route connecting three territorial boundaries in Wunan Law. Scale: sentinel figure c. 600 mm high. (Photograph: Pathway Project 1999 [JDC297brush03])

Glossary

(After Ngarjno et al. 2000: 322–5)

birrina	"Coming together" dance linking men and women in public event
dambun	Clan regions allocated by the first Kamali council when originating law . . .; pattern of land titles inherited by Ngarinyin that defines the network of exchange with their neighbors
Dududu.ngarri	Place near the location of the stone table
gimbu	Reddish-brown stone; raw material for the sharpest spear-points invented by the Gwion; circumcision and cicatrise scalpel
jalgun	A small skirt of hide or string fiber worn by women
Jenagi *Jenagi*	Another title for the Gwion artists; literally the "wanderers" or nomads who became messengers of law; "messengers" who began the exchange of sacred *maya.ngarri*
mamandu	Sticky red sap of rough-barked mulberry-like tree; provides fixative and dye used to paint and stain many indelible Gwion figures onto rock surfaces

mambi	Triangular girdle skirt worn by women in Gwion paintings; mother's ceremonial skirt inherited by daughter
mandi	Crescent-shaped boomerang; pairs are clapped together for keeping the rhythm of songs
Munga. nunga	Gwion title for ancestors acknowledged as visionaries and originators of Wunan law . . .
maya. ngarri	Messages through sacred objects; secret or private forms of incised and painted boards preserving primary cultural concepts; abstracted law symbols circulated as messages of law . . .
mudurra	Sculptured wig or headdress of various shapes and sizes recorded in Gwion painting . . .
norgun	Concave palette worn into stone, used for extraction of red liquid from *mamandu* bark
nyarndu	Hooked sick used as a spear-thrower . . .
walbud	Tri-pointed belt-girdle of marsupial hide worn by Gwion males
Wunan	The sharing Law; ancient agreements that ended nomadism by fixing family *dumbun* estates and by establishing moiety divisions of society into two cross-marriage groups. . .

H

Haakanson, Jr., Sven David

Amy F. Steffian
Alutiiq Museum and Archaeological Repository, Kodiak, AK, USA

Biographical Information

Sven Haakanson, Jr., is an Alaska Native archaeologist, museum professional, and artist. He was born in Kodiak and grew up in the native village of Old Harbor, which is a rural fishing community on Alaska's Kodiak Island. After earning his high school diploma from Anchorage's Bartlett High School (1985), he attended the University of Alaska Fairbanks (1985–1992). Here he studied English and education and discovered anthropology in classes with his mentor Dr. Lydia Black. A year teaching English in Magadan helped him develop fluency in Russian. Volunteering on archaeological projects in the Kodiak Archipelago fed his interests in history, technology, and native arts.

In 1988, Haakanson attended the sixth Inuit Studies Conference in Copenhagen, an opportunity that shaped his career. Listening to Dr. Black speak about his ancestral culture on the opposite side of the globe motivated Haakanson to continue his studies. In the fall of 1992, he entered Harvard University's graduate program in anthropology. During graduate school, he taught at Vermont's Center for Northern Studies (1995) and joined archaeological surveys in Siberia led by Smithsonian archaeologist Dr. William Fitzhugh (1994–1997). Working with Fitzhugh led to 2 years of his own fieldwork with the Nenets reindeer herders in the Yamal Peninsula, Russia (1996–1997), and a doctoral dissertation on the ethnoarchaeology of Nenets settlement patterns (Haakanson 2000, 2001). It was the first study of its kind in Siberia.

After completing his PhD, Haakanson returned to Kodiak to lead the newly established Alutiiq Museum and Archaeological Repository, a tribal heritage center dedicated to preserving and sharing the culture of the Alutiiq people. At the museum, he worked to reawaken Alutiiq traditions through research and educational programs that connected people to collections. In 2007, he received a MacArthur Foundation fellowship. In 2013, Haakanson accepted a joint appointment to the University of Washington's Burke Museum and Department of Anthropology. He earned tenure in 2015.

Haakanson's service to cultural and scientific organizations has included appointments to the Alaska State Council for the Arts, Alaska Humanities Forum, Alaska Native Science Commission, First Alaskans Institute, Museums Alaska, Alaska Native Heritage Center, Polar Research Board, and Western Museums Association.

Major Accomplishments

Haakanson's professional life developed in the decade following the passage of NAGPRA, at a

© Springer Nature Switzerland AG 2020
C. Smith (ed.), *Encyclopedia of Global Archaeology*,
https://doi.org/10.1007/978-3-030-30018-0

time when the Alutiiq heritage movement was gaining momentum. As the director of a fledgling tribal museum, he set reestablishing cultural knowledge as a goal. Through archaeological inquiry, collections research, linguistic studies, and hands-on experimentation, his projects captured cultural information not found in the written record and reinvigorated traditions in the Alutiiq community. He calls this process "knowledge repatriation" (Haakanson 2004, 2007). He argues that helping native peoples learn from the archaeological record and collections is a powerful way to extend the value of cultural resources and promote partnerships that empower indigenous communities.

Haakanson is known best for his studies of ethnographic collections. From 2001 to 2008, he worked with the Château-Musée of Boulogne-sur-Mer, France (now call the Musée of Boulogne-sur-Mer) to develop an international exhibit of ancestral Alutiiq masks (Haakanson and Steffian 2009), connect Kodiak carvers directly to the works of their ancestors, and return carving knowledge to Alutiiq people by teaching skills preserved in the mask collection. From 2008 to 2012, he worked with museums in St. Petersburg, Russia, to develop a catalog of Alutiiq objects collected by early Russian traders in Alaska (Haakanson 2012), connect basket weavers with ancestral works, and teach weaving skills to youth. At present, he is leading studies of indigenous watercraft at the Burke Museum, building and launching traditional boats in partnership with culture bearers.

Haakanson's archaeological research includes a long-term study of the Cape Alitak petroglyphs (Figs. 1 and 2). This set of rock art sites at the southern tip of Kodiak Island holds the largest known assemblage of petroglyphs in Alaska. Since 2001, his research has expanded the number of known rock art localities from 5 to 13, documented over 1300 individual glyphs, recorded the settlement history of Cape Alitak, and created an accessible archive of rock art data at the Alutiiq Museum.

Throughout his work, Haakanson promotes scientific inquiry, museology, and Alutiiq values. Under his leadership, the Alutiiq Museum gained accreditation from the American Association of Museum (2011). The organization is only the seventh museum in Alaska and the second tribal museum in the United States to earn this rigorous national certification.

Haakanson is an accomplished artist. Museums and private collectors hold examples

Haakanson, Jr., Sven David, Fig. 1 Sven Haakanson on survey at Cape Alitak, 2010. (Photograph by Patrick Saltonstall, Cape Alitak Archaeological Survey Collection, Alutiiq Museum (AM688))

of his wooden masks, and his photographs are widely published. *National Geographic* magazine printed a selection of his images of the Nenets people in 1997 and photographs of the last Eyak Speaker Maria Smith in 2007. In 2015, Alaska's Rasmuson Foundation engaged Haakanson to develop *Living Alaska* (Haakanson and Steffian 2015), a traveling exhibit of contemporary Alaska artwork, and *Creative Alaska* (Haakanson and Steffian 2016), a book chronicling 277 Alaska artists supported by foundation funding. The book features Haakanson's photographs and interviews. In 2017, Haakanson carved a mask for Reconciliation Pole, a memorial to Alaska Native people sent to boarding schools. The work was sponsored by the University of British Columbia in collaboration with James Hart.

Haber, Alejandro Fabio

Laura R. Roda
Escuela de Arqueología, Universidad Nacional de Catamarca, Catamarca, Argentina

Basic Biographical Information

Alejandro Fabio Haber was born in Buenos Aires, Argentina, on September 16, 1964. In 1982 he began studying Anthropology at the Faculty of Philosophy and Arts at the University of Buenos Aires (UBA), graduating in Anthropological Sciences in 1988. His academic interests from early on were sparked by the Puna of Atacama in the Argentine Province of Catamarca. However, the allures of the place would be more than academic. In Catamarca he met Silvina Del Carmen Ahumada, then an archaeology student, married her, and stayed to share her life over 20 years ago. Together they had four children: Santiago, Ignacio, Francisco, and Valentina.

A constant challenge for Alejandro is the critical analysis of the supposed theorems about nature and culture that underlie archaeological narratives. This has led him to have an interest in a number of fields, among them "domestication," "the social appropriation of natural resources," "the ethno-archaeology of shepherds," "the zoo-archaeology of llamas and vicunas," "systems of settlement: oases and enclaves," "domesticity," the "uywaña" (the Andean concept of nurture), "environmental politics in indigenous territories," and "territorial wangling."

Alejandro Fabio Haber received his doctorate in Anthropological Sciences from the UBA in 1999, under the guidance of Dr. José Antonio Pérez Gollán. His thesis was titled *An Archaeology of the Oases of Puna: Domesticity, Interaction, and Identity in Antofalla in the First and Second Millennia BP*. In it, he deconstructs the geographical image of the Puna of Atacama as a marginal landscape and incorporates it into the archaeological discourse. This signals the bond between Puna of Atacama landscape's narrative and the successive practices of appropriation of Puna territory by outsiders. This indicates the solidarity between the different scientific disciplines, in this case archaeology, and the colonial progress plan.

Apart from this thesis, Alejandro conducted several research projects in the Comunidad Indígena Colla Atacameña de Antofalla (the Atacama Colla Indigenous community of Antofalla). These projects have been embraced by the members of the community to the extent that some of them have been actively involved in research projects by Alejandro and his team. Significantly, they have even been involved as coauthors. The affection and wisdom of the locals from Antofalla has strongly guided Alejandro's academic interpretations. Undoubtedly, the Puna ancestral teachers have left their imprint on his work and his life. Perhaps it is this mutual friendship that warrants the classification of this biography under "Indigenous Archaeologies."

With the Colombian anthropologist Cristóbal Gnecco, Alejandro has initiated several archaeological projects that move towards the decolonization of his own discipline and his own work. An example of this is founding the publication *Arqueología Suramericana/Arqueología Sul-Americana* ("South American Archaeology,"

in Spanish and Portuguese). The first issue was published in 2005 with the support of the Anthropology Department from the University of Cauca, Colombia, and the World Archaeological Congress (WAC). The beginning of the first editorial encapsulated the spirit of this endeavor, positing that the search for historic meaning is a form of resistance to the postmodern devaluation of the past (Haber and Gnecco 2005: 2).

Currently, Alejandro is an independent researcher with CONICET (the National Scientific and Technical Research Council of the Argentine government), a member of the Academic Committee and coordinator of Indigenous Studies in the Doctorate of Human Sciences, Faculty of Humanities, of the National University of Catamarca (UNCa), and the incumbent lecturer of "Archaeology of the Old World II" and "Research Design" at the UNCa School of Archaeology.

As demonstrated by his most recent works, Alejandro is thinking of an "undisciplined archaeology" and a "non-methodology" which lets us find ourselves again in the "colonial wound," in the immense community of life, still charmed by the land to which all creation eventually returns.

Major Accomplishments

Alejandro Fabio Haber has presented a dozen national and international academic lectures. He has been invited to teach numerous graduate and postgraduate courses at the University of Buenos Aires (Argentina), the Universidad of Cauca (Colombia), Columbia University (USA), Sociedade de Arqueologia Brasileira (Brazilian Archaeological Society, Brazil), University of Melbourne (Australia), Universidad de la República (Republican University, Uruguay), and University of Cambridge (UK), among others. He is a member of the World Archaeological Congress (WAC) Ethics Committee and a member of the Editorial Committees of several publications in archaeology. Alejandro has received an external postdoctoral scholarship from CONICET and been a Visiting Research Fellow at Flinders University (South Australia). He has been awarded national and international grants for his research from such entities as UNCa (National University of Catamarca), CONICET, Agencia Nacional de Promoción de la Ciencia la Técnica (National Agency for the Promotion of Science and Technology), the National Geographic Society, and Wenner-Gren Foundation for Anthropological Research.

Furthermore, Alejandro has supervised dozens of theses and scholarship holders for CONICET and FONCyT (the National Science and Technology Fund, Argentina). He has published numerous articles and a total of six books, among them the highly recommended *An Archaeology of the Oasis: Domesticity, Interaction, and Identity in Antofalla, Puna de Atacama, Argentina, First and Second Millennia B. P.* (Haber 2007).

Writing on the Wall: A Personal Perspective on Living near Hadrian's Frontier

Leslie Carlin
Department of Physical Therapy, University of Toronto, Toronto, ON, Canada

I lived for a decade in Durham City, to the south and nearly in the shadow of Hadrian's Wall. I arrived one dark January by train after flying from my home in sun-filled Southern California to Heathrow airport in London, bringing with me huge suitcases packed with entirely the wrong sort of clothing for the frigid north of England. I dragged my bags across the capital to King's Cross station and boarded a train. Three hours later Ishoved theluggage onto the station platform in Durham, fearful that the train doors would close with me still inside. Durham, for all its stunning beauty, is a brief, inconsequential stop on the northeastern line running up the right side of England. For an entire month, I shivered indoors and out in my inadequate apparel before discovering the superior protection offered by wool and leather over the array of cotton, waterproof nylon, and shiny black plastic boots I had brought. I learned my way around Durham on foot and schemed about accessing a car to explore further. Hadrian's Wall had fascinated me for years. I knew that by a miracle of luck and timing and connections, I now had an address not far from this near-mythic structure. When the days grew longer and the rain stopped, I would get there.

Spring arrived, late and doubtful, heralded by herds of daffodils around the walls of Durham Castle, and then summer, which brought me friends from the Netherlands, Jolien and Okke and their two children, their clothing and camping gear all packed into a red Renault 5. A car Transport. After a day in Durham, they said, "Let's go see Hadrian's Wall," and squeezed me in between the children, and we rumbled northward.

"Hadrian's Wall is an epic World Heritage Site, marching 73 miles from sea to sea across some of the wildest and most dramatic country in England," says English Heritage, guardians of Hadrian's Wall today. Anticipation mounted. We stopped first at Chesters, a fort not quite on the wall. I stifled my impatience: so near, yet not there. We admired the intricate plumbing and heating that allowed the Romans to be warm in a place and among people for whom the importance of warmth fell lower in the hierarchy of needs. And then, at last, we reached the fort of Housesteads, the northern boundary of which is Hadrian's Wall. The long uphill approach to the fort is quietly dramatic, like the curtain at a theater. At the top, the stage. I had arrived at Hadrian's Wall. I never felt more like an American bumpkin than I did right then, looking north across the erstwhile land of the Picts, my back to the south, the faraway home of the Romans.

They had left their mark, those Imperial forces. The inner walls and rooms and the communal toilets looked as if they might be the start of a construction project just beginning rather than one that had toppled from nearly two millennia ago. The top of the world and the ends of the world, the soldiers must have felt. We walked the portion of the wall which was far wider than I had anticipated, a soily, loamy path bordered by stones. The route back to the car park involved, inevitably, passage through the English Heritage gift shop. I bought some Roman figurines for my friends' children.

From Housesteads, on advice from fellow tourists, we drove a short distance westward and turned off the B6318 at the signpost for Once

Brewed, to see Steel Rigg. "The wall looks most wall-like there," we had heard, and found it true. The view is stunning. There is a wall, and there are the rolling green hills and heathered soil supporting – fertilizing – the wall. Nothing more, bar the stretching sky, blue and gray, over the narrow length of stone unspooling east and west.

That was my first time. Hadrian's Wall became one of my favorite places during the decade I lived in Durham. I escorted, or perhaps dragged, as many of my visitors as I could manage. Mostly guests stayed for three days. Day One we explored the magic of Durham. Day Two, up the Northumbrian coast to exclaim over the coastline and the castles, timing our journey with the tide so we could drive the causeway to Lindisfarne, the Holy Island. En route home, dinner in Newcastle, on the Quayside, at Leyla's in Dean Street while it lasted (across the street from the secret stairs to the Vampire Rabbit). Day three, saving the best for last, we headed to Hadrian's Wall, always the same stops: Chesters, Housesteads, and then Steel Rigg. Once, I experimented with adding the museuam at Vindolanda, more densely packed full of things and information than Chesters but somehow lacking its ghosts. We always bought mementos at the gift shop. An English Heritage scarf one very cold day, or little metal figures of centurions and legionnaires for my father, or plastic toys that various children (including, eventually, my own) loved for at least ten minutes. I once took an American friend and her young sons along with my own toddler to the wall. "Oh my! This is Hadrian's Wall! From a long time ago!" my friend exclaimed, reminding me of myself many years earlier. I bought her a tea towel printed with images of Roman soldiers. On the advice of an archaeologist I knew, we headed to Aydon Castle. "It's my favorite castle," the archaeologist confided. It is pretty perfect as an ancient castle. We liked it very much and bought ice creams from a truck in the car park. Mine made me violently ill on the way home though, so I learned to stick to my regulars. Chesters, Housesteads, and Steel Rigg. My wall.

Hadrian wanted his wall to keep the Picts out of Roman Britain. What is it with walls? They support, separate, delineate, and fascinate. They enclose; they are exposed. There's the ancient Great Wall of China, the cataclysmic, now-collapsed Berlin Wall. The Wailing Wall in Jerusalem. Walls around cities. A contested, as-yet-unbuilt wall between the United States and Mexico. Perhaps all walls are contested.

What must the Romans have been thinking, standing in the freezing gray of a Northumberland June, compacting earth, and topping it with stone and mortar? They could not have been happy. And then off they would go, these unfortunate soldiers and slaves, to sit in a communal toilet and to take refuge in the heated bathhouses.

Hadrian's Wall extended from the Irish Sea to the North Sea across England's narrow neck (clever Romans). When I started working at the University of Newcastle, my route from Durham required me to cross its eastern reaches daily. I could walk over it, stopping for coffee at the Wall Café if I had time. Newcastle has made efforts at preservation, even knocking down some houses to ensure that the traces of Hadrian's Wall make their presence felt in the heart of the city; when I walked that route, I saw the wall. Other days I might ride the Metro and pass underneath, but there it was, in my way. Eventually I lost the sense of amazement that my weekday commute encompassed such a wonder of the world. Hadrian's Wall is both a landmark and unremarked in the north.

At the eastern reach of Hadrian's Wall is the fort called Segedunum – probably meaning "strong place" – now a tourist attraction in the town of Wallsend. One of my children went to Segedunum on a school trip. The fort butts against the River Tyne at the point where the river itself makes a sharp right turn to the North Sea and takes over the defensive role of Hadrian's Wall. Wallsend, now a part of the city of Newcastle, became a center for shipbuilding until it slipped and slid and declined with the regions' coal mines. "The Last Ship," an extravagant musical show by Sting, a native son, dramatizes the effect of the industry's demise. A line in the play mentions Hadrian's Wall "running from Wallsend to Penrith." I saw the show in Toronto, where I live now, and had an eerie sense of the wall running

through Cumbria and right across the Atlantic Ocean into North America, following me. In a way, in the hold it has on world's imagination, Hadrian's Wall circles the globe. The narrative of men from Rome and from its conquered lands, ranging from the eastern Mediterranean to northwest Africa, walking north and further north and building a wall for their emperor and homes and bathhouses and lives for themselves, is a small story about the bigger story of human migration. Those men left their graffiti and their genes behind. A rare African Y chromosome has been traced to a family lineage in Leicester and may well have come from a soldier guarding Hadrian's Wall.

I moved from California to live by Hadrian's Wall and then moved again to Englands southern coast and then again to Canada. I am a migrant. I live now in a city, Toronto, where over 50% of the population was born outside of Canada. Immigrants and refugees have walked, flown, sailed, and driven here. The native inhabitants of the Americas, the First Nations, and indigenous peoples built no walls; perhaps they should have. Would that have helped them?

Apparently John F. Kennedy said of the Berlin Wall when it was erected: "A wall is better than a war." I woke up one morning to hear someone on the Canadian national radio station, the CBC, saying, "Border walls often increase the insecurity they're intended to stop." Borders cannot be impenetrable, commented the academic. (I look around at my own office: four walls, three of them punctured by doors or windows. Not impenetrable.) "For a while it may look like it is working, but actually it will just reroute and redefine the flows [of people and goods crossing the border]," said Elisabeth Vallet, an adjunct professor and scientific director in geopolitics and the Raoul Dandurand Chair at the University of Quebec. Another professor talked about border walls as architecture and as sites for creativity. A growing "wall culture" exists in the US/Mexico borderlands; Professor Ronald Réal of University of California, Berkeley, described wall volleyball, wall art, and wall horse races. He called that wall "the largest art gallery" as artists render their imaginations on its surface. Ana Fernandes, for instance, paints the wall blue. The graffiti on the Berlin Wall and its remains have become tourist attractions. A few rare examples remain of Roman era graffiti chiseled into Hadrian's Wall; with the same woad possibly used by Picts to paint themselves blue, Roman soldiers sketched images of the blue Mediterranean of their home.

Their legacy lives on in the wayward chromosomes but more so in those of us who visit the forts, who walk the Wall, and who buy the tea towels.

My son Eli, June 1999, lecturing at Housesteads

Hall Dohan, Edith Hayward

Shay K. Hannah
Flinders University, Bedford Park, SA, Australia

Basic Biographical Information

Edith Hayward Hall was born on December 31, 1877 in New Haven, Connecticut, to Ely Ransom and Mary Jane Hall. Throughout Hall's childhood, her father, a Yale graduate, instilled the importance of a fine education which would be

reflected in her later life (Thompson 1971; Morrow 2007). From 1888, Hall attended Woodstock Academy where Hall's love for the Greek culture and language would become apparent (Morrow 2007). After graduating from Woodstock Academy, Hall would attend Smith College in Northampton, Massachusetts, selecting the "Classical Course" as her major (Morrow 2007). Graduating from Smith College with a Bachelor of Arts, Hall would continue her academic career by attending Bryn Mawr College in Pennsylvania where she studied Greek archaeology (Morrow 2007). A constant struggle with poverty would plague Hall throughout her years of study at Bryn Mawr College, but thanks to her being awarded Mary E. Garrett European Fellowship, Hall was able to study at the American School of Classical Studies in Athens. In October 1903, Hall went on her first archaeological expedition to Athens, Greece, and would stay on till 1905, thanks to a stipend received from a fellowship founded by the Hoppin family which hoped "lift the restrictions on women in the study of archaeology" (Thompson 1971). While in Greece, Hall was invited to join an excavation to Gournia and Crete under the direction of Harriet Boyd Hawes. In Crete, Hall found material for her doctoral dissertation of 1907, *The Decorative Art of Crete in the Bronze Age* (Thompson 1971). Graduating with her dissertation in 1908, Hall accepted the position of instructor in classical archaeology at Mount Holyoke College where she would stay on till 1912. During these 4 years, Hall would revisit Crete doing work for the University of Pennsylvania at Sphoungaras in 1910 and at Vrokastro where she would be in full charge between 1910 and 1912 (Thompson 1971). Hall would leave Mount Holyoke College to become assistant curator at the University of Pennsylvania Museum, where she supervised the rearranging and cataloguing of the large collection of classical antiquities as well as publishing articles on a varied range of archaeological material. On May 12, 1915, Hall married Joseph M. Dohan, a lawyer and gentleman farmer, and the following years would see the arrival of their two children David Hayward Warrington and Katharine Elizabeth (Morrow 2007; Thompson 1971). In 1920, the now Mrs. Dohan returned to the University of Pennsylvania Museum where she became associate curator and would become curator of the Mediterranean Section. Dohan would undertake review editorship of the *American Journal of Archaeology* in 1932 and held the position until her death. It was in her middle age that Dohan changed her professional direction to focus on Italic archaeology. From her work cataloguing the previously uncatalogued Etruscan material in the University Museum, Dohan could reconstruct the original tomb groups and set up her Italic tomb groups in the University Museum in 1942, which was acclaimed by experts. Considered Dohan's most important work, it was hailed as "the first attempt ever to establish a synchronology of seventh-century Etruscan graves" (Thompson 1994). Dohan's next project, the study of Etruscan bucchero ware, was cut short by her death in 1943, aged 65. She was buried in a cemetery in Woodstock, Connecticut (Thompson 1994).

Hall Dohan, Edith Hayward, Fig. 1 Edith Hayward Hall Dohan, taken at the University of Pennsylvania Museum, ca. 1940. (courtesy of the University of Pennsylvania) Bryn Mawr College and Thompson (1971)

Major Accomplishments

Edith Hayward Hall Dohan was one of the first American female field archaeologists and was instrumental in the cataloguing and collecting of materials for the Mediterranean Section in the University of Pennsylvania Museum, helping build the collections that are today known throughout the world. Dohan would publish 4 books and over 50 articles (Morrow 2007) (Fig. 1).

Hall, Edward T.

A. Mark Pollard
Research Laboratory for Archaeology and the History of Art, University of Oxford, Oxford, UK

Basic Biographical Information

Edward Thomas (Teddy) Hall (1924–2001) was born in London in 1924, the son of Lt. Col. Walter D'Arcy Hall, and grew up at Shipton Court in Oxfordshire. His grandfather, Thomas Hall, had left England in straitened circumstances in 1854 for Australia and returned at the end of that century a multimillionaire from his interests in the Mount Morgan goldmine. Following Eton, Teddy joined the Royal Naval Volunteer Reserve in 1943 and served during the Second World War in charge of a group of landing craft. In January 1946, he came to New College, Oxford, to read chemistry. On graduating, he decided to turn his hand to physics and offered his services to the head of the Clarendon Laboratory, Prof. Lindemann, later Viscount Cherwell, who, on learning that he required no payment, promptly set him to work! He worked in a team which designed and built a mass spectrometer for measuring ^{3}He in order to date rocks. He then turned his attention to X-rays and designed and built the first X-ray fluorescence spectrometer for the non-destructive analysis of museum objects.

Major Accomplishments

His first significant application was the analysis of the Piltdown skull, which had been found by Charles Dawson between 1912 and 1914 in a gravel pit near Lewes in Sussex. Teddy persuaded Kenneth Oakley of the Natural History Museum in London (by means of a lobster lunch!) to bring the skull to Oxford in 1949, and his XRF analysis showed high concentrations of chromium, which he attributed to artificial staining. He submitted his D.Phil. thesis (*Quantitative Analysis by Secondary X-Rays for Use Particularly in Archaeology*) in 1953. With the support of Lord Cherwell, Teddy was introduced to Christopher Hawkes, Professor of European Archaeology, at a dinner in Christ Church in 1949, and the resulting great friendship between the two led to the establishment, in 1953, of the Research Laboratory for Archaeology and the History of Art (RLAHA), in a Victorian terraced house in Keble Road. Typically, he made a deal with the University that he would forfeit his own salary in return for another position, and so Stuart Young, another physicist, was appointed as Deputy Director of the Lab in 1955, to be replaced, in 1957, by Martin Aitken.

Teddy's interests rapidly spread from XRF to other aspects of archaeometry, including optical emission spectrometry, electron microprobe analysis, and magnetometry (including proton magnetometers for marine survey work). He also developed equipment for monitoring ultraviolet levels within museums. He started a business manufacturing such equipment from a workshop at his house (Beenhams) in Littlemore, the Littlemore Scientific Engineering Company (LSEC). In addition to manufacturing equipment for archaeologists and museums, LSEC also made the "Cavendish Chair," in response to the plight of his friend Robin Cavendish, who contracted polio in Kenya and was flown back to England on a ventilator. To reduce the restrictions imposed by the cumbersome nature of the ventilator, Teddy developed a lightweight ventilator which ran on batteries, fitted to a modified aircraft seat on wheels, which gave him a certain degree of mobility.

During the late 1970s, along with Robert Hedges, he became increasingly interested in making radiocarbon dates by direct measurement of the ^{14}C atoms present using accelerator mass spectrometry, and in 1981 RLAHA took delivery of one of the first dedicated radiocarbon accelerators. In the early days, Teddy would often be found crawling inside the accelerator tank, or discussing design modifications, or even sweeping the floor. The first dates were published in 1984 in the journal *Archaeometry*, which had been founded by Teddy and Martin in 1958 as the Bulletin of the Research Lab. The Oxford Radiocarbon Dating Unit has now produced more than 22,000 archaeological radiocarbon dates.

One date in particular has created considerable public interest – that of the Shroud of Turin, which in 1988 was independently dated by three laboratories (Oxford, Zurich, and Arizona) to between CE 1260 and 1390. The Archbishop of Turin had written to Teddy in 1978 (when the Shroud was publicly displayed for the first time in 30 years) asking if it was possible to date it by radiocarbon. He replied to say that dating by AMS, when the technique was perfected, would enable a date to be obtained on a few milligrams of cloth. Consequently, in September 1986, a meeting took place in Turin where representatives of seven AMS laboratories proposed a protocol for the analysis. A year later, it was announced by the Cardinal of Turin that the Shroud would be dated by three laboratories, with the project to be coordinated by Dr. Michael Tite of the British Museum. Samples were taken in April 1988, and the results were announced in October of that year. The result that the Shroud is of medieval manufacture has not been accepted in all quarters, and the debate continues. Criticisms of the date range from the outlandish to the vaguely plausible, but Teddy's view was predictably robust: "Some people may continue to fight for the authenticity of the shroud, but this settles it once and for all as far as we are concerned."

He married Jeffie de la Harpe in 1957 and had two sons, Martin and William. He was made a Professor in 1975 and in 1989 Emeritus Professor of Archaeological Sciences, on his retirement from the University. In 1973 he was appointed a Trustee of the British Museum and also of the National Gallery. He also sat on the Advisory Council of the Science Museum. He was made an Honorary Fellow of the British Academy in 1984 and was appointed CBE in 1988. When he retired, the University realized that it was likely to have to pay a salary to his replacement and, like all universities, immediately claimed poverty, thus threatening the future of RLAHA. In response, Teddy launched an appeal and raised a million pounds to endow a Chair, which is now known as the Edward Hall Professorship in Archaeological Science.

Over and above his considerable scientific achievements, Teddy has always been a larger-than-life character. From being a collector of cigarette cards as a child, he became fascinated by Chinese porcelain in the 1950s and assembled a world-class collection of monochromes. He also collected clocks and scientific instruments, but, unlike many museums, was not averse to taking them apart and analyzing the brass from which they were made! In order to keep himself sane in retirement, he decided to make a pendulum clock with the accuracy of a quartz watch. The Littlemore Clock was housed in a wooden shed

in the garden of Beenhams, sitting on a 12-t block of concrete. Teddy was gratified to find that after 3 years of running, his clock had kept better time than the US Naval Observatory clock and was probably the most accurate pendulum clock ever built!

His summer Laboratory parties at Beenhams became the stuff of legend – strawberries and champagne around the swimming pool, followed by a trip in his hot air balloon for the chosen few! Not only was he gifted and generous, he was a world-class scientist, and the world of archaeology owes him a huge debt of gratitude.

Hall, Martin (Historical Archaeology)

Natalie Swanepoel
University of South Africa, Pretoria, South Africa

Basic Biographical Information

Professor Martin Hall was born in Guildford and spent his youth in the south of England. He studied Archaeology (both undergraduate and postgraduate degrees) at Cambridge University where he was influenced by David Clarke and Eric Higgs. Although he had initially wanted to study Sociology, he took Anthropology and Archaeology in his 1st year and, after a fieldtrip to Bulgaria, switched his interest to Archaeology. After working as a contract archaeologist in London and assisting on Stone Age excavations in Lesotho, he embarked on Ph.D. fieldwork on the South African Iron Age under the supervision of David Clarke. He was employed as an ethnoarchaeologist at the Natal Museum (today the KwaZulu-Natal Museum) in Pietermaritzburg from 1975, taking up the appointment of Chief Archaeologist at the South African Museum in Cape Town upon the completion of his doctorate in 1980. He joined the Department of Archaeology at the University of Cape Town in 1983, becoming a full professor in 1991 (Lucas 2006).

After a number of years as the Chair of Historical Archaeology and Head of the Archaeology Department at the University of Cape Town (UCT), he moved into the administrative sector of the university. He acted as the inaugural Dean of Higher Education Development for 3 years and as the Deputy Vice-Chancellor of UCT for 6 years while continuing to publish in archaeology. He served as the Vice-Chancellor of the University of Salford (United Kingdom) from 2009 to 2014 (Martin Hall n.d.). He returned to Cape Town in 2015, where he is now associated with the UCT Graduate School of Business as Emeritus Professor. He continues to publish and provide commentary on a wide range of issues including heritage, media, virtual technologies, and higher education. Examples of these can be obtained at martinhallfacilitation.org.

Major Accomplishments

In a career that has included a diversity of research interests – the South African Iron Age, the making of the modern world, the social and political context of archaeology, the representation of the past, technology in pedagogy, and the role of tertiary education and the university in society – Hall's most prominent accomplishments in the field of archaeology are his contribution of a critical, materialist perspective to the study of the Iron

Age and his role in the establishment and development of the subdiscipline of Historical Archaeology in South Africa. Hall's doctorate focused on Iron Age settlement patterns in KwaZulu-Natal where he adopted an ecological perspective shaped by the New Archaeology's processualist approach, but, as he became more engaged with the politics of archaeology, he disengaged from the idea of a purely "scientific archaeology" (Lucas 2006), a move clearly evident in his 1987 book *The Changing Past: Farmers, Kings and Traders in Southern Africa* (Hall 1987), which took a materialist approach to the study of the Iron Age, in addition to situating Iron Age studies within the larger social and political contexts of their time (also see Hall 1984a, b).

The move away from a purely "scientific" approach to the past, within the increasingly fraught political context of apartheid South Africa, also spurred Hall's interest in the archaeology of colonial settlement and the potential that archaeology had to add to a different interpretation of that past. This development was solidified by the presence of Mark Leone and James Deetz who spent time as guest lecturers at the University of Cape Town in the mid-1980s (Lucas 2006). In collaboration with colleagues and students, Hall was involved in numerous historical projects in and around Cape Town producing a series of seminal articles reporting on work at sites such as Paradise, Onrust, the Barrack Street Well, the Castle, and the urban landscape of Cape Town, resulting finally in the publication of his book *Archaeology and the Modern World: Colonial Transcripts in South Africa and the Chesapeake* (Hall 2000). This period also saw ongoing collaboration with the University of California, Berkeley, and the establishment of the Historical Archaeology Research Group and the Archaeology Contracts Office at the University of Cape Town Archaeology Department (Lucas 2006). Hall's students at this time undertook studies of architecture, probate records, and various sites in and around Cape Town.

Hall organized the first World Archaeological Congress held in Africa at Cape Town in January 1999 (highly symbolic of South Africa's return to the international fold) and served as President of the organization from 1999 to 2003. In addition to all of his other accomplishments, Hall (1996) also produced a textbook, *Archaeology Africa*, which was the first introductory archaeology text to present the history, method, and theory of archaeology from an African perspective. Although no longer actively involved in primary archaeological research, Hall (2016) continues to engage with issues of materiality and multivalent sources in his analyses of issues pertaining to the modern world.

Hall, Martin (Modern World)

Martin Hall
The University of Salford, Salford, UK

Basic Biographical Information

I began research in 1975, when I was appointed Ethnoarchaeologist at the Natal Museum in Pietermaritzburg, South Africa. My interest was in early farming settlement from the first millennium through until the rise of the Zulu Kingdom in the early nineteenth century. At this time, few radiocarbon dates had been obtained, and it was widely argued that the first Black farmers had arrived in southern Africa at much the same time as white colonists had moved northwards and eastwards from the Cape. This work culminated in my books *Settlement Patterns in the Iron Age of Zululand: An Ecological Interpretation* and *The Changing Past: Farmers, Kings, and Traders in Southern Africa, 200–1860* (Hall 1987).

Doing archaeology of this kind in apartheid South Africa was inherently political, as I realized when I published my radiocarbon dates for a first millennium farming settlement. I developed this connection between politics and practice in a series of papers published in the *South African Archaeological Bulletin*, *World Archaeology*, *American Antiquity*, and *Archaeology*. This trend in my research culminated in my book *Archaeology Africa* (Hall 1996) and in my invited contribution on Africa for the British Academy's millennial view of global archaeology (Hall 2002).

On joining the Department of Archaeology at the University of Cape Town in 1983, I became interested in the archaeology of colonial settlement, at that time almost unexplored. With a group of master's and doctoral students and in partnership with the University of California Berkeley (then a leading center for Historical Archaeology), we began fieldwork at a number of seventeenth- and eighteenth-century sites, looking particularly for evidence of slavery, the underclass and the ways in which colonial domination was marked through material culture.

Research in Historical Archaeology – as in other parts of the world – is closely related to cultural resource management. In order to gain access to sites of importance, promote site conservation, and fund archaeological research in partnership with the public and private sector, I founded the Archaeological Contracts Office in partnership with colleagues in the Archaeology Department. Between 1987 and 1993, I was responsible for a range of cultural resource management projects, including field surveys, urban excavations, and a major project at the Castle in Cape Town.

Our initial research in Historical Archaeology was brought together in two collections of papers, the first in *Social Dynamics* and the second, edited jointly with Anne Markell, in the *South African Archaeological Society Goodwin Series*. My own interest has been in the way that multiple sources of evidence could be used to expand the range and depth of archaeological interpretations. This is well represented by my study of the work of nineteenth-century Cape artists, published in the *South African Journal of Art and Architectural History*, by my chapter in *The Art and Mystery of Historical Archaeology: Essays in Honor of James Deetz* (Hall 1992) and by my paper on the ambivalences of gender in the archaeology of colonialism (Hall 1997). A prospectus for this approach to archaeological interpretation was developed in full in my book *Archaeology and the Modern World* (Hall 2000) and in the collection of essays co-edited with Stephen Silliman.

Major Accomplishments

My interests in multiple sources of evidence and in the connections between material culture, identity, and political practice have resulted in a theme of interpretation that reaches beyond the traditional disciplinary boundaries of archaeology. I started exploring this in my contributions to Malcolm Payne's artwork, *Face Value: Old Heads in Modern Masks*; Terry Kurgan's portfolio of prints, *Bodyparts*; and photographer Mark Lewis's piece on the Lost City and in fictional writing for young adults. This direction led to an awareness of the ways in which material culture, identity, and memory can be interwoven "beyond words," ideas that I have explored in a series of publications. "Blackbirds and Black Butterflies" and "The Reappearance of the Authentic" (Hall 2006) extend the interpretation to other parts of the world. My essays "Industrial Archaeology of Entertainment" (Hall 2005) and "Las Vegas in Africa" extend this line of thinking to show how the past is appropriated in the late capitalist imaginary.

Hall, Robert Leonard

Alice Beck Kehoe
Marquette University, Milwaukee, WI, USA

Basic Biographical Information

Robert Leonard Hall (Fig. 1), of Stockbridge Mahican and Menominee descent through his mother, was born on February 8, 1927, in Green Bay, Wisconsin, where his father William Taylor Hall was a partner in a family grocery store. Robert Hall died on March 16, 2012, of cancer. Hall earned his B.A., M.A., and Ph.D. degrees, 1950, 1951, and 1960, from the University of Wisconsin-Madison. In 1958 he married Barbara Lee Mohr, with whom he had four daughters and four grandchildren. Robert Hall was 6 ft tall, with dark hair and blue eyes and a warm, gentle manner.

Hall, Robert Leonard, Fig. 1 Robert L. Hall

Robert Hall's modesty and sense of humor belied a remarkable intelligence able to grasp recondite Mayan calendar astronomy as well as technical details of Midwest archaeological materials. His power of visual synthesizing enabled him to discern symbols in Mesoamerican and North American artifacts and mythology and think through them into profound meanings, often shared over wide areas and millennia of time. Familiarity with his own Mahican and Menominee heritage and the cultures of the Oneida and Ho-Chunk (Winnebago) neighboring the Stockbridge and Menominee Reservations sensitized Hall to indigenous understandings of the cosmos and its inhabitants. His book *An Archaeology of the Soul: North American Indian Belief and Ritual* (1997), reprinted several times, brought together a wide range of archaeological and ethnological researches, proposing deep-time traditions through which, for example, the atlatl, outmoded as a weapon, became the potent stem of calumet pipes. Hall himself illustrated and laid out the book design for this notable work.

Hall's interest in archaeology led him to work at his hometown's Neville Public Museum while in high school, 1943–1945. His scientific ability won him national second place (out of 40 finalists) prize in the 1945 Westinghouse (now Regeneron) Science Talent Search for high school seniors. Military service as Seaman 1/c with the Navy 1945–1946 interrupted this, to be resumed when he worked as a student at Wisconsin State Historical Society Museum, 1946–1949, and then as a curator (level 1) in anthropology, 1949–1953. Summers 1947 and 1948, Hall worked on a crew of the Smithsonian Institution River Basin Surveys Missouri Valley Project. His first career-related employment after receiving his Ph.D. was at the University of South Dakota, Vermillion, where he was Director of the Institute of Indian Studies, 1959–1961. Then he moved to the Illinois State Museum, Springfield, serving as Curator of Anthropology 1962–1967 and after a year at Marquette University in Milwaukee, Wisconsin, as Associate Professor of Anthropology, settling into his principal academic home at the University of Illinois at Chicago as Associate

and then Full Professor of Anthropology, from 1968 until retiring with emeritus status in 1998.

Robert Hall presented his first scientific paper, coauthored with Warren Wittry and Robert Linck, in 1944 at the annual meeting of the Wisconsin Academy of Sciences, Arts and Letters. More than 60 years later, he coauthored the position paper "Cosmology and Society in the Ancient Amerindian World" and presented his own paper "The Role of Metaphor in Perceived Cosmologies: Variation and Redundancy in Metaphors of Sky-Earth Dualism" at a workshop of the prestigious Santa Fe Institute. He presented over 60 papers at professional conferences and published more than 30 chapters in edited volumes and articles in journals ranging from *American Antiquity* to *Archaeoastronomy*.

Major Accomplishments

Robert L. Hall was one of the soundest empirical archaeologists working in North America, painstaking and thorough in his research and keen to perceive significant data, combining this care for observations with an often breathtaking insight into links with deep time, other societies, and other sciences such as astronomy. Hall was one of the first to point out that radiocarbon dates from maize and certain other grasses will differ by as much as several centuries in radiocarbon age from dates on wood of the same calendar age. He noted, years before other archaeologists realized it, that the constructions of certain burial mounds of the Midwest USA were ritual reenactments of earth creation as described in the widespread earth-diver myth. Hall studied historical documents and ethnographies to obtain ethnohistorical information to meld with archaeological interpretation. In 2006 the Ho-Chunk Nation wrapped him in an honoring blanket in gratitude for his contributions to their history. Midwest archaeologists presented him with a Distinguished Career Award in 2008 and a festschrift in 2003 (Richards and Fowler 2003). His work in progress, *Touching History: Four Centuries of Indian-White Relations Told as a Family Story*, relates his family lines, Stockbridge Mahican, Menominee, and Euroamerican, to significant events in American history to which they were witness.

Although Robert Hall has always been respected as an excellent field archaeologist, and his published dissertation analysis of Oneota ceramics is a classic in continuing demand, many Midwestern archaeologists have been uncomfortable with his use of indigenous cosmologies to deepen interpretation of archaeological and ethnographic data and with his presentations of Mesoamerican links with Anglo-American First Nations. Long before the term "indigenous archaeologies" was introduced, and long before most archaeologists learned of his Native American ancestry, Robert Hall was quietly working from an indigenous standpoint. During the 1970s–1980s heyday of the narrowly scientific "New Archaeology," Hall's interpretations grounded in ethnohistorical and indigenous approaches were not always taken seriously. Never discouraged, Hall continued pursuing breadth and depth, gradually winning wider respect for what have often been brilliant insights illuminating the great traditions of Mesoamerica and Eastern North America. His work is likely to remain foundational to archaeologies east of the Rockies, while fads and personalities fade.

Hamada, Kosaku

Makoto Tomii
Centre for Cultural Heritage of Kyoto University, Kyoto, Japan

Hamada, Kosaku, Fig. 1 Kosaku Hamada. (© Department of Archaeology, Kyoto University)

Basic Biographical Information

Kosaku (Seiryo, as a pseudonym) Hamada (1881–1938) was the father of archaeology in Japan (Fig. 1). He was born in Osaka. During his elementary school days, he became interested in ancient finds such as arrowheads. His first work on archaeological materials was published in 1898 during his junior high school days (in the old system of education; almost equal to the high school in the present educational system). After he graduated from Waseda Junior High School in Tokyo in 1899, Kosaku Hamada went to Third High School located in Kyoto. In 1902, he joined the Department of Occidental History at the University of Tokyo. In 1905, he finished an undergraduate course, having been supervised by Professor Tsuboi Shogoro. In his postgraduate studies, he focused on the relationship between European and Japanese art in ancient times, with the aim of elucidating the origin of Japanese ethnicity. Before becoming a lecturer of Kyoto University on 1909, he taught history and Japanese language at his alma mater (Waseda Junior High School) for several years.

From 1910 onward, Dr. Hamada acquired considerable experience in archaeological research, not only in Japan but also in East Asia. Immediately after being promoted to associate professor in 1913, he started a three year overseas inspection in Europe (1913–1916). One outcome of this was his subsequent establishment of the first department of archaeology in Japan. In hindsight, it appears that this European inspection was the preparatory work that formed Kosaku Hamada's framework for archaeology. This framework was based primarily on Flinders Petrie's archaeological methods and values. Soon after returning to Kyoto in 1916, Kosaku Hamada founded what is now the oldest department of archaeology in Japan, and became a professor of archaelogy in the next year. In 1922, he published the first textbook of archaeology in Japan, based upon

Flinders Petrie's *Methods and Aims in Archaeology* (1904).

Professor Hamada was awarded a doctorate by the President of Kyoto University in 1918. In 1927, he directed excavations of the Chinese prehistoric site, Hishika, as the first expedition of the Far Eastern Archaeological Society. In 1931 he was recommended for membership of the Japan Academy. He became the President of Kyoto University, but one year later, in 1938, he died of renal failure while in office as the President.

Major Accomplishments

In spite of his early death, Dr. Hamada's career in archaeology spanned 40 years. His interest in the origin of the ethnic culture of Japan does not seem to have borne much influential fruit in Japanese prehistory in itself. However, this interest must have served as a tool through which he understood the contemporary state of archaeological aims and methods. The outstanding accomplishment of his archaeological career was *Tsuron Koko-gaku* (*An Introduction to Archaeology*) which was published in 1922 and used as the textbook of archaeological methodology for several decades.

As a practical archaeologist, Dr. Hamada fully understood the importance of introducing the principle of stratification to archaeological excavations in Japan. It is likely that one of the reasons he excavated several shell middens was to prove to himself the importance of recognizing stratigraphy. He also took part in the first systematic archaeological research project by an academic organization in Japan: the series of excavations in Saitobaru tombs in Kyushu Island, undertaken from 1912 onward. After coming back from his European inspection, Dr. Hamada organized excavations of the tombs himself. This project is likely to have been guided by his interest in the origin of Japanese ethnicity, and probably, the same kind of motivation led him to excavate some of the above-mentioned shell middens; prehistoric human bones surrounded by shell can often survive in contrast to the ordinary soil condition in Japan. This interest was shown too in the excavations of Ko site in Osaka, undertaken from 1917, where he tried to identify the first evidence of Paleolithic settlement in Japan, inspired by the find of an ancient stone implement like a hand-axe.

As a missionary of sophisticated archaeology, Dr. Hamada formalized the style of editing an excavation report, which definitely improved Japanese scholars' recognition of archaeological findings as not only past remains but also historical resources. Moreover, Dr. Hamada paid great attention to publishing a report precisely and in a proper time after excavation, possibly because he concurred with Petrie's view on ethics in archaeology (1904).

As the founder of the first department of archaeology in Japan, Dr. Hamada not only collected past remains even from overseas but also rigorously recorded archaeological materials with clear information on context and location. He used these materials to develop archaeological education in the department and also produced a condensed English version of some archaeological reports. Considering his various accomplishments together, it appears that Kosaku Hamada consciously worked on a number of fronts in order to ensure that archaeology in Japan caught up with the high standard of archaeology in European countries such as England and France as quickly as possible.

Hamster: Domestication

Peter Fritzsche
Institute of Biology/Zoology, University of Halle-Wittenberg, Halle, Germany

Basic Species Information

The golden hamster *Mesocricetus auratus* (Waterhouse, 1839) belongs to the class of mammals and to the subfamily hamster (Cricetinae): Order: Rodentia, Suborder: Myomorpha, Superfamily: Muroidea, Family: Cricetidae. This subfamily consists of approximately 20 species. The natural distribution of all hamsters belongs to the northern hemisphere in the palearctic region (Europe and Asia). The most well-known hamsters are species from the three genera *Cricetus*, *Mesocricetus*, and *Phodopus*.

The genus *Cricetus* consists only of one species, the common or European hamster *Cricetus cricetus* (Linneaeus, 1758). This is also the largest species of hamsters, with up to 30-cm body length and up to 1 kg body mass. The common hamster is widely distributed from the eastern part of Russia to the Netherlands and France in the west. There are three species in the genus *Phodopus*: the Dsungarian dwarf hamster *P. sungorus* (Pallas, 1773), Campbell's dwarf hamster *P. campbelli* (Thomas, 1905), and the Desert hamster *P. roborovskii* (Satunin, 1903). These three species of dwarf hamsters are relatively small (up to 10 cm and up to 50 g). They were brought to Europe in the 1970s and are used in scientific research in laboratories and kept as pets. Four to five species are described in the genus *Mesocricetus*, the so-called middle hamsters. One is the golden hamster and the other three are the Turkish hamster, *M. brandti* (Nehring, 1898), distributed in Anatolia (Turkey), Armenia to Iran; the Ciscaucasian hamster, *M. raddei* Nehring, 1894, living in Aserbaijan and Dagestan, and the Romanian hamster, *M. newtoni* (Nehring, 1898) which can be found in Romania and Bulgaria. The existence and relationship of a probable fifth species, *M. nigriculus*, is uncertain (Panteleyev 1998; Yigit et al. 2006) (Fig. 1).

The most prominent hamster is the golden hamster. In countries outside Europe, the word "hamster" refers to the *golden* hamster. The natural distribution of this species is very small. It occupies the northern part of Syria in the so-called Aleppinian Plateau (around and north of the city of Aleppo) and a southern portion of Turkey. The distribution of the golden hamster is limited by natural borders: the Mediterranean Sea in the west, the Taurus Mountains in the north, the Euphrates River in the east, and the Syrian Desert in the west (Gattermann et al. 2000). Burrows are mainly found in agricultural fields. As a result of the increasing urbanization in Syria, this species is increasingly endangered (Fig. 2).

Golden hamsters are mainly solitary animals with a promiscuous mating system. In captivity, they behave aggressively against conspecifics and grouping of unrelated animals is impossible. In the wild they live solitary in burrows approx. 65–100 cm deep dug by themselves. The individuals reach a length of about 18 cm and weigh up to 180 g. With their expendable cheek pouches, golden hamsters can carry about 20 g of grain into their burrow. In their natural habitat in spring and summer, and in captivity during the whole year, females are sexually receptive every 4 days. Only 16 days after successful copulation, they give birth to ~8 pups. Though golden hamsters

Hamster: Domestication, Fig. 1 Tree of the molecular phylogeny of hamsters (Neumann et al. 2006)

in the wild only live up to 2 years, in captivity, they can reach an age of 3 years.

The golden hamster is a popular pet and a widely used laboratory animal. Its unique domestication history started nearly 100 years after its scientific description in 1930 when an Israeli scientist discovered a female with 11 pups in an agricultural field near the city of Aleppo. Though the mother and several pups died, one female and three males survived. After successful mating, these animals established a captive hamster population that was the foundation for the entire modern domestic population that numbers several million individuals. No other mammal has achieved a similar breeding success from such a narrow gene pool.

In 1971, an additional 12 wild animals were brought to the USA (Murphy 1971). Since then, only a few golden hamsters have been caught in Syria and Turkey and they have not influenced the

Hamster: Domestication, Fig. 2 Distribution map of the golden hamster. Numbers indicate historic and recent records (Gattermann et al. 2000)

modern gene pool of domestic hamsters. In 1999, after an expedition to Syria, 19 wild hamsters were brought to the University of Halle (Germany). The wild hamsters have been compared to the inbred lab hamsters regarding genetic variability, morphology, and behavior. An expected reduction in genetic variability was found. The domestic (lab) hamster sample shows an evidently reduced genetic variability (Neumann et al. 2005). Surprisingly, a remarkable feature of the species is that the domestic (lab) strain shows nearly no signs of inbreeding changes or depression. Differences between the strains in morphology and behavior are very small (Gattermann et al. 2002; Schneider and Fritzsche 2011). Given the opportunity to choose between lab and wild males, females of the lab strain prefer males of the wild strain for mating. If wild males and lab males have the same time to mate with females of both strains, the reproductive success of wild males dramatically exceeded that of lab males. A kind of sperm competition seems to occur (Fritzsche et al. 2006).

Handaxes and Biface Technology

Adam Brumm
Centre for Archaeological Science, School of Earth and Environmental Sciences, University of Wollongong, Wollongong, NSW, Australia

Introduction

Few objects in the history of prehistoric archaeology have attracted such sustained scholarly interest – and proved so resilient to scientific explanation – as the handaxe.

Handaxe is an early term that is still widely used to describe an enigmatic type of stone tool found at archaeological sites across at least two-thirds of the Paleolithic Old World (Lycett and Gowlett 2008). These are stones that were flaked on two opposing surfaces in such a manner that a generally ovate- or teardrop-shaped plan form, and symmetry or near-symmetry about two planes, was produced (Figs. 1 and 2).

Handaxes are of particular interest to Paleolithic archaeologists, as they appear to be the first artifacts in the human cultural record to display characteristic hallmarks of intentional design. That is, to many – but not all – observers, they seem to have been deliberately shaped by hominins into particular tool forms (Wynn 1995).

The term handaxe was first used in a teleological sense to describe flint bifaces found in deeply stratified gravel quarries and clay pits in mid-nineteenth-century France and Britain (Prestwich 1860; Evans 1872). These curiously shaped stones, first described in the published literature a half century earlier (Frere 1800), occurred alongside extinct fossil fauna. Early French scholars named them *haches* (axes) or *coups de poings*, the latter meaning "blows of the fist," from which originated the English term handaxe (Debénath and Dibble 1994). The eventual acceptance of handaxes as humanly made artifacts (Prestwich 1860) provided the earliest scientific proof of the great antiquity of humankind. The first handaxe assemblages brought to the attention of nineteenth-century science were recovered from the St Acheul gravel pits of northern France. Thus, the entire time period of handaxe manufacture is often referred to as the "Acheulean" (alternative spelling: Acheulian) and the objects themselves as Acheulean handaxes.

Present evidence suggests that handaxe technology first arose in Africa ~1.76 Ma ago and had spread into western Asia and Europe by ~1 Ma ago. In the preceding Oldowan period, it is argued, stone toolmaking was less advanced from a technological, and also a cognitive, perspective. Dating to at least 2.6 Ma ago, African Oldowan assemblages constitute the earliest known evidence of stone technology. They

Handaxes and Biface Technology, Fig. 1 Acheulean handaxes from Middle Pleistocene Britain. Scale bars are in 10 mm increments. (Photos: A. Brumm; the artifacts are in the collections of the British Museum; used with permission)

typically contain few if any standardized artifact forms and are dominated by unretouched flakes and a limited range of relatively amorphous core types (i.e., choppers, discoids, core scrapers, and polyhedrons). Oldowan artifacts were made from almost any locally available raw materials, regardless of quality, and making them required little advanced planning and minimal investments of time and energy.

In light of this, it is often contended that the appearance of handaxes in the archaeological record reflects a major leap forward in hominin cognitive abilities, in particular, the emergence of the human capacity to impose preconceived forms on the environment – a possible precursor to language (Wynn and McGrew 1989; Wynn 1995). The intuitive impression that handaxes are over-engineered for functional purposes has led some to conclude that they reflect an incipient understanding of geometry and mathematics, perhaps even a sense of the aesthetic.

Recent findings from Ethiopia indicate the persistence of handaxe technology, in essentially unchanged form, until as recently as ~100 thousand years ago (Lycett and Gowlett 2008). This extraordinarily long time span implies that handaxes were associated with multiple hominin species, including *Homo erectus/ergaster*, *Homo heidelbergensis*, and early *Homo sapiens*.

The vast time-space distribution of the Acheulean has led some scholars to call it the most widespread culture in human history. However, others have questioned the extent to which handaxe technology represents a real tradition. As Clark and Riel-Salvatore (2006: 37) point out, for instance:

> . . .there is simply no behavioral or cultural mechanism by which a hypothetical tool-making tradition could be transmitted over hundreds of thousands of years and millions of square miles. So, whatever the Acheulean is, it is manifestly not a "culture" or "tradition."

Some archaeologists have also challenged the long-held theory that handaxes were products of an intended design ("finished artifacts"), a point returned to below.

Handaxes and Biface Technology, Fig. 2 Schematic model showing the technological features of a handaxe. Flakes were typically removed from around the bifacial platform edges and towards the center of each face, creating a generally radial or sub-radial (i.e., centripetal) scar pattern (modeled after concepts in Boëda 1995)

Definition

Handaxes are technically bifaces. A biface is any piece of stone that has been worked by a toolmaker on two opposing surfaces (i.e., *bifacially*) (Fig. 2), while a bifacial technology is the culturally embedded suite of technical practices and know-how employed by the toolmaker to do so. Bifaces and bifacial technology are ubiquitous in the prehistoric and recent archaeological records. They are present in the world's oldest known stone tool assemblages, from the African Oldowan. There are also many ethnographic accounts of bifacial tool making by modern human groups.

Most Acheulean assemblages contain varying proportions of bifacially flaked stones. Paleolithic archaeologists classify these bifaces into two distinct categories: bifacial handaxes and bifacial cores. The conventional view of Acheulean bifacial cores is that hominins set out to remove sharp-edged flakes from them, which were used as tools. With Acheulean handaxes, on the other hand, bifacial knapping was done with the conscious aim of shaping the biface itself into a tool.

Accordingly, with Acheulean core reduction, it is assumed that only the flakes removed from a core were important to hominins – the resultant core was discarded as waste. With handaxe reduction, however, it was the *final form* of the biface

that was of greatest interest to hominins – the flakes produced in the process of handaxe manufacture were merely unwanted rubbish. The fundamental difference between core and handaxe reduction in Acheulean technology, therefore, according to received wisdom, is that cores were the incidental *by*-products of bifacial reduction, whereas handaxes were the desired *end* products of this process.

Most present-day archaeologists define Acheulean handaxes using a fairly polythetic set of characteristics. "Typical" handaxes comprise large (>10 cm in length) bifaces with a generally pointed or ovate plan form, acute and often finely retouched cutting edges extending around part or all of the outer perimeter, slender tips opposite thick, globular butts, and, most characteristically, approximate bilateral symmetry around the long axis. While not all handaxes are symmetrical, and indeed, asymmetrical specimens are the norm in most assemblages, some display high degrees of bilateral symmetry in plan outline, cross section, and profile (but see below).

Allometric scaling is also seen as a defining characteristic of handaxes. Several studies have shown that Acheulean bifaces occur in similar size ranges across time and space, indicating standardization. Gowlett (2009), for example, uses the analogy of modern screwdrivers, which show similar uniformity in dimensions. He suggests that some handaxes, like screwdrivers, were intentionally worked into specific sizes and shapes for use for particular purposes.

Handaxes were manufactured on cobbles, nodules, or large flake blanks, the latter in some cases being struck from specially prepared cores. The earliest handaxe assemblages were made using hard-hammer percussors, resulting in deep flake scars, sinuous bifacial platform edges, and a generally "crude" appearance. Some Middle Pleistocene handaxes, however, appear to have been made using soft-hammer percussors of antler, bone, or wood. The use of soft-hammer percussion is thought to imply a concern with controlling the reduction of three-dimensional volumes by removing thin, expanding flakes, resulting in shallower scars across the surfaces of the tools, permitting more careful shaping and refinement of the overall form.

It has often been argued that handaxe reduction – from initial raw material procurement through to the various sequential phases of manufacture – was complex and multistaged, implying careful planning ahead in the production of the tools. Gowlett (2009), for example, argues for flexible planning in handaxe production routines. He maintains that the fact that the same product (a handaxe) could be made from three distinct blank types (nodules, flakes, and cobbles) provides strong evidence that the artifacts were deliberately designed.

Cleavers and picks are other kinds of large Acheulean bifacial tools that are morphologically distinct from handaxes but often tacitly subsumed within this category. Cleavers are bifaces, usually made on large flakes, with an unretouched distal edge oriented in a perpendicular or slightly oblique direction to the long axis of the blank. Picks comprise large, thick, retouched tools with high-backed plano-convex or triangular cross sections and robust pointed tips.

It is generally assumed that handaxes were used for a wide range of purposes – indeed, they have been called the "Swiss Army knife of the Stone Age." Although experimental studies emphasize their role as butchery tools, many different functions have been inferred, ranging from missiles lobbed at animals to objects of sexual display (Kohn and Mithen 1999). Few residue or microwear analyses of archaeological specimens have produced unambiguous evidence of handaxe function, however.

Whatever Acheulean handaxes were used for, it is unlikely that they functioned as axe-like implements. The term is so deeply embedded in Paleolithic studies, however, that its continued use is largely a matter of convenience, although many prefer alternative appellations like large cutting tool (LCT) or biface.

By definition, "true" bifacial handaxes only occur in the Lower and Middle Paleolithic periods. It is important to emphasize, however, that there are no attributes of Acheulean bifaces that are chronologically unique. Virtually any

technology in which tools or cores were produced by bifacial flaking could result in the discard of objects resembling handaxes (Brumm and Moore 2012). Indeed, there is a long history of scholars mistakenly attributing bifaces produced by modern humans, such as "Neolithic" bifacial axe blanks, to the Acheulean (see, e.g., Johansen and Stapert 1995). Despite frequent assumptions to the contrary, therefore, bifaces found in undated surface contexts cannot be used as a reliable source of dating evidence, for example, to designate a surface site with handaxe-like bifaces as Acheulean.

Key Issues

As noted above, the standard interpretation of Acheulean handaxes holds that, prior to the appearance of these objects, hominins did not shape stones into preconceived forms. One of the most pressing issues in our understanding of handaxe technology, therefore, is a simple but fundamental question: were handaxes really intentionally shaped tools? That is, were handaxes made according to fixed designs that guided the planned actions of toolmakers, or is the appearance of complexity in these artifacts merely fortuitous? The standard story relies on the accuracy of the assumption that the forms of handaxes were, indeed, deliberately imposed, so this is clearly an important problem.

Iain Davidson argues that it is impossible to know what was going on in the minds of hominins when they made stone artifacts, so it is a fallacy for us to presume to know which artifacts were intended for use as *tools* and which were not. Indeed, Davidson (2002) suggests that handaxe shapes could well have resulted from the same underlying processes that produced bifacial cores. Contrary to popular belief, the target of hominin reduction may have been the *flakes* removed from handaxes, which were useful as tools, rather than the handaxes themselves. In other words, handaxes might have been leftover by-products of flake manufacture (i.e., *cores*), and handaxe symmetry may be merely an "accidental" outcome of the flake removal process.

Clark and Riel-Salvatore have offered a similar interpretation of handaxes as cores: "If such is the case, the formal convergence that is so much a part of lithic reduction everywhere would have produced [handaxes] simply as an accidental consequence of centripetal flaking of large, relatively flat, oval cobbles and flakes" (Clark and Riel-Salvatore 2006: 38). Shea further supports this viewpoint, stressing the extent to which preconceptions about handaxes bias our understanding of them:

> The "handaxes as cores" hypothesis may seem implausible if one's impression of these artifacts is shaped largely from illustrations in the archaeological literature. These illustrations are biased in favor of large, thin, symmetrical and carefully flaked artifacts. However, such "trophy specimens" are almost always a minority of the bifacial core tools in any substantial Acheulean assemblage. Most such tools are short, thick, asymmetrical and with exactly the kinds of deep and invasive flake scars that result from flake production (Shea 2006: 221).

Iain Davidson takes this argument a good deal further:

> Hand-axes look alike because archaeologists select for analysis objects that look like hand-axes. There are objects in Acheulean assemblages that have some of the characteristics of hand-axes, but not all. These are excluded from comparison, reinforcing some of the appearance of standardization (Davidson 2002: 193).

Shannon McPherron has put forward an alternative, and somewhat less extreme, hypothesis. He believes that, even if handaxes were tools, rather than cores, morphological patterning in the artifacts need not imply cognitive intent. Handaxes, McPherron (2000) points out, were often "resharpened" by successive generations of bifacial removals from around the periphery. This was done in order to get maximum use out of the tools. The process of rejuvenating tool edges in this way reduced the mass of a handaxe and modified its overall form.

If such was the case, it is possible to imagine how an individual handaxe could have varied in shape at different points in its "life history," as a result of resharpening. Indeed, McPherron has argued that certain recurring handaxe shapes

routinely interpreted by archaeologists as purposefully designed tool forms – namely, ovate and pointed handaxes – might be arbitrary points along a morphological continuum. In fact, his analyses imply that ovate handaxes might simply have been pointed handaxes that were intensively resharpened.

This leaves open the possibility that the unresharpened forms of handaxes reflected elements of conscious design. The chief implication is that morphological complexity in handaxes, including handaxe symmetry, may be largely due to chance, rather than the deliberate intent of hominins to impose these forms on stones.

The idea that Acheulean handaxes were simply worn-out cores is difficult – if not impossible – to verify empirically, but no less so than the more orthodox view that handaxes were deliberately shaped tools. Proof of either notion requires observations of hominin behavior that the archaeological record, so far, cannot provide.

Handsman, Russell G.

Susan A. Johnston
Anthropology Department, George Washington University, Washington, DC, USA

Russell G. Handsman is an archaeologist working in the northeastern United States. After receiving his PhD from American University in 1977, he worked for a series of organizations, including the

American Indian Archaeological Institute, the University of Rhode Island Program in Public Archaeology, the EcoTarium Center for Environmental Exploration, and the Mashantucket Pequot Museum and Research Center (MPMRC). His research interests range from the origins of capitalism in New England (Handsman 1981) to the archaeological study of ancestral homelands and their long-term histories (Handsman 2008a). While most of his research has focused on New England, he has also contributed to archaeological thought in other areas (e.g., Handsman 1991a, 2015a). Handsman often takes a Marxist approach, applied to topics such as critical archaeology, gender studies, and the tensions between document-based knowledge of the past and archaeology. This can be seen in his work on issues such as race (2015b, 2008b). He has called for an archaeology of "Our Times", the years between 1900 and 1935, in order to challenge conventional history (1995), and has used documentary sources to develop an archaeological approach to the study of Wampanoag Indian whaling and maritime communities (2011). Most recently, he has focused on the issue of Native American "survivance," a concept developed in the social sciences to emphasize the creative participation of indigenous peoples in the survival of their cultures in colonial situations (e.g., 2013). Overall, what has united Handsman's research is an interest in challenging uncritical assumptions about the past and in documenting the resistance and survival of groups whose histories are often ignored.

Major Accomplishments

In addition to his research interests, Handsman has always maintained a commitment to considering the place of archaeology in everyday society. This includes support of reburial, the rights of indigenous people, and the involvement of descendant communities in archaeological research. While at the University of Rhode Island, native people were included in designing research projects and employed in field work. At the MPMRC, Handsman carried out a cooperative project between the center and the Zuni Tribal Nation and also explored the use of technology in encouraging museum visitors to go beyond the first exhibits encountered in museum spaces. He also conducted a hands-on archaeological field project incorporating local 6th grade students in New London, CT. This combination of innovative archaeological ideas, meticulous and hypothesis-based research, and a commitment to the larger community makes Handsman one of the most interesting archaeologists currently working in historical archaeology.

Hanse Archaeology

Natascha Mehler
Leibniz-Institut für deutsche Schifffahrtsgeschichte, Deutsches Schifffahrtsmuseum Bremerhaven, Bremerhaven, Germany
Institute for Northern Studies, University of the Highlands and Islands, Kirkwall, Great Britain

Introduction

The Hanseatic League was a medieval organization of mainly North German merchants aiming to represent their common interests and to secure their trading operations abroad. To this end, traders got together to trade via networks from the mid-twelfth to the seventeenth centuries. However, they were not a uniform group of German merchants but rather an association of traders from several different areas, representing trading towns in various countries and arranged in several different quarters. Over the course of the Late Middle Ages, the Hanseatic League became the largest economic power in northern Europe. It was also highly significant from a political, social, and cultural point of view, both in its core area and its peripheral regions.

The Hanse is no longer a mere domain of (economic) history. For more than 60 years, it has also been subject to archaeological research. The scope of the so-called Hanse Archaeology (or Hanseatic Archaeology) is now as international as the Hanseatic League itself was in its days.

Definition

To put it simply, Hanse Archaeology investigates the history of the Hanseatic League with archaeological methods. With regard to its content, Hanse Archaeology has both a narrow focus, concerned mainly with analysis of the intercultural exchange between the Hanseatic merchants and their agents (e.g., seamen, craftsmen) and their customers abroad, and a wider focus, which studies the social, economic, and cultural impact these contacts had. Hanse Archaeology thus has a different emphasis from Hanseatic history, which has traditionally been concerned mainly with questions of economic and political history. The reasons for this dichotomy lie largely with the different sources. The written records that have survived deal mainly with various aspects of the movement of goods, thus providing more detailed insight into this area, while the archaeological sources shed more light on facets of everyday life, which are only rarely, if at all, mentioned in the written records.

Thanks to the equal treatment and inclusion of written and pictorial sources, Hanse Archaeology can be considered a case study in the field of Historical Archaeology (Gaimster 2005: 408). It studies artifacts; biofacts; architectural remains in towns and rural areas, coastlines, and their hinterlands; port facilities; ships; and commercial routes, thus also forming an area of Maritime Archaeology.

Geographically, Hanse Archaeology operates over a very wide region, both in the core areas of the Hanse, i.e., the major Hanseatic towns in present-day northern Germany (Lübeck, Wismar, Stralsund, Bremen, Hamburg, etc.), and in the many subsidiaries (e.g., Bergen in Norway, Turku in Finland, Gdansk in Poland) and their surrounding areas.

The concept of Hanse Archaeology originated with David Gaimster (1999) and his research on the Hanseatic League throughout the Baltic. However, archaeologists were studying the Hanse much earlier, without identifying it explicitly as a distinct field of research. All the medieval or early modern excavations which have been regularly carried out, at least since the 1960s, in the core towns of the Hanse such as Lübeck, Bremen, or Hamburg, can also be associated with Hanse Archaeology in its wider scope. Moreover, archaeological methods have long been used to study the history of the Hanse in northern European towns like Bergen, which held great importance for the Hanse.

It is important to point out a linguistic detail: the German language differentiates between the adjectives "hansisch" and "hanseatisch." While "hansisch" denotes everything associated with the medieval and early modern Hanse, "hanseatisch" is a more recently coined term referring solely to the three towns of Lübeck, Bremen, and Hamburg, still called Hanse towns to this day, and their inhabitants. The English language does not make this distinction, and the adjective "Hanseatic" can also be used to denote the medieval and early modern Hanse.

Methods

Today, Hanse Archaeology operates in a very interdisciplinary manner. The methods used vary greatly, however, from project to project and depend ultimately on the funding available. Besides the archaeological sources, written records are another important source category, tying Hanse Archaeology closely in to the fields of history and economic history. Written records are an ambiguous data source, however. Customs records or toll registers tell of goods exported and imported, but they do not mention all the items shipped. Pottery, for example, is hardly ever listed as ship's cargo, though it was widely exported from the German coastal cities to the north and into the Baltic and is found in many excavations (Fig. 1). Many written documents are concerned with political issues or disputes between traders and the authorities. Everyday or personal matters, on the other hand, are very rarely mentioned. The archaeological record is difficult too. Often, sites are only partially excavated and the interpretation of the artifacts discovered is difficult. Also very important are pictorial sources, such as portraits of merchants or images of ships or ports identified by name, or simply material culture depicted in contemporary still lives (Fig. 2). Sixteenth and seventeenth century maps help identify small Hanseatic trading bases, as do place names and even oral history, e.g., farmers talking about ruins on land which have been in their family for generations. Best results are achieved when written, archaeological and pictorial sources are discussed and interpreted together. In cases where an archaeological excavation takes place, all the usual archaeological and scientific methods are applied.

Hanse Archaeology, Fig. 2 The Hanse merchant Georg Gisze (1497–1562), painted in 1532 by Hans Holbein the Younger. Georg Gisze was a merchant from Gdansk, Poland, and is shown here in his office at the Steelyard in London. Gisze imported fish, probably from Iceland, using Hamburg vessels; having sold the fish in London, he brought cloth back to Hamburg. On the table sits his official stamp, consisting of a bone handle and a metal seal matrix. (From Mehler 2009, Fig. 7)

The latter include, in particular, archaeobotany, archaeozoology, and paleoentomology, as well as dating methods such as radiocarbon dating or dendrochronology. The latter is particularly important in determining the age and even the origins of timbers recovered from shipwrecks. Hanseatic wrecks and their cargoes are investigated and recorded applying the usual methods of underwater archaeology, and some are actually salvaged.

Historical Background

The term "Hanse" has been known since the twelfth century. It originated from the Old High German word "hansa," meaning roughly "band" or "community," and denotes both a group of traveling merchants and the charge which was due for membership of such a community. In a third meaning, the term "Hanse" additionally denotes the legal right to carry out communal commercial enterprise (Hammel-Kiesow 2004: 27).

The Hanse came into being in the mid-twelfth century. There is no exact date or event linked with its formation. However, the rise of Lübeck in the mid-twelfth century, giving access to the Baltic Sea, is considered to have been one of the decisive elements in the formation process, since it meant that Western Europe could now trade with Russia, by navigating the Baltic and the rivers Dnjepr and Volga, and reach as far as the Caspian Sea (Dollinger 1970: 19; Fehring 1989: 61; Hammel-Kiesow 2004: 21–22).

This early organization of merchants, which can be traced back to 1160, is called the Merchants' Hanse (*Kaufmannshanse*). An important role in its inception was played by the Gotland Community (*Gotländische Genossenschaft*), a society of merchants which had formed in Lübeck. At that time the island of Gotland acted as the most important commercial hub. While trade with the Baltic region and Russia had previously been dominated by the Scandinavians, the Hanse merchants now took over the leadership (Dollinger 1970: 24–26; Hammel-Kiesow 2004: 30; Wubs-Mrozewicz 2013: 4–14).

Several pan-European political and social changes in the mid-thirteenth century resulted in the Merchants' Hanse evolving into the Hanse of the Towns (*Städtehanse*). During the Interregnum (1245–1273) in the Holy Roman Empire, the imperial protection which had previously been enjoyed by the merchants was lost. They found new protection in the towns, which now ensured the safety of trading routes and the maintenance of trading privileges. The towns formed alliances and organized so-called *Tagfahrten* or *Hansetage*, Hanseatic Diets, where envoys from the towns assembled in order to regulate their trading interests. All the resolutions were recorded in the so-called *Hanserezesse* (Hanse legislative records). The first Hanseatic Diet at which representatives of all the Hanse towns met took place in 1356. The Hanse of the Towns lasted from around 1250 to the early fifteenth century, and this period is considered to have been the heyday of the Hanse (Dollinger 1970: 45–85, 92–97;

Hammel-Kiesow 2004: 71–73; Wubs-Mrozewicz 2013: 4–14).

With the discovery of the New World, the Hanse increasingly lost its importance. Trade had shifted, and in addition powerful competitors began to enter the market. Moreover, the towns were now increasingly forced to subordinate their interests to the ruling princes. Sixteenth century attempts at reorganizing the Hanse failed. By the early seventeenth century, the Hanse was a union only in name. The final demise eventually came with the Thirty Years' War (1618–1648). In 1669, Lübeck held the last Hanseatic Diet, with the participation, however, of only a small number of towns (Dollinger 1970: 281–370; Hammel-Kiesow 2004: 97–115).

Geographically, the Hanse's main area of activity was enormous. The core area comprised the towns of the so-called Wendish Quarter, including Lübeck, Wismar, Rostock, Stralsund and Hamburg (all in Germany), and Visby (in present-day Sweden). Trade was pursued principally in the Baltic region and took in important towns of the so-called Baltic Quarter, such as Gdansk (Poland), Riga (Latvia), or Tallinn (Estonia). In the west, towns of the Westphalian Quarter such as Deventer and Groningen (both in the Netherlands) were of great importance (Dollinger 1970: map 3).

A major aspect of the Hanseatic League was its role as the predominant agent for the transport of goods from east to west, south to north, and north to west in northern Europe during the late medieval and early post-medieval periods. The weights and measures used throughout the Hanseatic trade region, while not identical, were at least sufficiently compatible to allow business to run smoothly. However, direct trade between the points of supply and the final destinations of goods was rare. Instead, goods were usually transported in several stages within the Hanseatic network (Dollinger 1970: 210–250), a factor which makes interpreting the distribution of archaeological artifacts somewhat problematic.

Long-distance trade was largely conducted via four so-called *Hanseatic kontors*, trading enclaves abroad, within which the merchants had formed associations with the aim of advancing their interests. Moreover, kontors were also legal communities endowed with privileges. The merchants and their retinues usually lived in these kontors all year round. The easternmost and oldest Hanseatic kontor was the so-called *Peterhof* in Novgorod, Russia, a fenced area within the city which had come into being in the mid-thirteenth century. St. Peter's Church stood at its center and was surrounded by residential buildings, shops and storage sheds, a bakery, a brewery, an infirmary, and a jail. The kontor in Bruges, Belgium, was the most important Hanseatic kontor in economic terms. It had been founded around the mid-fourteenth century. A short while later, the so-called *Tyske Bryggen*, the kontor in Bergen, Norway, was founded. In its heyday, it comprised around 30 farmsteads on the northern side of the Vågen Bay. It is estimated that some 2000–3000 Germans lived in Bergen during the summer months in the fifteenth and sixteenth centuries. However, Bryggen was not an isolated German ghetto but operated in vibrant interaction with its surroundings. The so-called *Steelyard* in London, the final kontor, was a fenced-in area on the northern bank of the river Thames which existed from 1475 onward (Dollinger 1970: 85–116; Hammel-Kiesow 2004: 61–64).

History of Research

Hanse Archaeology as a discipline is considerably older than its name. Two basic fields of research can be distinguished: the inward focus, which deals with the core region of the Hanse, and the outward focus, which looks at the contact areas abroad that were heavily influenced by the Hanse. Urban archaeology has long been pursued in many towns throughout the Hanseatic core region, essentially making a contribution to Hanse research, without, however, actually stating this or asking specific questions about the history of the Hanse. Strictly speaking, almost every inner-city excavation carried out since the Second World War in, for instance, Lübeck or Gdansk, which has uncovered late medieval or early modern remains, has provided information on the Hanse. After all, at that period many inhabitants of these towns were involved in the operation of

the Hanse in some capacity or other. Besides the merchants, this included, first and foremost, the numerous craftsmen, who made the trade in goods possible in the first place. At the end of the fourteenth century, it is estimated that approximately half of the population of Lübeck, to give just one example, were pursuing occupations connected to the harbor and shipping (Fritze 1998: 113). During the high and late medieval periods, Lübeck had grown considerably, and this development went hand in hand with the emergence of a merchant class in the town. Economic and demographic growth in Lübeck is reflected by the repeated subdivision of large plots and the change in architectural style from wooden constructions to brick-built houses with several stories (Fehring 1989). In the case of Lübeck, the results of these archaeological investigations have been published in the series *Lübecker Schriften zur Archäologie und Kulturgeschichte* since 1978. Moreover, the town hosts regular conferences on urban archaeology in European Hanseatic towns, whose proceedings have been published in the series *Lübecker Kolloquium zur Stadtarchäologie im Hanseraum* since 1997.

Archaeological research into the Hanseatic kontors abroad also has a long-standing tradition. Since 1932, excavations have regularly been taking place in Novgorod, uncovering an impressive number of excellently preserved timber finds. The results have been presented to European readers in the series *The Archaeology of Medieval Novgorod* (Brisbane and Gaimster 2001). Comprehensive excavations have also been carried out in the area of the German Brygge in Bergen. After a large conflagration in 1955, the remains of several timber buildings which had made up the Hanseatic kontor were excavated over the course of 15 years. The buildings were both post and log constructions and had storage areas on the ground floors, while the living quarters were located on the upper stories. The excavations were also an important milestone in the evolution of a European Archaeology of the Middle Ages. Besides the architectural remains, the emphasis of the published post-excavation reports has to date focused on find categories such as pottery, shoes, textile remains, and fishing equipment. The results of these, and of new excavations carried out more recently, have been published in *The Bryggen Papers, Main Series* and *The Bryggen Papers, Supplementary Series* since 1985.

In contrast, significantly fewer studies of Hanse Archaeology have so far been produced in Bruges or London. An example from London was the excavation carried out in the grounds of the Steelyard complex (1988–1989). It revealed stone walls which had been preserved up to a height of 1.4 m and had belonged to the Guildhall of the Cologne merchants (Keene 1989) (see Fig. 2).

In the 1990s, archaeological research into the Hanse began to be carried out in the Baltic coastal states. Here, too, the main emphasis has been on the study of material culture, primarily pottery. A good example is the research into the Hanseatic pottery trade in the Baltic. Western European ceramic products, especially tableware and interior fittings for buildings, were imported, adapted, and even imitated in order to emulate the Hanseatic urban lifestyle (Gaimster 1999, 2005). Later, in the early 2000s, archaeological research into the Hanse also started to include the North Atlantic islands such as Iceland, Faroe and Shetland and thus moved into the margins of the Hanseatic trade area (Mehler 2009; Mehler and Gardiner 2013).

Key Issues/Current Debates

Archaeological Hanseatic research, including both fields of research mentioned above, concentrated for a long time on the core region of the Hanse and on the Baltic trade. In this it followed the lead of Hanseatic historical research, which has traditionally concentrated on this area. While until the 1990s the main focus of archaeological research was analysis of material culture, more recent research has increasingly studied sociocultural questions. This line of approach was initiated by David Gaimster's work, which for the first time discussed the impact of the imported goods and the ongoing presence of foreign merchants on local societies, how the Hanseatic and the local cultures approached each other, and whether

assimilation occurred on the part of the local population, among the Hanseatic merchants, or perhaps from both sides (e.g., Gaimster 1999, 2005). He concluded that there was a distinct Hanseatic culture, which manifested itself mainly in the lifestyle of the urban bourgeoisie. Tangible evidence for this culture is gleaned from archaeological analysis of artifacts like stove tiles or tableware such as serving and eating vessels, which were often made in the Rhineland or northern Germany and widely exported throughout the Hanseatic trading area. When a purchaser at a Finnish market bought, for example, an item of Siegburg stoneware, he was expressing a wish to share the lifestyle that his purchase represented (Gaimster 1999, 2005). This line of approach follows the general trend of no longer viewing artifacts as mere indicators of trade but as carriers of cultural and ideological content.

Gaimster's concept of an explicitly Hanseatic culture and the methods he uses to identify such a culture have since been discussed, as has his perspective, which views the evidence largely from a Hanseatic point of view, thus assigning too passive a role to the local societies within the process of cultural exchange. In recent years, various researchers have questioned whether such a Hanseatic culture really existed, asking how it would be defined if in fact it did exist (e.g., Suhonen 2001; Immonen 2007; Müller 2013), and which archaeological methods would allow us to make such cultural interpretations (Mehler 2009). Müller (2014: 445) has reminded us that – while focusing on researching the Hanseatic cultural impact on certain areas – we should not neglect to take into account processes such as urban transitions of that specific area that existed parallel to those economic and cultural processes stimulated through Hanseatic connections.

Recent studies in the North Atlantic, such as Iceland, Shetland, and the Faroe Islands, investigate the interactions of Hansards with insular societies, thus including the peripheral regions of the Hanseatic area of influence, which were characterized by rural societies rather than urban centers (Mehler 2009). This stands in stark contrast to the investigations of Hanseatic influence on the urban bourgeoisie in the Baltic region, where large numbers of people from what is today Germany had settled in many of the late medieval towns. In Turku in Finland, these made up more than half of the population around 1400 (Immonen 2007) (Fig. 3). Many German

Hanse Archaeology, Fig. 4 The so-called Bremen cog, built after 1380, on display at the German Maritime Museum at Bremerhaven. (Photograph Wolfhard Scheer)

merchants and seamen also lived on the islands in the North Atlantic during the summers. However, they did not stay in towns but in small remote trading posts, which often consisted of just one to three buildings and served clients within a radius of up to 50 km (Mehler and Gardiner 2013).

The research in the North Atlantic is connected to that of the European westward expansion, which began in the fifteenth century and subsequently extended to the New World. The enterprises run in these islands, mainly by merchants from Bremen and Hamburg, were under great pressure from competition by Dutch and English merchants, of whom the latter eventually moved their business to the New World and founded colonies. In consequence, archaeological research in this area, as well as the Baltic, has been influenced by postcolonial theory. In both areas the Hanse has been discussed as a proto-colonial force (Immonen 2007: 729; Mehler and Gardiner 2013). With Germany celebrating the 500th reformation anniversary in 2017, the role of the Hanseatic trade and towns for processes of religious identity formation abroad has been investigated. Lutheranism spread to Scandinavia and the Baltic through Northern German towns such as Lübeck and Hamburg. Archaeologists studied the role of ceramic objects such as drinking vessels or stove tiles with protestant imagery, their distribution through Hanseatic networks, and what their use can tell us about their former owners (e.g., Ring 2013). Such aspects of the study of confessionalization keep the debate about the Hanse as a proto-colonial, or even colonial force alive. New approaches have also been pursued in Hanseatic underwater archaeology. Since the 1960s, several examples of ships thought to be cogs, a type of ship which came to be symbolic of the Hanse, have been found. Famous examples include the so-called Bremen cog (Fig. 4), which was built in 1380 and found on the bottom of the river Weser near Bremen, and the Mollö cog, built in c. 1365 and found off the west coast of Sweden. It has since become clear, however, that reconciling the features uncovered with the ship types mentioned in the written records is fraught with difficulties. The written records only provide information about loading capacities and goods rather than details about the construction of the ships (Weski 1999). Many ship finds are now being critically reevaluated. The Mollö cog, for instance, exhibited technical details characteristic of Scandinavian shipbuilding. As more old finds are critically reevaluated, the boundaries between Hanseatic and Scandinavian shipbuilding techniques appear to be progressively dissolving. This is a reflection of a significant exchange of shipbuilding skills throughout northern Europe, which went hand in hand with a considerably

increased international trade in the Late Middle Ages (Crumlin-Pedersen 2000; Zwick 2017).

International Perspectives

The earlier studies within Hanse Archaeology, in particular, were heavily focused on local interpretations. In addition, some countries tended to use Hanse Archaeology as a reflection of nationalistic views of history. In Norway, for instance, Hanseatic archaeological research is only carried out in Bergen, although so-called factories or trading posts also existed in Oslo and Tønsberg, which were also important for the Hanseatic trade.

Inner-city excavation teams in northern Germany and Poland have so far put very little effort into searching for wares imported from the countries of trading partners (e.g., fish) or analyzing the products created by their craftsmen for influences from other countries. It is therefore difficult to gain insight into the potential interaction between the Hanseatic traders and their partners abroad.

Icelandic researchers have to date viewed Hanseatic trade merely as a prelude to the Danish trade monopoly (1602–1786), while the Shetland Islands see their Hanseatic past in a rather positive light, since the takeover of trade by Scotland in the wake of the Act of Union in 1707 plunged Shetland into an economic depression, whereas the Islands had prospered during the Hanseatic period.

For the past 10 years approximately, Hanse Archaeology has attempted to free itself from such nation-centric thinking. Hanseatic trade is now being viewed and interpreted against the background of broader historical movements, and international perspectives are being developed. Moreover, a paradigm shift is becoming noticeable. While in many parts of northern Europe Hanseatic traders and their agents used to be viewed as colonialists, who exploited the native populations, such interpretations are now being criticized for their all-too-simplistic definition of colonialism. At first sight, Hanseatic trade appears to exhibit all the traits of simple colonial relationships between the economic powers of northern Europe. However, the asymmetry of economic power that this seems to suggest is not borne out by the actual relationships between the Germans and their clients abroad. The type of interaction between the Hanseatic merchants and their overseas customers is viewed as proto-colonial (Immonen 2007; Mehler 2009: 89; Mehler and Gardiner 2013). It was this economic interaction in the peripheral regions of Europe that eventually formed the basis of the northern European expansion into the New World. In this sense, Hanse Archaeology may be seen as a northern European contribution toward archaeological colonial research, a core subject of Historical Archaeology.

Future Directions

Hanse Archaeology has clearly evolved in its focus, particularly over the past decades. International and interdisciplinary research cooperation, mainly between archaeologists and historians both from the core region of the Hanse and from the countries with which it traded, has proved indispensable. Although Hanse Archaeology is headed in the right direction in this respect, more attention must nevertheless be paid to the written records. The archaeological results are still too often presented without their historical context. On the other hand, it is essential that Hanse historians also take into account the results of archaeological work, to be included in their discussions and interpretations. Frequently, analyses of archaeological and written sources come to different conclusions, and it is necessary to evaluate all available data (Hammel-Kiesow 2014). Furthermore, art historians have since long investigated fine arts produced in workshops of Hanseatic towns and the cultural and social implications of their trade within Northern Europe (e.g., Petermann et al. 2017). Hanse Archaeology has been slow to engage with such studies but it will do so in the future.

Harappan Burials of Kalibangan

Satarupa Bal
Department of AIHC and Archaeology, Deccan College Postgraduate and Research Institute, Pune, India
Assistant Archaeologist, Archaeological Survey of India, New Delhi, India

Introduction

As archetypal as it would seem, burials emerged as a peculiar behavior among living beings and may be traced from the times of the hominids. We are, in today's world, so well accustomed to the idea of burials that we tend to forget the peculiarity and the circumstances which led humans to start burying the dead. With the progress from the phase of prehistory to protohistory and emergence

of the prodigious Harappan Civilization, we perceive burials as a customary practice. Though, existence of other methods of disposal of the dead, alongside burying the deceased, is quite a possibility. As a highly complex society develops, we see innovation and its application in all phases of human activity, the influence of which demonstrates in the tradition of burial of the dead also, which is our prime focus here. The Harappan Civilization, also called the First Urbanization in the cultural history, imbibed in itself a well-structured and disciplined society under the benefaction of central administration, with well-planned cities and houses, flanked with methodically built bathrooms, drainage systems, etc., market places, platforms of social interactions, separately marked townships for the ruling and ruled classes, mercantile activities, trade and craft, textile and other flourishing industries, etc. The cities that were protected with fortification walls and bastions had their burial mounds usually outside the city limits, at a distance, which was of course to avoid contamination of the drinking water supply systems and storage houses. Such was the well-planned administrative and social control of this civilization.

Key Factors/Analysis

In congruence of the above details, it is already known that the complex society at Harappa had understood the importance of hygiene, alongside their respect and reverence for the dead. However, an understanding of the ways and methods applied for burying the dead is to be developed in order to deduce the complexity of cognitive aspects of the society. We come across in almost all the sites of the Harappan Civilization, or the Indus Valley Civilization, as was called earlier, that the mode of disposal of the dead varied in variance of age and gender, and in most cases we sometimes come across elaborate burials dedicated to an individual of the same gender while a simplistic one for the other. An understanding of child burials may also help answering some questions related to the cognitive aspects of the society.

This brings us to explore the basics of the Harappan Civilization, the extent and the causes of its flourishing traits, before we finally understand the site of Kalibangan, through its burials, and how it may enlighten us on the fundamentals of understanding a burial tradition and culture of a typical Harappan site. The identification of the Harappan Civilization in the early twentieth century pushed the beginning of settled life in the Indian subcontinent by 2000 years. Documentation of the three phases of Harappan culture – Early Harappan (3300–2600 BC), Mature Harappan (2600–2000 BC), and Late Harappan (2000–1700 BC) – suggests a gradual cultural process of origin, development, and disintegration. A recent research done by the Woods Hole Oceanographic Institution explains the reasons for the disintegration of this cultural process to be climatic fluctuations, among other possible factors. The Civilization extends from Baluchistan in the northwest to Alamgirpur in the east and Jammu and Kashmir in the north to Daimabad in the south. Mehrgarh was a pre-Harappan neolithic site that saw the dawn of food producing era. The Mature Harappan Civilization was a culmination of Bagor, Hakra, and Kot Diji traditions or "ethnic groups" in the Ghaggar-Hakra valley on the borders of India and Pakistan, and these composed the Early Harappan phase or the formative period of the Harappan Civilization.

Fire altars, Kalibangan, Rajasthan

Kalibangan has provided the six fabrics of Early Harappan pottery that serve as a marker

for identification of ceramics of the regionalization phase of the civilization. The southern half of the citadel had ceremonial platforms and fire altars. Fire altars were also built in public dwellings where a room was apparently earmarked for them. This typical example leads archaeologists to suggest a prime position of the site of Kalibangan in an early chronology of the civilization in the Indian subcontinent. Burials, though, do not seem evident from the early age, from excavations till date, from the site of Kalibangan, specifically, according to the excavator. It is pertinent, therefore, to analyze the traditions, whatever can be drawn from the excavated burials, in order to elucidate the social life of the habitants of Kalibangan, literally meaning *black bangles*, something that we find on the surface of the mound, strewn in large numbers.

The archaeological site of Kalibangan is situated on the left bank of Ghaggar, in the district Sri Ganganagar of Rajasthan. The site revealed around 12 phases of Harappan habitational deposit. This is validated to 4040 ± 105 and 3165 ± 110 by 14c dating, hence marking the Mature Harappan deposits to a timespan from c. 2600 to c. 1900 B.C. Excavations conducted in this site from 1960 to 1969 revealed the Harappan phase cemetery. The burial ground, which is located 300 m west-southwest of the western mound, is a flat hard ground area flooded by the Ghaggar River in the rainy season every year. No evidence of practice of burial has been found in the Early Harappan phase context from this site. It has time and again been confirmed by archaeologists that the burials of Putti Seman, Bedwa, Sanauli, etc. belong to the Late Harappan period, while those of Kalibangan, Rakhigarhi, Tarkhanwala Dera, and Farmana belong to the Mature Harappan period. An overview of the burials of Harappan culture would denote to an area, away from the habitation site; facing any of the definite cardinal directions; besides following specific orientation of the body and body parts, again, in certain fundamental directions, that were different for different regions; well-off female burials, quite similar to most burial sites of the Harappan culture; coffin and brick-masonry burials in certain cases; use of ample number of potteries to emphasize a belief in life after death; etc. Though the mode of disposal of dead in usual Harappan burials forms a precise pattern, Kalibangan provides two other types of burials inclusive of the usual extended burials. They may be categorized as pot burials in circular pits and rectangular or oval pits with pottery deposits. Areas have been demarcated for the different types. The pot burial area is to the north of the extended burial area, whereas the rectangular or oblong pits (which are devoid of skeletal remains) are in the extended burial area. The extended human burials and pot burials were first located and documented by Prof. A.K. Sharma in 1963–1964. The rectangular pot burials were excavated and documented by Shri K.S. Ramachandran.

Location of Kalibangan, Rajasthan, India

Out of the 88 extended burials, 16 groups were plotted by the excavator, which have been then assigned by him to a certain group of people or family. Each of such group contained eight to ten burials. It is a well-established fact that the Harappans planned their burials quite scrupulously. The burials would undeniably be located away from the residential complexes, and in this case (the site of Kalibangan), it is even away from the sacred/religious area that is marked by several fireplaces or altars (KLB-3).

The mortuary practices adopted in the burials of the site follow certain sociological and ritual norms. Pits were dug in proper and uniform

proportions and laid with hard speckled brownish clay. The skeletons were kept in supine position, head toward north, provided with usual grave goods of potteries and antiquities. Apart from the usual pattern followed in Harappan-type burials, deviation from it can also be noticed in some of the burials with deceased people of either unnatural death or rich burials. In a particular case, the body was placed on platters so that it did not touch the ground. A grave contained three skulls and disarticulated bones, which may have belonged to people involved in an accident which had resulted in mutilation of body parts, making it difficult to detect definite individuals.

Now, if we investigate the general distribution of the skeletal remains in the extended burial type area, it can be noticed that the average height of the inhabitants ranges from 1.75 m to 1.55 m in males and from 1.55 m to 1.45 m in females. Most of the skeletons provide an upper age limit of 60 years, generally coming under the middle age category. Though child burial has also been found, the molar of a child in a relic casket in one of the burials was an interesting find. Mostly, the skeletons are laid in a supine position in a north-south orientation, with certain amount of deviation sometimes. Sometimes, the position of hands and legs may have been altered due to certain pathological conditions. These pathological deformities, which can be observed in some of the skeletons, include paralytic conditions, crippling, exostosis, hydrocephalic conditions, etc. Other than that, example of death caused by accident is also confronted with.

A general study of the skeletons, looking into the female, male, and child burials as separated subjects, may bring up new issues, which we shall take up herein. We shall look into the sociocultural aspect for detailing these burials, in order to build a societal framework of these departed Harappans of Kalibangan, as has been termed by the excavator.

Three female burials have been encountered with, numbering Skeleton Nos. 1, 4, and 8. Apart from the former, the other two are in a north-south orientation. Skeleton No. 8 shows deviation from the normal laying pattern of skeleton. Its head is toward south, in a crouched position. It indicates a paralytic case. The deviation from the usual ritual of placing the body north-south with head toward north, that is seen in this case, may be due to the clinical deformity (since it is a paralytic case). The placement of pots is also not definite. Some are placed to the south, near the skull, while the others are toward the feet of the skeleton to the north. Skeleton No. 4 seems to be a much sophisticatedly demonstrated burial. It contains a woman of absolute significance probably, as can be suggested by the substantially rich grave offerings. 20 pots and a copper mirror may point out to the elegance of the female, supposedly, to take care of herself even in the afterlife. Bowls and jars, along with cup-on-stand and beakers, form the majority of the pottery offerings, suggesting the disposal of eatable cutleries along with the burial, good enough to store food and beverage for the afterlife. Skeleton No. 4 was however not so well served as compared to the richly offered Skeleton No. 8, with only regular pots and bowls and a dish-on-stand. Another difference that can be noticed is that the richly adorned burial is that of the adult female, while the scarcely disposed burial is that of the teenager. Skeleton No. 1 too belongs to an adult female. It has variant offerings, ranging from potteries which serve as the ones to offer food and water to antiquities like beads, bangles, and gamesman. Such a custom as to a minimal disposal of burial offerings for an adolescent and lush offerings for adult females, as in this case, might have been practiced. Though, evidences from other sites also need to be investigated to prove this point. If we look at the burials of Rakhigarhi or Farmana, for that matter, the two Harappan sites in proximity that have yielded burials, we can find similar treatment to female burials. Burial No. 1 of RGR 7 of the burial mound in Rakhigarhi, for example, is that of a female, who possessed shell bangles, gold and stone beads, miniature gold armlet reminiscent of a fillet, varying arrangement of pots, etc. Another female burial bears evidence of shell bangles and a necklace of 408 micro steatite beads embedded around her skull and neck, a very first example. All these burials comprise of brick-masonry burial structures, while the adolescent burial encompasses mostly pots and a hopscotch,

but no antiquarian remains or stonework structures. The very recent DNA study of Rakhigarhi burials also points to the fact of an ancestry gradient that was widespread in farmers to the northwest of Peninsular India at the height of the IVC that had very less genetic contribution from Steppe pastoralists or western Iranian farmers or herders and that had a primary impact on the ancestry of later South Asians. Kalibangan Burial No.29 shared many features (grave structure, votive pots, and prone-positioned posture) with Rakhigarhi grave A2/BR33, according to the excavator. The similar finding was also reported at Harappa, the type site of the Harappan Civilization in Pakistan. A report from a seventh century Anglo-Saxon cemetery indicates that a real bed had been put in the grave, not a platform made of soil and pots, and that the individual had been a high-ranking female. Although the discovery of similar burials has been very rare to date, the possibility that such a funeral custom might have been followed over a much wider area cannot not be ruled out. Farmana, another necropolis, similar to the Harappan culture in the Indian subcontinent, has revealed three different types of burials from the mature Harappan levels, namely, primary, secondary, and tertiary burials. This site has also, equally, revealed certain burials, belonging to prominent social strata, as seen in the case of Kalibangan and Rakhigarhi, having given ceremonious burial, in accordance with his status, being observed from the number and variety of pots and other antiquarian remains in the form of grave goods. Even the child burial, one belonging to an affluent high strata of the society, bore evidences of plentiful classical Harappan potteries.

Coming back to the site of Kalibangan, let us now observe as to how child burials play an effective role in providing inputs in the mortality rate and the social beliefs of the people. The child burial, Skeleton No.3, had a condition of hydrocephaly and had to undergo trephination or surgical incisions in the skull to drain out accumulated fluid to release enlarged brain. The child was buried with utmost care, along with small pots, bowls, and beaker to carry food and water for afterlife. Placement of the pots in close proximity to the mouth of the skull suggests the affection of the persons burying the child, so that the child would not be deprived of necessities on the way to its heavenly abode. Another burial containing the molar of a child in a relic casket also contains an adolescent and an adult, all of whom may have died in an accident and hence buried together. This grave is also substantially laid with offerings of pots and other antiquities. Though in this case too, as seen in the previous child burial, small vase and medium-sized pots are seen, probably meant especially for children. The terracotta ball, found among the offerings, must have been a toy item that belonged to the child. The affection of the kins can be judged herewith.

The male burials are probably the richest of the deposits, after the extravagant female burial with Skeleton No. 4. All the male burials consist of an array of a large number and variety of potteries. Noteworthy are the abundance of shell ornaments, namely, shell bangles and earrings along with the skeletons. Etched and banded beads are also found. The male population seems to be very particular about their get up in those times. All types of pots ranging from serving dishes to beverage containers are found in abundant numbers. The most profligately furnished burial is the one with Skeleton Nos. 11 and 7. The former has not less than 70 plain and painted potteries, which depict human and animal motifs. The body is also laid on the potteries, another typical custom seen to be followed in this site. The latter is the richer one, with a number of varieties of beads along with gold beads too. Potteries include the usual variety, though a globular vase with thin red slip and "early Harappan Fabric A" has been found. An evidence of the continuation of usage of the early period pottery is hence seen here. Or it may be suggested that this person may have been the resident of the site for a long duration of time and hence been honored with a sherd of bygone days that may have been kept as a prized possession. No other "early Harappan fabric" sherds have been encountered within any other burial group in this site.

Discussion

The mode of disposal of the dead brings out the typical Harappan traits. Uniformly dugout pits in the same hard speckled soil with the same filling characterize the burial pits. An interesting feature can be derived from Skeleton Nos. 1 and 2. The former has its skull on a higher level than the pelvic region, while the latter is its reverse. A very simple explanation that can be derived from this is that the floor may have been dug unevenly. If this possibility is ruled out, another explanation that might seem to fulfil the cause may be that Skeleton No. 2 had an exostosis in its right ulna. The bend formed due to the pathological deformity might have been the reason for the lowering of the body above the pelvic region, as opposed to Skeleton No. 1 which has its upper body on a higher level than the lower. All the other skeletons that have been buried directly over the scooped out burial pit or floor covered with a layer of the filling material, the one burial of a male aged 55–60 years approximately, has been placed on an array of pots and the skull and the upper body parts on plates. This might have been an attempt to signify the importance of the person buried in the aforesaid manner, with a layer of plates beneath his upper body and an extravagant arrangement of 70 pots in two groups, both to the north and to the center of the pit. Not only do the preparation of floor for certain bodies denote importance of the individual, but the absence of a prepared floor with either potteries or the filling material may also indicate the fact that sometimes the mortuary ritual may have been a hurried endeavor. As we see in the Vedic times as well as in recent burial rituals, a definite period is discernible to bury or cremate the dead, which is regarded as an auspicious time period. Certain *mantras* are chanted to lead the soul of the dead on its way to heaven with pleasant memories of their life and a well-being for their "afterlife," as has been found from verses of Rigveda (no. 10.16, 10.18, etc.). This would become sometimes an extensive affair. Hence, to keep track of time, much attention might not have been given to the preparation of the burial. This might have been the case with Burial Nos. 35 and 36, to the south and northeast corner, respectively, of Burial No. 7, which had been disturbed by the latter. According to the excavator, *possibility of getting tibia, fibula, and foot bones cannot be ruled out* after the clearance of the filling. The same filling comprises Burial No. 36 too, though a similar explanation for the rich man's burial, i.e., Skeleton No. 11, was definitely not a capricious one. A lot of resources and time had been invested probably to pay homage to the dead, since a bed of plates were arranged for the laying down of the upper part of the body along with painted pots of human and animal motifs. Also, the usage of Harappan bricks of dimension 1 × 2 × 4 with plaster of *chunam* may also be involved in a significant person's burial imbibing certain ritualistic purpose. An attempt to provide a warm place for the deceased to feel comfortable in the afterlife was looked into while preparing the burial chamber by the kins. Such a compact environment may also have been instrumental in the longer storage of food offerings and protection of the dead body from scavengers.

Potteries, as can be seen from the previous example of a richly decorated burial, are a vital factor to categorize the wealth and prosperity of a certain individual or a group of inhabitants. Beginning with the number of pots, the types of pots placed along with the painted motifs and fabrics indicate the cognitive aspect of the kins in the process of mortuary practice. A chieftain obviously deserves a well-equipped and lavish farewell than a layman or his subjects, hence accounting for his pottery-laid deathbed, consisting of painted ones as well, and a casket to differentiate the status of the departed.

The usual practice of placing pots, mostly toward the northern end of the pit and in the vicinity of the skull, was mostly followed. However, pots were also found either all over the burial chamber or pit and sometimes in the middle of the pit or toward the feet of the dead. Such practices may relate to multifarious rituals being performed for each group of potteries

placed in different locations of the burial pit. Different types of pots may signify different purposes in relation to the mortuary practice performed. A plate or a bowl or a dish-on-stand or dish might have contained food offerings, whereas a *lota*, jars, cup-on-stand, and goblets might have contained water or some other liquid substance for usage by the deceased in afterlife.

Apart from the extended burials, the pot burials and the rectangular or oblong burials were extravagantly furnished with pots but devoid of skeletal remains. They may have provided a symbolic burial for the deceased who might have lost his/her life in a certain accident or in a voyage from which they never could return probably. Hence a burial, in memorial of the lost relatives, was constructed to pay homage to them. Sometimes disarticulated bones in the extended burial pits can signify persons mutilated in warfare or attack. Though, the possibility of war seems to be a far-fetched possibility in the site of Kalibangan. According to the excavators, no weaponry has been unearthed from the site which could indicate the maintenance of a garrison by the central administration who exercised control over the entire habitational area.

Availability of antiquities like shell bangles, shell earring, carnelian beads, jasper and agate beads, gold beads, etc. in the ear, wrists, and neck region signifies the ornamental taste of the females of the Kalibangan population. A copper mirror may indicate a stage of affluence in the livelihood of the people and advancement in science and technology in the early periods of human habitation along the Ghaggar. Gamesman, terracotta ball, etc. provide an insight of the recreation methods, whereas bone points may indicate the existence of techniques followed in prehistoric times for certain works of piercings and hunting. The minimal number may indicate a reduction in the usage of prehistoric tools in this phase of human history.

After the analysis of data from the burial report of Kalibangan, it may be confirmed that only the listed skeletal evidences do not account for the entire population of the site. Hence other modes of disposal of the dead were definitely in practice during those times. A definite mode of mortuary practice was laid down as norm to be followed by the population which was practiced meticulously by the inhabitants.

Harris, David Russell

Martin Jones
Cambridge University, Cambridge, UK

Basic Biographical Information

David Harris is a leading authority in research into human ecology and agricultural origins. He was born in 1930 in London, England, and in 1950 commenced study of geography at Oxford University and in 1955 leading to a master's thesis entitled Water Resources and Land Use in

Tunisia. His growing interest in environmental diversity and the varied history of human land use took him to the University of California at Berkeley, where he engaged with the work and ideas of Carl Ortwin Sauer. His Ph.D. (1963) thesis entitled Plants, Animals, and Man in the Outer Leeward Islands, West Indies: An Ecological Study of Antigua, Barbuda, and Anguilla was the first of the many projects conducted during his career which took an ecological-historical approach to human land use.

After periods of lecturing at both Berkeley and London, in 1964 he took up a readership in geography at University College London. In 1980 he was appointed Professor and Head of the Department of the Human Environment, at the Institute of Archaeology in London. He served as Director of the Institute from 1989 to 1996 and retired in 1998. He served as President of the Prehistoric Society from 1990 to 1994 and of the UK Chapter of the Society for Economic Botany from 1995 to 1997. Among several honors and awards, he was elected Fellow of the Society of Antiquaries and Fellow of the British Academy and presented by the Royal Geographical Society in 1972 the Back Award for contributions to biogeography.

Major Accomplishments

Harris has been a significant authority in the fields of agricultural origins and the historical ecology of human land use and has also published on the history of archaeology. Two seminal publications (Harris and Hillman 1989; Harris 1996) served to extend the discourse of agricultural origins and spread beyond the conventional centers of origin, thus promulgating a truly global approach to human ecological history that researchers around the world have followed. Many earlier studies of the genesis of farming had placed a strong emphasis on a core set of classic centers of agricultural origin. The two publications above both extended the conceptual range of engagement with economic species and the geographical and ecological range of where its history could be explored.

The first of these publications also marked an early episode in the long-standing collaboration between Harris and the renowned archaeobotanist Gordon Hillman (also at the London Institute of Archaeology). That collaboration led to groundbreaking work at such sites as Tell Abu Hureyra in Syria (Harris and Hillman 1989) and Jeitun in Turkmenistan (Harris 2010). Their research with Victor Masson at Jeitun and sites in the surrounding region constitutes a key Central Asian study in human ecological history, providing some of the earliest indications of agricultural practices in Central Asia (Harris 2010). Over the course of his career, Harris's explicitly global approach has taken him to each of the world's continents to conduct field research. In addition to the Eurasian projects mentioned above, he has undertaken research projects in New Guinea, the Torres Strait, Africa, and Central America. His works have drawn attention to the diversity of ecosystems in the human past from which economic plant tissues of some sort have been harvested and have stimulated the diversification of archaeological method to trace these ecologies accordingly.

Throughout his career, Harris articulated and developed an explicit ecosystem-based approach to the human past (cf. Harris 1969; Harris and Thomas 1991), which has been particularly influential in the novel foci of research into agricultural origins, such as the tropical regions (Harris 1971) and arid/savannah regions (Harris 1980, 1984).

Hastorf, Christine

José M. Capriles
Department of Anthropology, The Pennsylvania State University, University Park, PA, USA
Instituto de Investigaciones Antropológicas y Arqueológicas, Universidad Mayor de San Andrés, La Paz, Bolivia

Basic Biographical Information

Christine Ann Hastorf (born December 7, 1950) is a North American archaeologist specializing in paleoethnobotany, agriculture, prehistoric lifeways, and pre-Hispanic and contemporary Andean communities. She was born in Hanover, New Hampshire, USA, and attended Stanford University where she received her B.A. in Human Biology (1972) and the University of California, Los Angeles, where she obtained both her M.A. (1977) and Ph.D. (1983) in Anthropology under the supervision of Timothy K. Earle. Following graduation, she took an appointment at the University of Minnesota, where she worked for the next 10 years, and from where in 1994, she was recruited as a tenured professor by the University of California, Berkeley. She is currently full Professor in the Department of Anthropology, Director of the McCown Archaeobotanical Laboratory, Director of the Archaeological Research Facility, and Curator of South American Archaeology of the Phoebe A. Hearst Museum of Anthropology at the University of California, Berkeley. Christine Hastorf has directed and participated various field and lab research projects and mentored and trained numerous cohorts of undergraduate, graduate, and postdoctoral scholars from various backgrounds and nationalities.

Major Accomplishments

Christine A. Hastorf is part of a generation of archaeologists who have successfully extended the impact of archaeology and expanded its breadth beyond disciplinary boundaries by broadly collaborating with social anthropologists, architects, biochemists, geologists, paleoecologists, and plant scientists, among many others. Arguably, her most significant contributions have been in the field of paleoethnobotany, a subdiscipline, which she has helped to reach its present maturity (see Hastorf and Popper 1988). Hastorf has been a prolific scholar and often pioneered addressing a wide range of questions using a diverse array of theoretical and methodological approaches, from the fundamental questions surrounding the evolution of agriculture to the technological and interpretative challenges of using different recovery, identification, and analytical procedures, from the changing use of fuel preferences in relation to resource depletion to the impact of climate change on agricultural practices, and from the sociopolitical impacts of dietary changes to the long-term development of culinary traditions. As an example, her work on the social impact that the increased consumption of maize (mainly as *chicha* or fermented corn beer) brought about by the Inca conquest of the Xauxa highland

communities is an often-cited example of how archaeology can ask and address complex research questions (see Hastorf 1991).

Hastorf's contributions have also been significant for explaining the spread of key significant New World cultigens including maize (*Zea mays*), quinoa (*Chenopodium quinoa*), potatoes (*Solanum tuberosum*), chile peppers (*Capsicum* spp.), and coca (*Erythroxylum coca*), among many others. Yet, she has not limited the scope of her research to plant-human interactions as she has also contributed significant work to the discussion of a broad range of topics not limited to ancient and contemporary sociopolitical integration, the constitution of meaning in everyday life, social memory, style, gender, and improving the preservation conditions of archaeological sites and collections by working with local communities (e.g., Arnold and Hastorf 2008; Conkey and Hastorf 1993; Hastorf 2006).

Most of her research has been centered in the archaeology of Andes, particularly the upper Mantaro River valley in the highlands of central Peru (Hastorf 1993) and the Taraco Peninsula in the Lake Titicaca basin of Bolivia (Hastorf 1999), where she has directed extensive research projects. Nevertheless, she has also collaborated with archaeologists from and working in most Latin American countries. Furthermore, she has designed and implemented the plant recovery paleoethnobotanical protocol of the excavations at Çatalhöyük in Turkey (Atalay and Hastorf 2006).

Christine Hastorf has been indicated in various prestigious societies and organizations including the California Academy of Sciences and the Society of Antiquaries. She has also received multiple awards and recognitions for her contributions to advancing anthropological and scientific knowledge including the 2012 Fryxell Award for Excellence in the Botanical Sciences in Archaeology granted by the Society for American Archaeology.

Finally, Christine Hastorf has an innate curiosity and discerning interest in solving often unconventional research questions using novel approaches. She is always earnestly interested in learning about other people's work, and her insights are helpful and provocative. She has helped archaeology extend its influence and significance by genuinely pushing its epistemological boundaries in terms of theory but also methods and practice.

Haua Fteah Cave

Graeme Barker
McDonald Institute for Archaeological Research, University of Cambridge, Cambridge, UK

Introduction

The Haua Fteah (22°3′5″E/32°53′70″N) is a large limestone karstic cave situated about a kilometer from the present-day coast of Cyrenaica, northeast Libya, at the foot of the northern escarpment of the Gebel Akhdar ("Green Mountain") massif (Fig. 1). In the course of three seasons of fieldwork (1951, 1952, 1955), Charles McBurney (University of Cambridge) excavated a trench ~14 m deep in the center of the cave's interior (Fig. 2). The excavations revealed a succession of sediments associated with evidence of human activity (stone tools, animal butchery waste, etc.) believed to represent a more or less continuous sequence of human occupation from the present day back to at least 80,000 years ago (McBurney 1967). This sequence has remained unparalleled in the region, and most subsequent research on North African prehistory has referred to McBurney's discoveries and interpretations. Renewed excavations directed by Graeme Barker (University of Cambridge) began in 2007 and are continuing.

Definition

During McBurney's excavations, sediments were removed in horizontal spits, and stratigraphic layers were then defined from the trench walls as the excavations proceeded downwards. These layers were divided into seven cultural phases, principally on the basis of changes in the stone tool assemblages. Eighteen radiocarbon (^{14}C) dates on charcoal gave indications of date for the upper layers, from the present day to the then-limits of the method c. 40 ka BP; lower down, ages were estimated from assumptions about rates of sediment deposition (Table 1).

Phase A was a flake and blade industry categorized as a "Pre-Aurignacian" Middle Paleolithic similar to Pre-Aurignacian and Amudian assemblages in Southwest Asia. This was succeeded (Phase B) by "Levalloiso-Mousterian" industries broadly comparable with Middle Paleolithic industries in the Levant and Europe. Two human mandibles in Layer XXXIII were categorized as "Neanderthaloid." Phase C consisted of an

Haua Fteah Cave, Table 1 Major phases of occupation defined at the Haua Fteah by McBurney (1967); the Middle Paleolithic was further subdivided

Phase	Layers	Cultural designation	Estimated age ka BP McBurney (1967)
A	From base of deep sounding to XXXV	Libyan Pre-Aurignacian	80–65
B	XXXIV–XXV	Middle Paleolithic	65–40
C	XXV–XVI	Dabban (Upper Paleolithic)	40–15
D	XV–XI	Eastern Oranian (Final Paleolithic)	15–10
E	X, IX	Libyco-Capsian (Mesolithic)	10–7
F	VII–IV	Neolithic of Libyco-Capsian tradition	7–4.7
G	III–I	Historic	4.5 to present

industry characterized by the preferential selection of blanks for the production of blades and with an artifact range similar to that of the European Upper Paleolithic Gravettian, termed the "Dabban" by McBurney after the Cyrenaican cave of Hagfet ed-Dabba where he had found similar material (McBurney 1960). The Dabban was succeeded by a microlithic late or final Upper Paleolithic industry (Phase D) termed the Eastern Oranian or Iberomaurusian from its similarities with assemblages in the Maghreb (northwest Africa), and this was succeeded (Phase E) by a microlithic Mesolithic-type industry with parallels to Capsian assemblages in the Maghreb and, hence, classified as the "Libyco-Capsian." The final prehistoric occupation (Phase F), with Neolithic pottery and domestic sheep and goats, was termed "Neolithic of Libyco-Capsian tradition" because of similarities in stone tools (e.g., the frequency of backed pieces) with the preceding Libyco-Capsian. This was capped (Phase G) by a substantial boulder-supported structure dating to the Graeco-Roman period (Layers III, II), covered by burnt animal dung and other evidence of animal stalling dating to recent centuries (Layer I). The cave is still used for stalling sheep and goats, and similar deposits continue to accumulate.

Key Issues

The McBurney excavations were remarkable in their scale, and the subsequent analyses of the material were pioneering for their time (McBurney 1967), but subsequent research on North African prehistory raised questions about the sequence, its age, the character of the various phases, and the explanations proposed for changes between them – McBurney generally favored population replacement to account for lithic changes. For example, sedimentary and faunal signatures of wetter climates in the basal sediments were interpreted by Moyer (2003) who suggest that they might in fact be far older than McBurney realized, dating between marine oxygen-isotope stage (MIS) 5 and MIS 7, c. 195 ka. McBurney regarded the blade-based Dabban industry as the evidence for the arrival of modern humans (Upper Paleolithic, in the European sequence), but the Pre-Aurignacian also contained a significant number of blades and burins, and evidence of shellfish collection which McBrearty and Brooks (2000) identified as a potential signature of modern human behavior in Africa, whilst bioanthropological analysis indicated that the two human mandibles in the Levalloiso-Mousterian layers were fully modern human (Hublin 2000), so the sequence raised major questions about when modern humans first arrived and what the technological changes represented by the Dabban and the subsequent three microlithic industries (phases D–F) signified in terms of behavioral changes and/or population changes. Questions like these were the context for the renewal of archaeological fieldwork at the site by the Cyrenaican Prehistory Project in 2007.

In the course of five seasons of fieldwork, the CPP has removed the backfill deposited in the

Haua Fteah Cave, Fig. 3 The CPP excavations in the Haua Fteah: (*left*) part of the north-facing section of the Middle Trench; the visible holes are the locations of OSL tubes; scale in.5 m divisions: (*right*) looking across the McBurney trench to a new excavation (Trench M); the second plywood sheet to the *left* of the standing figure covers the part of the trench wall shown in the *left* image; the north-facing and east-facing walls of the Holocene sediments in the Upper Trench are visible in front and to the *right* (compare the latter with the same face in 1955: Fig. 2, *left*). (Photographs: G. Barker)

McBurney trench at the end of the 1955 season; cleaned and recorded the original sections (which are well preserved, with many of the original aluminum labels still in place) using the single-context system; removed two 30 × 30 cm column samples of sediment from the cleaned faces for sedimentological and palynological analysis; and is in the process of excavating a new 2 × 1 m trench down the profile to provide new data about the sedimentary and cultural sequences, and the climatic and environmental contexts, in which they developed (Barker et al. 2007, 2008, 2009, 2010, 2012; Fig. 3). A suite of dating methods (^{14}C, OSL, ESR, tephra) has provided a new chronology that has greatly refined the McBurney chronology for phases B–F, indicates that initial occupation began c. 130 ka (the start of OIS 5), dates the layer with the human mandibles to 74.6–69.3 ka, and dates (including with a clear stratigraphic relationship to Campanian Ignimbrite tephra) the start of the Upper Paleolithic Dabban industries to 46–41 ka, approximately contemporary with the appearance of Early Upper Paleolithic industries in the Levant and southern Europe (Douka et al. in review). The Oranian began c. 17.5–16.6 ka BP, the Capsian c. 13–12.3 ka BP, and the Neolithic c. 7.4–6.9 ka BP.

The dating program has been integrated with palaeoclimatic investigations using sediment micromorphology, palynology, vertebrate faunal and molluscan assemblages, and isotope studies of mammal teeth, marine molluscs, and land snails. Despite sediment transport and reworking, sedimentary facies have been defined which correlate well with OIS climate stages 5–1. Archaeological investigations of materials from the new excavations include studies of lithic technologies, microwear, and residues; vertebrate fauna and molluscs; and carbonized plant remains; and these are being integrated with new studies of materials from the 1950s excavations archived in the Museum of Archaeology and Anthropology, University of Cambridge. This work is being combined with geoarchaeological survey and palaeoclimatic studies across the Gebel Akhdar.

The first human activity at the site cannot definitely be linked to modern humans, in that the only fossils are in a Levalloiso-Mousterian layer, but the fundamental similarities between the Pre-Aurignacian and Levalloiso-Mousterian industries

suggest that this is highly likely. Interesting, the modern humans at the Haua Fteah are not associated with Aterian industries as in the Maghreb (e.g., Barton et al. 2009; Scerri 2012). It is argued that modern humans first spread into North Africa across the Sahara in MIS 5, when wetter climates created major lakes across what is now desert (Drake et al. 2011), but in the case of the Gebel Akhdar, movement westwards from Egypt and/or the Levant may be as likely. Given the evidence of contemporaneity in the appearance of blade industries at Haua Fteah, the Levant, and southern Europe, it is unwise to assume that the Dabban is necessarily evidence of population movement from the Levant into North Africa. There is evidence for increasing aridity through the later Dabban and Oranian phases of occupation, but although the use of the Haua Fteah was highly variable in its intensity and seasonality, the indications are that the Gebel Akhdar was an important refugium at this time for animals, plants, and people. In the Early Holocene, Capsian people practiced broad spectrum subsistence, and this continued alongside animal herding in the Neolithic – there is no definite evidence for plant cultivation in the Neolithic. The cave was used for stabling livestock in the Graeco-Roman period, and there is evidence of significant impacts on the landscape around the cave from ploughing and cultivation (Hunt et al. 2010). The new work at the Haua Fteah suggests that the remarkable succession of human occupation in the cave first revealed by Charles McBurney's excavations will continue to remain seminal for the study of North African prehistory.

Haverfield, John Francis

Anthony Barrett
Department of Classical, Near Eastern and Religious Studies, University of British Columbia, Vancouver, BC, Canada

Basic Biographical Information

John Francis Haverfield (1860–1919), distinguished British classical scholar and archaeologist, was born in Shipston-on-Stour, Worcestershire, and educated at New College, Oxford, where he took a degree in Literae Humaniores (Classics) in 1883.

After graduation, he became a schoolmaster at Lancing College in Sussex, where he pursued research on various aspects of classical antiquity, publishing articles on classical authors and also on Roman epigraphy. His work on the latter led to contacts with Theodor Mommsen (1817–1903), who invited him to complete and refine Emil Hübner's volume 7 of the *Corpus Inscriptionum Latinarum*, containing the inscriptions found in Britain. In 1892 Haverfield was invited back to Oxford and appointed initially to a fellowship at Christ Church and later (1907) to the Camden Professorship of Ancient History. He then entered upon the most fruitful and productive phase of his career, with a focus on the history and archaeology of Roman Britain. He was constantly called upon to make progress reports on ongoing fieldwork and was closely associated with a number of important excavations, although he was never the formal director of any of them. Notable among his publications were his contributions to the *Victoria County History* series, where he wrote the chapters on the Roman period of a number of counties. His work was curtailed by a stroke in 1915. He died 4 years later.

Major Accomplishments

Haverfield gained recognition as the foremost authority on Romano-British history and in a very real sense was responsible for the discipline of Romano-British studies becoming a component of the university curriculum. He saw Britain as a province within a greater empire, and his great achievement was to redefine the study of that province on scientific lines. He was particularly noted for his meticulous and disciplined classification and cataloguing of small finds. Before him, Roman Britain was largely the preserve of the amateur and the dilettante, for whom Haverfield had much contempt. Inspired by Mommsen, he applied rigorous scholarly standards and was particularly insistent on archaeology, professionally conducted, as an important element of history. His record of publication was prodigious, but sadly he did not live to complete a comprehensive history of Britain in the Roman period. His Ford Lectures, given in Oxford in 1906, were published posthumously by Oxford University Press in 1924 as *The Roman Occupation of Britain*.

Hawkes, Christopher

Christine Finn
Society of Antiquaries of London, London, UK
Flinders University, Adelaide, Australia

Basic Biographical Information

Charles Francis Christopher Hawkes was born in London in 1905. His family moved frequently during WW1, but in 1924 he began to read Classics at New College, Oxford, beginning a lifelong association with the university city. His potential was spotted, and he dug with Mortimer Wheeler and Nowell Myers, and on graduation in 1928, he joined the British Museum as an assistant keeper.

His first major book was a collaboration with his BM colleague, Tom Kendrick, *Archaeology in England and Wales*, 1941–1931, which "nourished generations of Cambridge archaeologists" according to the prehistorian Grahame Clark. He was briefly engaged, but in 1931 he met the promising young Cambridge archaeologist, Jacquetta Hawkes, when her tutor sent her to dig for him at the Roman site of Colchester. In 1933 they were married at Trinity College, Cambridge, where her father was a don. They had one child, Nicolas, born in 1937. Together they excavated sites in Southern England, and both were elected as Fellows of the Society of Antiquaries, Christopher in 1932. He wrote three papers on which the prehistorian Barry Cunliffe commented (Cunliffe 1991), who "totally altered the direction of thought on the Iron Age and paved the way for the next three decades of constructive study."

The pair continued their archaeology even as war was on the horizon; Christopher supervised the storage of artifacts from British Museum in the safety of the nearby Aldwych underground station. One of his most important works, *The Prehistoric Foundations of Europe*, was by then underway and, despite the difficult circumstances, was published in 1940. With Jacquetta, he wrote another well-received publication, *Prehistoric Britain*, published in 1943, which was his last book, although the academic papers continued. That year he was transferred to the Ministry of Aircraft Production where he remained there for the duration of the war, while Jacquetta served at the Ministry for Education, taking on the role of broadening the audience for archaeology. In 1946, Christopher returned to the British Museum. His academic specialization of Iron Age Britain was now within the context of rebuilding archaeology postwar. Within the year he was appointed the first professor of European archaeology at Oxford, and in 1948, a Fellow of the British Academy, on the recommendation of Gordon Childe. By the time Christopher moved his rooms at Keble College, Oxford, to take up his post, his marriage to Jacquetta was in trouble. Her affairs, with the critic Walter Turner and JB Priestley, who she married in 1953, were indicative of their very different characters, despite a shared passion for archaeology. Christopher's friends defended him, and many never forgave Jacquetta for breaking up the family. In 1959, Christopher, who craved a settled home life, was happily remarried to his research assistant, the Anglo-Saxon scholar, Sonia Chadwick.

Beyond his contribution to European archaeology, Christopher's influence on the discipline at Oxford was substantial. In 1961 he convinced the university to expand their teaching of the subject and to create an Institute of Archaeology, which still remains close to the Ashmolean Museum on its original site close to. His academic recognition continued into later life, and Diaz-Andreu, Price,

and Gosden (2009) suggested he was the originator of an Oxford school of protohistoric archaeology, comparable to Grahame Clark at Cambridge. The authors contend that in the early 1930s, Hawkes produced "three papers that were fundamental for the development of Iron Age studies," according to an analysis of Hawkes's extensive networks drawing on correspondence with professional and amateur archaeologists, in his papers at the Bodleian Library.

Christopher Hawkes held the chair of European archaeology until retirement in 1972. Christopher Hawkes died in March 1992; later that year Oxford began to admit the first undergraduates in the new joint honours degree of archaeology and anthropology.

Major Accomplishments

Professor of European Archaeology, University of Oxford
Fellow of the British Academy
Gold Medal, Society of Antiquaries of London

Hawkes, Jacquetta

Christine Finn
Society of Antiquaries of London, London, UK
Flinders University, Adelaide, Australia

Basic Biographical Information

Jessie Jacquetta Hawkes (nee Hopkins) also known as Jacquetta Priestley was born on August 5, 1910, in Cambridge, UK. Her father was the Nobel prize-winning biochemist and Trinity don, Frederick Gowland Hopkins, and her mother, Jessie Ann, introduced her to museums. After an early declaration that she wanted to be an archaeologist, in 1929 she was one of the first to read for the new Cambridge degree of archaeology and anthropology. She left Newnham College with a first-class degree and an invitation to dig with Dorothy Garrod at Mount Carmel in Palestine. Her experience there, exposing a Neanderthal skeleton, had a marked effect on her, and she returned to this discovery in her prose and poetry. By then she had met another promising archaeologist, Christopher Hawkes, both working on a Roman site near Colchester. In 1933 they married and began what appeared to be a union of mutual interests, with a home in North London. Their only child, Nicolas, was born in 1937, and their first book together, *Prehistoric Britain*, was published in 1943. By then Jacquetta had taken over the second volume of *The Archaeology of the Channel Islands* from her husband's British Museum colleague, Tom Kendrick. This 1938 monograph helped her academic recognition, and she was elected a Fellow of the Society of Antiquaries. *Prehistoric Britain* already evidenced the different ways Jacquetta approached the past. Her contribution is the more lyrical, a style which would define her as a poet as much as an archaeologist, most notably in the 1951 book, *A Land*. By the time of its publication, to excellent reviews from literary critics, Jacquetta and Christopher's troubled marriage was ending.

It was significant that Jacquetta Hawkes remained in London during WW2; Christopher was awarded the Chair of Prehistory at Oxford, but his wife did not move there with him. She remained in London and worked for the civil service, notably the Ministry for Education, where her role was broad and public and enabled her to share her love of archaeology widely. She scripted a film, "The Beginning of History" (1946), and began to be published as a poet, encouraged by the Australian poet and critic, Walter Turner, with whom she had an affair. Central to Britain's post-war culture, she widened her circle beyond traditional archaeology to include artists, philosophers, photographers, and poets. In 1943 she was made principal and secretary of the UK commission for a new cultural body, UNESCO. At a conference in Mexico City in 1947, she began an affair with the celebrated writer, JB or Jack Priestley. After two much publicized divorces, the couple were married in July 1953. During their life together – Priestley died in 1984 – Jacquetta Hawkes continued to introduce her beloved archaeology to as wide an audience as possible, including children, lectured widely, and was a regular contributor to BBC radio and television.

She coedited UNESCO's prehistory volume against a background of new scientific data and, in 1968, in a widely debated *Antiquity* paper, warned that archaeology risked being narrowed by scientific development. She was encouraged to write the biography of Sir Mortimer Wheeler but ultimately felt she was out of favor with traditional archaeology. In 1980, her most controversial book, *A Quest of Love*, in which she imagined herself as a woman over time, left her sidelined by many academics who had never forgiven her for leaving Christopher. Her last publication, with Paul Bahn, was a popular guide to British archaeology. By 1992, when Oxford University launched its own degree in archaeology and anthropology, her best-known books were out of print, and her substantial contribution to archaeology overlooked as it would continue for 20 years. Most recently, *A Land*, her most acclaimed work, has found a new audience among enthusiasts of nature writing. It was republished in the UK in 2012.

Meanwhile Jacquetta Hawkes's approach to archaeology is becoming known to a generation of contemporary archaeologists who actively seek an engagement with the personal past. I believe she personifies what I have come to term "creative archaeology" in which the processes of excavation, and investigation, are transformed into other artistic practices and forms. She died in Cheltenham on March 18, 1996. Her ashes were interred with JB Priestley's, and her archive is with his in Special Collections at the University of Bradford.

Major Accomplishments

Elected a Fellow of the Society of Antiquaries of London, 1940
Archaeology advisor to the Festival of Britain, 1951
Governor of the British Film Institute (BFI)
Coeditor, UNESCO *History of Mankind*
Cofounder, Campaign for Nuclear Disarmament (CND)
Vice-president, Council for British Archaeology
OBE, Order of the British Empire medal

Haynes, Jr., C. Vance

Vance T. Holliday
School of Anthropology and Department of Geosciences, University of Arizona, Tucson, AZ, USA

Basic Biographical Information

Vance Haynes' (1928–) initial training was in rocketry, engineering, and economic geology. He first attended Johns Hopkins University (1947–1949) but earned a B.S. in Engineering Geology at the Colorado School of Mines (1956). An early interest in human prehistory led to work with North American archaeologists studying the earliest occupations on the continent (Paleo-Indian archaeology). He joined the geochronology program at the University of Arizona and earned a Ph.D. in Geology (1965). With the exception of 5 years at Southern Methodist University (1968–1974), his career has been in Geosciences and Anthropology at the University of Arizona. He technically retired in 1999 but has maintained his research, producing several of his more substantive publications in the 2000s, including a magnum opus on Murray Springs (University of Arizona Press, 2007).

Major Accomplishments

Few North American researchers have made so many contributions to the archaeological sciences in so many different fields for so many years. His research includes site stratigraphy, environmental reconstructions, artifact typology and technology, and geochronology in both North America and North Africa. Very early in his career, he had the opportunity to combine a strong avocational interest in archaeology with his professional interest in geology. Through the 1960s and 1970s, he was one of the very few practicing geoarchaeologists in North America. Moreover, he remains one of the few geoarchaeologists in this country with both training and experience in the fundamentals and the subtleties of geology and archaeology. This background combined with careful, meticulous fieldwork allowed him to portray the physical environment in an archaeological context at both site-specific and regional scales. This work included investigations throughout the southwest, Great Plains, and midcontinental USA and in Egypt and Sudan.

Archaeologically, Vance has a long record of substantive contributions to the study of the peopling of the New World. His initial professional involvement in archaeology focused on the stratigraphy and geochronology of Paleo-Indian sites on the Great Plains. This work eventually included the southwestern USA. His fieldwork included a series of key sites: Clovis, Folsom, Lindenmeier, Hell Gap, Mill Iron, Lehner, and Murray Springs. Beyond site specifics, Vance has also produced a number of classic syntheses including a landmark 1964 paper in *Science* that first laid out a Paleo-Indian chronology based on careful application (mostly by him) of the then still relatively new radiocarbon method. He has since published a series of summary papers on the origins, paleoenvironments, and chronology of the Clovis and Folsom occupation of North America. Vance is also remarkably generous in sharing his experience and time with other Paleo-Indian specialists, traveling all over the continent (and down to South America) to view sites and collections and offer his advice.

Haynes' site-specific Paleo-Indian research, combined with his broad interdisciplinary interests, resulted in his classic publication on an "alluvial chronology" for the Great Plains and southwest (in the edited volume *Means of Correlation of Quaternary Successions*, 1968, University of Utah Press). He pursued this research throughout his career and is a leading authority on alluvial geoarchaeology. In working on alluvial chronologies, he sought to discover the driver of these apparently synchronic records (e.g., his paper on "Clovis Drought" in *Quaternary Research*, 1991). The result was a synthesis of his work on "black mats" (*Proceedings of the National Academy of Sciences*, 2008) which demonstrates the value of making such correlations. At the same time, Vance has always been careful

at detailing the stratigraphy at each of the sites on which he has worked. Further, repeated visits over the years to view new sections or apply new dating methods (e.g., the Clovis and Lindenmeier sites: *Denver Museum of Natural History Proceedings*, 1960; *American Antiquity*, 1966; *Ice Age Hunters of the Rockies*, University Press of Colorado, 1992; *Geoarchaeology*, 1995) helped refine Paleo-Indian stratigraphy and chronology. Though best known for his geoarchaeological work at Paleo-Indian sites in North America, his investigations span the late Pleistocene and Holocene and include stratigraphic studies at historic sites such as the Little Bighorn Battlefield.

Another major contribution by Vance Haynes is in the development and application of geochronological methods in both the geosciences and archaeology. Beyond simply applying the radiocarbon method, Vance has helped to develop many techniques. He built a lab at Southern Methodist University that always maintained a reputation for innovation and precision. Throughout his career, Haynes conducted pioneering research into the problematic issue of dating bone. In a 1971 paper (*Arctic Anthropology*), he was one of the first to realize that the calibration of the radiocarbon timescale for the late Pleistocene and early Holocene could have serious implications for understanding the Paleo-Indian chronology (over 20 years before the tree-ring and U-series/coral curve could be extended back that far). And he was one of the first and strongest proponents of careful application of the AMS radiocarbon method in archaeology (in the edited volume *Proceedings of the First Conference on Radiocarbon Dating with Accelerators*, 1978; *Archaeology of Eastern North America*, 1984).

Vance's career in North Africa began when he joined the Combined Prehistoric Expedition, directed by Fred Wendorf and Romuald Schild, drawing him into the Western Desert of Egypt where he became interested in the geoarchaeology of middle and late Paleolithic sites. In more than 40 papers on the Western Desert (or Darb el Arba'in Desert, as he named it), Vance delved into such diverse topics as the geochronology of playas, dune migration, and remote sensing of sand movement, Quaternary climate change, and the geomorphic evolution of the eastern Sahara (e.g., two papers in *Science* in 1982; *Quaternary Research* 1989). In his travels across the desert, he documented previously unknown Paleolithic sites and the historic camps of early desert travelers. And like his work on Paleo-Indian projectile points, Vance's research in the Western Desert touched the core of his many avocational interests, including military history and planetary geology.

In recognition of his many contributions to archaeology, geoarchaeology, geomorphology, and geochronology, Vance was presented with the Roald Fryxell Award of the Society for American Archaeology (1978), the Archaeological Geology Distinguished Career Award from the Geological Society of America (1984), election to membership in the National Academy of Sciences (1990), the Medal of Merit of the Egyptian Geological Survey (1996), and the Distinguished Career Award of the American Quaternary Association (2002).

Head, Lesley M.

Richard Fullagar
Centre for Archaeological Science, School of Earth and Environmental Sciences, University of Wollongong, Wollongong, NSW, Australia
Scarp Archaeology, Austinmer, NSW, Australia

Basic Biographical Information

Professor Lesley Head is an Australian geographer who grew up in Melbourne, Victoria, and completed her Higher School Certificate in 1974. She completed a B.A. (Hons) at Monash University in 1979 and her Ph.D. in 1984. She worked briefly for the Australian Bureau of Statistics, and as a tutor in geography at Monash University, before taking up a lectureship at the University of Wollongong in 1987. She was Coordinator of the GeoQuEST Research Center from 2000 to 2005 and Head of the School of Earth and Environmental Sciences from 2007 to 2009.

Professor Head's research – focused on long-term changes in the Australian landscape and the interactions of both prehistoric and contemporary peoples with these environments – has positioned her as an international leader in geographic debates about the relationship between humans and nature. Her work is multidisciplinary and draws on concepts and analytical methods from physical geography, archaeology, and cultural geography. Her Ph.D. and early postdoctoral work focused on terrestrial pollen records to reconstruct Aboriginal landscapes, with significant contributions to archaeological research in southwestern Victoria and Australian prehistory.

Professor Head was the first Australian to be appointed the King Carl Gustaf XVI Visiting Professor of Environmental Science, taken up at Kristianstad University, Sweden, in 2005–2006. The international eminence of her work was also recognized when she was among the first group of Australian Research Council (ARC) and Australian Laureate Fellows announced in 2009.

Major Accomplishments

Central to Head's intellectual contributions is the concept – and challenge – of coming to terms with landscapes that have been peopled for many thousands of years. Although it is now widely understood that human influences pervade all Earth surface processes, ideals of pristine past landscapes without people continue to dominate environmental management. Head's scholarship has focused on articulating, then finding ways to overcome, these contradictions. Her theoretical contributions are grounded in the empirical findings of fieldwork projects across tropical, temperate, arid, and urban Australia. Her early work made significant contributions to knowledge through study of the social and ecological dimensions of Aboriginal fire and implications for vegetation change; prehistoric and contemporary Aboriginal

interactions with East Kimberley landscapes; and the pioneering study of stick-nest rat nests as evidence for vegetation and climate change in arid Australia.

Professor Head's recent work has been mostly in cultural geography, where she has continued her work on nature/culture interactions, and human-plant relations, in more contemporary time frames. Projects have included research on backyard gardens, wheat, and invasive plants. Head is Founding Director of the Australian Center for Cultural Environmental Research (AUSCCER), established in 2009 and funded by her ARC Laureate Fellowship and the University of Wollongong. AUSCCER aims to make significant conceptual, methodological, and practical contributions in conceptualizing the cultural environment and advancing cultural research for environmental sustainability.

Professor Head's professional service includes President of the Australian Quaternary Association (1989–1991); President Australia, NZ, and SW Pacific Subcommission, INQUA Holocene Commission (1995–1999); Chair Australian Academy of Science National Committee for Geography (2006–2008); and President and Vice-President Institute of Australian Geographers (2006–2011). Professor Head is a Fellow of both the Australian Academy of Humanities and the Australian Academy of Social Sciences.

Head-Smashed-In Buffalo Jump

Jack W. Brink[1] and Erna Dominey[2]

[1]Royal Alberta Museum, Edmonton, AB, Canada

[2]Athabasca University, Athabasca, AB, Canada

Introduction

Over four million years of evolution as hunters, nothing in human history compares to the amount of food obtained at one "buffalo jump" on the Great Plains of North America. Elsewhere, animals much larger than the bison have been hunted for food – mammoth, rhinos, giraffes, elephants, and whales – but usually just one at a time. But in the great communal hunts, many groups of Plains hunters would cooperate to bring down as many as a hundred bison. At the conclusion of a typical successful

jump, something in the range of about 60,000 kg of meat, fat, hide, and bone lay at the bottom of a cliff.

Hundreds of mass bison kill sites have been found in the western United States and Canada; some are yet to be discovered, still more have been swept from the land by erosion, cultivation, and settlement. Of all that are known, perhaps the most imposing, perfectly designed, consistently executed, and lethal buffalo jump is Head-Smashed-In. It has been recognized as a Provincial Historical Resource in Alberta, a National Historic Site in Canada, and a UNESCO World Heritage Site as the premier example of a buffalo jump in North America.

Definition

Head-Smashed-In Buffalo Jump is located in southwestern Alberta, Canada, about 160 km south of the city of Calgary and 20 km west of the town of Fort Macleod (Fig. 1). It lies directly east of the Rocky Mountains, at the very southern terminus of a linear set of rolling uplands known as the Porcupine Hills, with the immense edge of the northern Plains to the east. Tracking herds of bison on the open prairie would have been a daunting exercise, but the rolling, broken country surrounding Head-Smashed-In is ideal for rounding up and moving herds of grazing animals. The hills also attract large numbers of herbivores, thanks to the great amount of dependable water, the shelter of valleys and occasional groves of trees, and the rich, nutritious rough fescue and blue grama grasses. The combination of these features leading to sheer sandstone cliffs almost always guaranteed a successful hunt.

The total area of land figuring into the Head-Smashed-In Buffalo Jump complex is vast, covering some 40 km^2. This includes the massive natural basin of the Porcupine Hills that lies to the west side of the jump, dozens of individual lines of small stone cairns (rock piles) that formed the drive lanes along which the bison were herded, the cliff itself, the kill site below the cliff, plus an extensive prairie whereon the spoils were butchered and processed.

Head-Smashed-In Buffalo Jump, Fig. 1 Location of Head-Smashed-In Buffalo Jump in southwestern Alberta, Canada

Key Issues

The Basin

Directly west of the jump extending toward the mountains is a huge collecting basin where the bison were rounded up (Reeves 1978). It is a natural bowl-shaped landform with a number of tributary basins that feed into the main basin, mostly from the north side, adding additional territory from which bison could be harvested to bring to the jump. The complex topography of the basin produced a landscape ideally suited for hunters to use in hiding, running, maneuvering, and orchestrating the events of the kill. A small stream draining the main basin provides water for hunters and bison alike. The almost perfectly formed gathering basin at Head-Smashed-In was the single most important factor in making this site perhaps the most productive of all known buffalo jumps, because it directed herds located in the region to the kill.

The Drive Lanes

Long lines of rock piles used at many bison kills to funnel the animals in the desired direction are called "drive lanes." Although farming has disturbed some of the rock lines at Head-Smashed-In, many remain intact. More than two dozen lanes have been identified and mapped, some extending as much as 8 km from the kill site (Reeves 1978; Rollans 1987). Today the lanes consist of small clusters of rocks that are rarely a foot high. It is unlikely that the rock piles were ever higher; rather, their role in directing herds of bison was derived from the addition of other materials to the rock piles: stacks of buffalo chips (dung), clumps of overturned sod, and especially branches of trees and brush that were likely wedged between the rocks (Brink and Rollans 1990). The purpose of the rock piles may have been twofold: to serve as a permanent marker for the proper direction of the drive to the cliff and as a place to anchor brush and branches that made the structures more imposing, more visible, and perhaps more like human beings.

The Cliff

The cliff that formed the jump-off faces east, as do many other bison kills in the area. Winds prevail from the west, so having the kill located downwind from the direction of the drive helped to hide the scent of hunters waiting at the site. The cliff at Head-Smashed-In is currently about 10 m high (Fig. 2). But windblown soil, bedrock topple, decayed vegetation, and bones of bison have gradually accumulated on the narrow bench below the cliff. The deepest excavations at the kill site recovered artifacts and bison bones nearly 10 m below the current surface (Reeves 1978). Thus, when the site was first used some 5700 years ago,

Head-Smashed-In Buffalo Jump, Fig. 2 The cliff at Head-Smashed-In and the bench below where the killing and initial butchering was conducted. (Courtesy Royal Alberta Museum)

bison were falling a considerably greater distance, so the fall was probably lethal. As debris accumulated at the base of the cliff over millennia, the drop became shorter, meaning that more animals had to be dispatched at the bottom of the cliff.

The Kill Site

Slump and bedrock topple has formed a narrow bench that parallels the north–south trend of the cliff (Fig. 2). This bench was the kill site, where the bison slammed into the hard earth, wounded animals were finished off, and initial butchering of their carcasses took place. An average buffalo jump may have involved some 50–100 animals (Frison 1991). This represented an enormous butchering task. The carcasses would spoil quickly if steps were not taken to process the meat and fat. The mound of carcasses was pulled apart, the thick hides of the bison removed and their stomachs opened to remove the heat-generating gastric fluids. With this accomplished, carcasses would cool down much more quickly. Individual bison were then cut into manageable pieces and loaded on the hides. These carcass portions were then dragged down slope to the prairie for the next step in the rendering procedure.

The Butchering/Processing Site

To the east of the Head-Smashed-In kill site, the ground slopes down sharply for about 100 m, then levels off into a broad prairie. This region served as an immense butchering area (Brink and Dawe 1989). Most likely, the piles of disarticulated pieces of bison carcasses were rendered into a variety of food products here. It was critical to treat the animal remains in ways that ensured long-term preservation, or the great effort of the communal drive would have been in vain. Drying was the most common preservation method. Meat and fat were cut into thin sheets and hung from wooden racks to be dried by the incessant winds of the Plains. Meat was also smoked over damp fires to reduce moisture further and to impart chemicals from smoke that aid preservation. Meat dried thus would last for weeks and months and was also much lighter to carry away from the site.

A great deal of cooking was also conducted at the Head-Smashed-In butchering site. A favorite cooking technique was to dig pits into the prairie soil and line them with a fresh bison hide (fur side out) filled with water. Rocks heated in a nearby fire were placed in the pits to bring the water to a boil. Many types of soups and stews were made in this manner. Roasting was also popular. Deep pits were lined with slabs of rock, meat wrapped in vegetation placed inside, and a fire made on the surface above. Left for many hours, the meat cooked in its own juices and was said to be a rare treat.

Archaeological studies of the butchering area have uncovered countless fireplaces, literally tons of stones used for boiling and dozens of roasting and boiling pits. Thousands more are estimated to remain at the site (Brink and Dawe 1989, 2003).

Future Directions

The future of Head-smashed-In Buffalo Jump lies more with public interpretation than with continuing archaeological research. In 1987 a 10,000 square foot interpretive center opened, funded, and operated by the Alberta government. The Head-smashed-In Buffalo Jump Interpretive Centre (Fig. 3) has since welcomed nearly three million visitors. It is built into the sandstone bedrock cliff and contains five levels of interpretive displays as well as a theater, gift shop, cafeteria, and administration areas. With 90% of the building underground, Head-Smashed-In preserves the vistas and the sense of the jump at the time it was being used.

From its inception, Head-Smashed-In was intended to be inclusive of contemporary Aboriginal people. Members of the local Blackfoot Nation played important roles in the planning and development of the site as well as on the archaeological digs. Blackfoot people continue to advise on the operation of the site and still make up most of the staff (Brink 1992; Slater 2006).

Annual visitation in 2016 was about 60,000 people. However, this number has been declining for more than a decade, so directions for the future

Head-Smashed-In Buffalo Jump, Fig. 3 The seven-story interpretive center built into the cliff at Head-Smashed-In. (Courtesy Head-Smashed-In Buffalo Jump Interpretive Centre)

at the site are aimed at reclaiming visitation. A major renovation to the building is planned, a number of new exhibits are now in place, and a process of renewing and replacing old exhibits continues.

While no archaeological research has been conducted at the site since the mid-1990s, there are continuing discussions with a local university to operate a field school program at the site. If this happens, it will mirror previous digs in that it will intentionally be placed in an area of the site accessible to the public, thus serving as an interpretive display as well as a research project.

Head-Smashed-In celebrates the astonishing skill, ingenuity, knowledge, sophistication, and spiritual power that went into a successful buffalo jump. The interpretive center is open year round. For information visit: http://www.head-smashed-in.com/

Hedges in Historical Archaeology

Tom Williamson
School of History, University of East Anglia, Norwich, UK

Brief Definition of the Topic

Hedges are field boundaries composed of lines of managed shrubs, often growing on a bank and accompanied by a ditch. They are found throughout Britain, and in many parts of lowland Europe including central and western France, the southern Low Countries, and parts of Germany. To serve their primary function, as stock-proof barriers, hedges need to be maintained or else they will develop into a line of disconnected trees and shrubs. In some areas they were, in English parlance, *layed* or *plashed*: the hedge was cut back rigorously but some of the principal stems were allowed to remain, cut roughly three quarters of the way through and bent downward at an angle of 60° or more so that each "pleacher" (as they were usually termed) overlapped its neighbor. In the spring, when growth resumed, a thick, impenetrable wall of vegetation was created. Elsewhere hedges were simply *coppiced*, like the understorey in traditionally managed woods: that is, their constituent shrubs were cut down to a point at or near ground level at intervals of between 10 and 20 years. Some local traditions combined elements of both practices.

In England, where most research has been undertaken, hedges of the eighteenth and nineteenth centuries tend to be composed mainly of hawthorn or blackthorn, while older examples contain a range of shrubs, including ash, maple, hazel, dogwood, holly, oak, elm, and hornbeam, depending on soil and climate. In the 1960s, Max Hooper suggested that the difference reflected the fact that these older hedges had originally been planted with a single species but had gradually been colonized by new ones. He further argued, on the basis of a large amount of field survey and documentary research, that this occurred at a relatively steady rate and that a hedge could therefore be approximately dated by counting the number of species it contained in a standard 30-m length, hedges acquiring, on average, one new species per century. Recent research has suggested that the "Hooper Hypothesis" is unreliable for a number of reasons, and especially because in the period before the eighteenth century hedges were usually *planted* with a range of species, in part because of the difficulty of obtaining hedging thorn but mainly because, as well as serving as boundaries, hedges were also regarded as an important source of fuel and fodder.

During the twentieth century, vast numbers of European hedges were neglected or removed. They were no longer needed as a source of fuel; agricultural mechanization and the development of specialized arable farming rendered them redundant and inconvenient in many areas; while even in livestock districts the development of barbed wire in the mid-nineteenth century provided a less labor-intensive method of constraining livestock. In many areas, hedges are now largely retained because of their importance as wildlife habitats and as elements of cultural landscapes.

Hellenistic and Roman Anatolia, Archaeology of

Mustafa Hamdi Sayar
Department of Ancient History, Faculty for Letters, University of Istanbul, Istanbul, Turkey

Introduction

Anatolia, literally "the land of the sunrise" and constituting the Asiatic part of modern Turkey, is a very important peninsula for the birth and transmission of various cultures and peoples (Fig. 1). During the Hellenistic and Roman periods (roughly 300 BCE to 300 CE for present purposes), many cultures such as the Persians, Macedonians, Greeks, and Romans passed through Anatolia and had constant contact with indigenous peoples like the Lydians, Lycians, Phrygians, Pisidians, Cappadocians, and Paphlagonians. The encounter of the new cultures with indigenous peoples paved the way for new transformations and developments in Anatolia's cultural history, which can be defined as "acculturation." The archaeologists of the Hellenistic and Roman periods of Anatolia have been investigating, in the first 12 years of the twenty-first century, this phenomenon of encounter among different cultures and have been posing new scientific questions.

Definition

In the last 150 years, it seems that Anatolian archaeology has been marked by the study and documentation of ancient Greek and Roman cultures, as Western scholars specializing in natural and physical sciences recognized these as incontinuity with the cultures in Greece and Italy. The material elements of Greek culture arrived in Anatolia in abundance after the conquests of Alexander the Great, which introduced the Hellenistic period (after 330 BCE), and after increased Roman intervention, which began in the late second century BCE. Yet, Anatolian archaeology has reached a new stage due to the decipherment of indigenous Anatolian cultures and their written records through comparative linguistic and philological studies employed since the early twentieth century. Cultures like prehistory, antiquity, and medieval and modern periods that encompass the Seljuqs, Emirates, and Ottomans come under archaeological and scientific study, documentation of Anatolian archaeology seems daily to exceed the chronological limits of antiquity and illuminate a wide time span, as attested by numerous new finds.

Historical Background

Research on the Hellenistic and Roman periods of Anatolian antiquity started with the observations of various travellers such as Ibn Battuta in 1333 and Ciriaco di Pizzicolli, a merchant of Ancona between 1430 and 1452. The monuments in the Anatolian land were discovered by monks and pilgrims on their way to the Holy Land, and in 1555 Ogier Ghiselin de Busbecq, the Austro-Hungarian ambassador to Istanbul, deciphered the bilingual Greek and Latin text of *Monumentum Ancyranum* inscribed on the walls of the temple of Mên (Fig. 2). The text, often known today as the *Res Gestae* of the Roman emperor Augustus, contains the personal account of the deeds and wars of Augustus Octavian through the transition from Republic to Empire. Two noteworthy names in the epigraphic studies

Hellenistic and Roman Anatolia, Archaeology of, Fig. 1 Map of Asia Minor. (Modified from van Kampen 1956)

for ancient Greek and Latin inscriptions are Philippe le Bas and William Henry Waddington.

European and American researchers started to excavate archaeologically promising spots in Turkey in the second half of the nineteenth century; however, it is not possible to claim that all these excavations targeting a variety of purposes were the fruits of an academic spirit. The British Museum was in fierce rivalry with the Louvre for the procurement of antiquities at that time.

This rivalry spread to encompass the museums of Berlin and Vienna.

It was in this context that Troy and Heinrich Schliemann became inextricably linked. Schliemann's admiration of Homer led him to search for Ilium where the events of the *Iliad* putatively took place. It was in 1868 when he first went to Troas (Biga Peninsula) from Greece where he had recently settled. Inspired by a long discussed theory, he began searching for Troy at Hisarlık Höyüğü and carried out his first excavations in 1870–1873 and then in 1879. In the first expedition he uncovered what he called "Priam's Treasure." This has been the most exciting archaeological find in history, together with Tutankhamun's tomb discovered at the Valley of Kings by Howard Carter in 1922. The discussions regarding whether the discovery of Schliemann was the actual Troy of Homer continued after his death. The claim was fiercely refuted at that time and paved the way for various discussions today. The scientific value of excavations carried out by Wilhelm Dörpfeld in 1893–1894 was to be appreciated much later. This excavation constituted the basis of modern archaeology, which is based on stratigraphy and chronology established from pottery studies.

Pergamum's excavations received no less interest than those at Troy. Their undertaking was shaped by diverse factors characteristic of this period, including diplomacy and politics between Berlin and the Ottoman administration, railway and road constructions in Turkey, Wilhelm II's passion for archaeology, the establishment of the German Archaeological Institute, and many other contemporary trends. These started with the railway constructions carried out by German companies and the removal of the reliefs of Pergamum's Altar of Zeus to Berlin. The excitement that this grand monument aroused paved the way for an accelerating interest in Anatolia. Carl Humann (1839–1896), the so-called pasha of Pergamum, is considered one of the pioneers of archaeology.

When the Prussian professor of archaeology Otto Benndorf was appointed in charge of surveys in Lycia by the Austrian Academy of Sciences, the Austro-Hungarian Empire grasped the chance to enrich its museum in Vienna. Felix von Luschan and Count Lanckoroński joined in these surveys and excavations culminated in the shipment to Vienna of reliefs of the monumental tomb/heroon at Trysa, dated to the fourth century BCE. Benndorf also founded the Austrian Institute of Archaeology in order to conduct excavations at Ephesus.

The career of Osman Hamdi Bey, son of the grand vizier Edhem Pasha, reached its zenith when he was appointed the director of the Imperial Museum in 1881. In addition to founding the Istanbul Archaeological Museum in 1891, he initiated the first Turkish excavations at Nemrut Dağı, at the Hecate temple in Lagina, and at Sidon. The royal *necropolis* that he excavated at Sidon contained the renowned "Alexander's Sarcophagus," the Whining Women Sarcophagus, the Satrap Sarcophagus, the Lycian Sarcophagus, and the Sarcophagus of the Phoenician King Tabnit, which were all brought to Istanbul, together with other sarcophagi and stelae.

Following the foundation of the Republic of Turkey after World War I by Mustafa Kemal Atatürk, H. T. Bossert and H. G. Güterbock contributed to the discipline of archaeology and research by establishing themselves in the young state and by training Turkish scholars. Bossert became a professor at Istanbul University in 1934. Together with his German student Franz Xavier and multilingual Turkish students Bahadır Alkım, Selim Dirvana, Halet Çambel, and Muhibbe Darga, he dedicated himself to the Hittite hieroglyphs, and between 1947 and 1957 he excavated Karatepe in Cilicia, which was to call for great attention in the future.

After World War II, scholars leaving Nazi Germany were invited to Turkey by Atatürk. Before the Nazis came to power in Germany, the German Archaeological Institute had opened its Istanbul branch in 1929, whose first director was Martin Schede until 1938, and the Turkish Historical Society (Türk Tarih Kurumu) was founded in Ankara in 1931. Promising youths were sent to Europe for university education at the demand of Atatürk. Among these students were Sedat Alp and Ekrem Akurgal, both of whom went to Leipzig to learn languages at the Schulpforta

Gymnasium, renowned because Friedrich Nietzsche and Ulrich von Wilamowitz-Moellendorff studied there. After language training, they went to Berlin where Alp became the student of Johannes Friedrich and Akurgal of Gerhart Rodenwaldt. They returned to Turkey in 1940 and 1941.

Key Issues/Current Debates

During the twentieth century, Ekrem Akurgal was among the most experienced representatives of modern Turkish archaeology. His second and third generations of students now direct many important excavations. Within his research covering all Anatolia, he particularly concentrated on the Greek culture in western Anatolia. The disputed and unknown location of Dascyleum, the Persian satrapy center as of the sixth century BCE, was clearly identified by him.

Carl Blegen of Cincinnati University directed the excavations at Troy between 1932 and 1938 and brought it back to the focus of international interest. The excavations were halted by World War II and could only be resumed in 1988 by the prehistorian Manfred Korfmann of Tübingen University. The continuous expedition undertaken until his death in 2005 attained an impressive dimension. A chemical engineer and archaeometrist of Vienna, Ernst Pernicka of Tübingen University succeeded him. As of 2013 the excavations will be led by American scholars and will concentrate on the Hellenistic and Roman phases of the city-state of Ilium, a continuation of ancient Troy.

The German tradition at Pergamum continued with the directors of the German Archaeological Institute in Istanbul after World War II. Longitudinal research at Miletus was conducted by Wolfgang Müller-Wiener, an architectural historian and the director of the German Archaeological Institute at Cairo, and Volkmar von Graeve. When the work was resumed, the most unusual temple under Miletus' hegemony, the temple of Apollo at Didyma, which had been excavated by Theodor Wiegand, came under restudy and restoration by archaeologist Klaus Tuchelt. Architectural researcher Lothar Haselberger noticed the payment lists and plans on the inner walls of the adyton, all incised on marble. Similar drawings identified at Sardis and Priene have shown that ancient architects used the walls and floors as sketchbooks. Following a long hiatus, the excavations at Priene were resumed by Wolf Koenigs, an architectural historian of Munich and director of the German Archaeological Institute in Istanbul, and then continued by the archaeologist Wulf Raeck (Frankfurt). The work in this city by the Maeander River has yielded great information, particularly on ancient urban planning and the development of Greek-Roman house architecture. Another important project of the German Archaeological Institute is Aizanoi in Phrygia (Fig. 3). One of the best preserved temples of Zeus in Roman period Anatolia is found there. The archaeologist Ralf von den Hoff of Freiburg University, who took on the direction of the expedition after Rheidt, is particularly interested in the city's development in the Hellenistic period. As of 2011, the excavations were taken over by Elif Özer of Pamukkale University, and the work in 2012 covered the stage building and the *necropolis* behind the theater.

The grandest focus of the twentieth-century archaeology, which concentrated on the architecture of ancient city-state centers, has naturally been Ephesus. The Austrian Institute of Archaeology conducted excavations between 1895 and 1913 as well as 1926 and 1935 under the direction of Otto Benndorf, Rudolf Heberdey, and Joseph Keil. However, during the hiatus created by World War I and the Greek occupation of western Turkey thereafter, Greek scholars carried out some restoration work at St. John's Church and Virgin Mary's House. After World War II, under the direction of Hermann Vetters until 1987, the Roman period architecture of Ephesus was widely uncovered and reconstructed. The best examples are the houses on terraces and the library. The most important data regarding domestic life in Roman Imperial period provinces comes from Ephesus; the only other sites yielding such information are Pompeii and Herculaneum in Italy. On the other hand, the south gate of the commercial agora and the

Hellenistic and Roman Anatolia, Archaeology of, Fig. 3 Maximum price edict of Roman Emperor Diocletian, CE 301 (Aezani, Phrygia). (Photo by author)

library reconstructed by Friedmund Hueber and Volker Michael Strocka in 1978 provide us with striking evidence regarding the grandeur of life in the capital of province of Asia in the Roman Empire. However, there is a cost to the success of the engineers and architects; intervention in the ruins has led to the damage of some structures of late antiquity. As in many other sites, here too the excavation site has been transformed into something of a construction site, and developments in mass tourism have brought both gains and damages. The largest archaeological park of Turkey, Ephesus continues to grow and develop attracting millions of tourists every year.

Apart from Smyrna there are many other ancient city-states along the Aegean littoral. Though smaller in size, they are of great importance: Nysa and Magnesia by the Maeander River, Claros in Ionia, Teos, Clazomenae (Urla), Phocaea (Foça), Erythrai (Ildırı), and Aigai are some examples. Some stone constructions at Aphrodisias and Sardis, which have been excavated by American teams, have been rebuilt in a similar way to those at Ephesus and Pergamum. The sculpture finds at Aphrodisias are so rich that clearly a school of sculpture was active in Aphrodisias in the Roman Imperial period.

Southwest Anatolia extending between the Maeander and Pamphylia houses numerous ancient cities, monuments, and temples. These include Hierapolis in Phrygia; Iasos in Caria; Patara; Tlos in the upper Xanthus valley; Limyra; Cnidus, located at the westernmost tip of Datça Peninsula; Stratonicea and Lagina; the temple of Carian Zeus Lepsynos in Euromos; the temple of Zeus Labrandeus in the mountainous parts of Caria; the Halicarnassian Mausoleum; Caunus; Arycanda; Xanthus, the capital of Lycia; and the nearby sanctuary of Letoon. A trilingual inscription in Lycian, Greek, and Aramaic has been found at Xanthus, the center of a region with a mixture of Lycian and Greek cultures. This philologically invaluable find can only be compared with a bilingual one in Carian and Greek of a later period found in Caunus.

Eastward along the south coast, the number of sizable excavations is more limited to Perge and Side. Numerous works of sculpture from Perge are accompanied by sculpted marble sarcophagi. Other systematic excavations in Cilicia include Anemurium excavated by Elisabeth Alföldi-Rosenbaum and James Russell (from 1960s to 1980s) and Elaiussa Sebaste excavated by Eugenia Equini Schneider of Roma La Sapienza University since 1995.

Northward and northwestward from Pergamum, there are not many current excavations, except for that at Troy. Recent work has focused on the Athena temple at Assos; Alexandria Troas, founded in the Hellenistic period and turned into a

Roman colony; the temple of Apollo Smintheus; a temple of the Roman Imperial period in Cyzicus; the marble quarry at Marmara Island; Dascyleum; the Persian satrapy center; and the Roman theater in Nicaea (İznik).

As Europeans have traditionally focused on ancient Greek culture and its influence on the architecture and art in the Hellenistic and Roman periods, the central parts of Anatolia have been neglected, with the exception of Hattusha, the Hittite capital. National customs have generally led most scholarly attention toward temples, large roofed structures, theaters, baths, and palaces; thus, most budgets were allocated for such excavations. Hence, systematic study of previous cultures in the country was rendered difficult. However, the British Institute of Archaeology at Ankara (BIAA) founded with the encouragement of Seton Lloyd in 1948 has followed a different course. Although the work that occurred between 1971 and 1978 at certain points in Turkey indicates that the archaeological mentality of the nineteenth-century museums still prevailed, Stephen Mitchell and Anthony W. McNicoll proposed the New Archaeology approach of the British in order to challenge such perspectives. The most successful project of this approach is the one at Aşvan Kale on the south bank of Murat River, which was settled from the Bronze Age through the Middle Ages. David French, the director of BIAA, decided to study the *höyük* and the modern village on its foot, and his efforts culminated in a study exploring the relations between humans and their environment from prehistory to the present. In 1970–1973 he employed the most sensitive sieving techniques and obtained paleobotanic data from this settlement, which contained very infrequent architecture and man-made tools. The purpose was to obtain evidence regarding the living conditions of the concerned period through, for instance, the study of animal bones and carbon samples and then to compare this evidence with the modern village life. The interests of many scholars, however, remained restricted only to the pottery, tools, and architecture, and it took about 30 years for many excavations and surveys in Turkey to adopt the teachings of New Archaeology.

Away from the above-mentioned coastal settlements and in the Central Anatolian Plateau, many excavations of medium and large size are worth noting: Sagalassos in Pisidia, Pessinus in Galatia, and Gordion, the capital of the Phrygians. Amorium, an important Byzantine settlement, has been found in the central part of western Turkey. Similar methods are also employed by joint German-American-Turkish research at Eski Kahta and Nemrut Dağı in Commagene. Elmar Schwertheim, Sencer Şahin, and Jörg Wagner, all students of Friedrich Dörner, attempted to find a path to reach the burial chamber of Antiochus I of Commagene at Nemrut Dağı by using geophysical techniques in 1987–1988 but did not succeed. Dörner, who conducted surveys in Bithynia, founded the Asia Minor Research Center at Münster University in 1968. Under Schwertheim, who succeeded Dörner, this center transformed to a Research Center on Anatolia, focusing on Commagene. The temple of Jupiter Dolichenus at Duluk, which had a worldwide importance in the Roman Imperial period, has been under study and excavation by Engelbert Winter since 2001. Some settlements of Commagene have been flooded under dam lakes – Samosata entirely and Zeugma partially. Rescue excavations were conducted before the dams started to collect water. Rescue excavations at Zeugma have been going on since 1996 as a Turkish-Swiss joint project. Excavation and restoration of Roman villas with gorgeous mosaics are being undertaken by Kutalmış Gökay of Ankara University.

The pioneer of historical geographical surveys in Biga Peninsula was John M. Cook. Philologist Joseph Stauber conducted a study concentrating on Homer's topography in the 1990s. Some surveys in Mysia, Aiolis, and Lydia were aimed mainly at epigraphic research. Already in 1890 the Austrian Academy of Sciences had started compiling inscriptions in Anatolia into an inscription corpus project titled *Tituli Asiae Minoris* (*TAM*). The series, foreseen as a continuation of *Inscriptiones Graecae* published in Berlin, started in 1901 and 1920 when Ernst Kalinka compiled Greek and Lycian inscriptions in Lycia. In Mysia, the environs of Pergamum have come under more detailed study recently. Exploration of Polis Elaia,

the main port of Pergamum, by Felix Pirson has already provided important information on Pergamene history and the historical topography of its environs. The historian Walter Voigtländer and the archaeologist Hans Lohmann conducted surveys in the environs of Miletus in the 1980s and 1990s. In addition Lohmann also surveyed Mt. Mycale facing Samos and discovered many new settlements.

Caria gained in popularity for surveys after World War II: Louis Robert was one of the researchers interested in this region. Besides Amyzon and Tabai, Robert explored Milas as well. George E. Bean explored southwest of Anatolia between 1946 and 1952 and published books on philology and guidebooks. Swedish Paavo Roos prepared a fundamental work on the typology of rock tombs in Caria in the 1960s. About the same time Wolfgang Radt, who would later become the director of Pergamene excavations, was exploring remains of Lelegian settlements in the Halicarnassian Peninsula. A Turkish-French team of Pierre Debord (Bordeaux) and Ender Varinlioğlu (Ankara) as well as Wolfgang Blümel of Köln University collected much data regarding the written works and historical topography of west and south Caria. The Heraclea region in Beşparmak (ancient Latmos) Mountains has been surveyed by Anneliese Peschlow-Bindokat for many years as part of a multidisciplinary project. The Carian-Lycian border region in the Gulf of Fethiye is now under investigation by Hans Lohmann and Werner Tietz, who are conducting new research on the topography and archaeological finds.

In recent years Lycia has been more extensively studied by international research projects. Research work on Byzantine Lycia and Pamphylia by Hansgerd Hellenkemper and Friedrich Hill was published as the eighth volume of *Tabula Imperii Byzantini* (*TIB*). The region was formerly surveyed by Martin Harrison and George Bean as well. Oinoanda, a small city in north Lycia, has a sizable reputation in academia thanks to a long inscription of importance in the history of philosophy. Discovered in the late nineteenth century, the text narrates the teachings of a local Epicurean from the Roman Imperial period about what he had learned from his teacher. Thomas Corsten of Vienna University currently conducts surveys in Cibyratis, another northern neighbor. Bülent İplikçioğlu conducted epigraphical surveys over the last twenty years in some parts of Lycia.

Surveys in south Lycia by the architectural historian Wolfgang Wurster and epigrapher Michael Wörrle are a pioneer of their kind. Wurster studied and compared a series of cities of various sizes, while Wörrle studied and published the incredibly rich epigraphic materials found shedding light onto the history and geography of entire Lycia. The Kyaneai project conducted by Frank Kolb of Tübingen in the 1990s has cast much light onto the quantitatively and qualitatively important finds of this city in central Lycia. The project compiled data for relations between the mother city and its agricultural settlements. Kolb's students have initiated lesser projects of the same framework. These are, for instance, Andreas Thomsen's architectural studies at Avşar Tepesi, Christina Kokkinia's re-transliteration of the Opramoas inscription in Rhodiapolis, and Martin Zimmermann's and Christoph Schuler's research at Teimiussa, Phellos, and Tyberissos. Thomas Marksteiner of Austria has conducted surveys in the area facing Limyra where he had conducted excavations. Sencer Şahin and Mustafa Adak currently survey the border region between east Lycia and Pamphylia while studying the topography and epigraphic evidence through the place names in the *Stadiasmus Patarensis* inscription.

British researchers have been heavily engaged in the region extending from north of Lycia into central Anatolia. The then newly founded American Society for Archaeological Research in Asia Minor encouraged research trips and surveys in the area extending from Rough Cilician coasts to Phrygia and environs in the latter half of the 1920s and 1930s. As per its newly introduced research method, each surface find was photographed and descriptions written, which were published in *Monumenta Asiae Minoris Antiqua* (*MAMA*). More than 1,200 texts copied were finally published in MAMA IX and X by Barbara Levick, Stephen Mitchell, et al. The *Classical Atlas of Asia Minor* published by Bean and Calder

Hellenistic and Roman Anatolia, Archaeology of, Fig. 4 Temple of Zeus Olbios in Diocaesarea in Cilicia Trachea (3rd c. BCE). (Photo by author)

via BIAA is the product of these surveys as well. BIAA supported field research has covered the cities of Antioch in Pisidia, Cremna, Sagalassos, and Ariassos and some agricultural settlements under the direction of Stephen Mitchell between 1982 and 1996. Taking into consideration the research carried out by Bean, Hall, Balance, Mitford, and French, it can be said that Pisidia is a "BIAA region."

Emilie Haspels, continuing in the footsteps of Ramsay, published the first comprehensive study on the rock monuments in Midas City, *The Highlands of Phrygia: Sites and Monuments* in 1971. Louis Robert and Georges Radet are among epigraphers who concentrated on this extensive region. Marc Waelkens has studied in detail the grave stelae called "door-stones," particularly those from Phrygia. Results of epigraphic studies on Dorylaeum (modern Eskişehir) by Peter Frei during the 1980s and 1990s will be published as a volume of *Tituli Asiae Minoris*.

Michael Gough followed W. M. Ramsay and H. Swoboda, who did research in Lycaonia, and studied the Alahan Monastery and the churches in Rough Cilicia between 1952 and 1972. In addition Gough undertook the surveys in Anazarbos (Anavarza). Serra Durugönül, who founded the Research Center for Cilician Archaeology at Mersin University, explored the towers and settlements. In Rough Cilicia Levent Zoroğlu from the University of Konya carried out the excavations in Kelenderis over thirty years. Yusuf Boysal from the University of Ankara/Konya began in the middle of the twentieth century with research into the Zeus Olbios temple in Uzuncaburç (Fig. 4). Detlev Wannagat from the University Rostock continued this research until 2006 (Fig. 5). Recently Emel Erten from Gazi University conducted an archaeological survey and newly carried out new excavations in the ancient city of Olba concerning the Hellenistic architecture. In Rough Cilicia Ümit Aydınoğlu from the University Mersin conducted surveys in Kanytellis (=Kanlıdivane) on the *necropolis*. The first city of Cilicia Plain on the west is Soloi/Pompeiopolis, which has been excavated by Remzi Yağcı over the past 15 years. The results on the columned street from the Roman Imperial time are remarkable. Finally, Friedrich Hild and Hansgerd Hellenkemper conducted a longitudinal survey covering the entire region which was rich in the Late Antique and Early Byzantine remains and published their finds in the fifth volume of *TIB* (1990). All the epigraphic work from the 1930s to 1980s was compiled in two volumes of *MAMA*, several reports, and a monograph. New surveys by historian Mustafa Hamdi Sayar of Istanbul University have found numerous inscriptions. Sayar has also identified the Karasis Fortress which was unknown until recently (Fig. 6). Built

in the Seleucid period, the fortress has been studied by an interdisciplinary team under the direction of Sayar and Adolf Hoffman from the German Archaeological Institute, the Department of Istanbul and prepared for publication. Since 1990, Sayar has also documented monuments of the Roman Imperial period and Late Antiquity in Anazarbos (Fig. 7), the largest city in the Cilician Plains, with an interdisciplinary team under Richard Posamentir from the German Archaeological Institute. The first volume on the ancient inscriptions from this city has been published, and the second volume is under preparation. In addition, Sayar studied and published on the sites of Hierapolis-Castabala and Uzunoğlan Tepesi with Ralph Christian Rosenbauer while he was researching the area of hegemony of the former pirate Tarcondimotus who was active in the late Hellenistic period (Fig. 8). He also investigated the cities of Mallus and Magarsus in the Karataş region with Ralph Christian Rosenbauer from the University of Bern. Mopsuhestia on the Ceyhan River, which was known as Epiphania and located to the north of the Gulf of İskenderun, was among the Hellenistic and Roman cities of Cilicia explored by Sayar. The Cilician capital Tarsus (Fig. 9) and settlements in its environs constitute an important part of Sayar's surveys. The road network concerning these cities and milestones on them have also been explored (Fig. 10).

Hellenistic and Roman Anatolia, Archaeology of, Fig. 5 The monumental tomb in the south of Olba in Cilicia Trachea, probably the monumental tomb of the last Seleucid King (1st c. BCE). (Photo by author)

Cappadocia seems to be poorer in finds. The border region between the Black Sea and Cappadocia, literally between Trabzon and Commagene, as separated by the Euphrates, has

been under the monopoly of British scholars since Biliotti (1874) and Hogarth (1894). David French, a prehistorian from the family and long-time director of BIAA, studied the Roman road network and milestones in entire Anatolia while publishing numerous inscriptions. His last publication was a compilation of inscriptions from Sinope. The most important surveys in the interior of north Anatolia were carried out at Sebastopolis and the Central Black Sea region. Sebastopolis was studied by Bernard Rémy, director of École française d'Istanbul, while the historian Eckart Olshausen of Stuttgart surveyed the Central Black Sea region. The most noteworthy finds in this area and neighboring Paphlagonia are the rock tombs, which the archaeologist Robert Fleischer has recently studied. Work by Hubertus von Gall has been insufficient to document uncountable monuments in Paphlagonia, and the gap in this area has been filled by the doctoral dissertation in Turkish of F. Eray Dökü, which lists all the rock monuments of Paphlagonia. Christian Marek conducted 19 epigraphic surveys in north Anatolia from 1983 to 2009. He has been studying the epigraphy of Pompeiopolis together with his team as of 2006.

Hellenistic and Roman Anatolia, Archaeology of, Fig. 10 Roman road between Tarsus, metropolis of Cilicia, and Pylai Kilikiai near Sağlıklı. (3rd–4th c. CE)

Bithynia on the western tip of north Anatolia is quite behind the Aegean and Mediterranean regions with respect to surveys and finds. There are several local projects on the topography and epigraphy of the region, but the most comprehensive one is that by Karl Dörner and Sencer Şahin. Dörner compiled and studied all the epigraphic material of Bithynia except for Chalcedon (Kadıköy) and published it in the fourth volume of *TAM* (1978). Şahin's surveys cover Nicaea, the largest city of the region. In addition to compiling the texts from this city, he has also encouraged and supported the work on Prusias ad Hypium, Cius, Apamea, and Bithynion/Claudiopolis.

International Perspectives

Recently a new phase in Anatolian archaeology has been marked by the increasing numbers of excavations at ancient Greek and Roman sites as well as settlements and fortifications of the Middle Ages in addition to the East Roman (otherwise known as Byzantine) sites. Not only the indigenous Anatolian cultures, which include the Hittites, Urartians, Phrygians, Lydians, Lycians, and

Galatians, but also incoming cultures that settled in Anatolia, such as Assyrians, Persians, and Sassanids, have been studied in detail in recent years.

Future Directions

Following World War II, fieldwork other than excavations underwent transformation. There were no more travellers riding on horseback. Now suitable motor vehicles are used, thus covering larger areas. "Voyage" is replaced by "survey." This new term is used in the sense of studying large areas focusing on certain material groups. In time new and complex methods have been developed. In comprehensive surveys a single researcher may examine intensively a small area, or a group of researchers may share the site according to a plan and thus cover wider areas. Thus, it becomes easier to study larger areas and to reach architectural remains and all types of scattered surface finds.

Regarding the Greek-Roman civilization on the southern shores of the Black Sea, it is striking that the region has been greatly neglected in terms of academic studies. After the excavations at Sinope by Akurgal and Budde, the first projects worth noting are those at Pompeiopolis by Latife Summerer of Kastamonu University and at Hadrianopolis in Eskipazar by Vedat Keleş of Atatürk University in Erzurum.

Developments attained in Anatolian archaeology with the participation of scholars from a number of countries in the last 100 years have made this peninsula of utmost importance for the study of humankind's history. In the twenty-first century, new ways to examine, document, interpret, and share new finds with wider society and academics will surely emerge.

H

Hellenistic and Roman Egypt, Archaeology of

Paola Davoli
Dipartimento di Studi Umanistici, Università del Salento, Piazza Tancredi, Lecce, Italy

Introduction

Until recently, the archaeology of Hellenistic and Roman Egypt has received little attention from scholars. The reasons for this scarce interest are various and mainly due to the fact that the scholars who are greatly involved in archaeological study and research in Egypt mostly focus on the millenary dynastic or Pharaonic period. Moreover, the best-preserved areas and monuments in the country belong to the periods prior to Macedonian domination. On the other hand, Egypt is the region that has the greatest amount of written

evidence for the Hellenistic and Roman periods, documentary and literary papyrus in particular. These documents have amply contributed to scholarly knowledge of Egypt's economy and culture in the period between Alexander the Great's conquest (332 BCE) and the Arab conquest (639 CE).

For a long time classicists and papyrologists have been the only scholars to work on Hellenistic and Roman Egypt. Only scarce attention has been dedicated to aspects related to material culture and to archaeology, which has often been merely considered a means to acquire new texts. Besides, the poor state and scarce conservation of monuments of this period have apparently encouraged classical archaeologists to shift their interests toward other provinces, and Egypt has often been considered a unique case for the survival of ancient Egyptian language and culture until the late Roman period.

A favorable concomitance of historical, climatic, and geographic conditions contributed to the good conservation of Egyptian cultural heritage at least until the end of the eighteenth century. The modernization of the region and its demographic growth, which started at the beginning of the nineteenth century and are still in progress, have contributed to the loss of several archaeological areas and monuments, sacrificed in the name of progress and economic development (Davoli 2008). Many ancient settlements have been destroyed to extract natural fertilizer (*sebbakh*) and to obtain building materials to be reused. Most of the more recent archaeological strata, namely, from the Byzantine, Roman, and Hellenistic periods, were the first to be dismantled. Another cause of demolition of later inhabited levels can be found in the prevailing interests of the first archaeological excavations, mainly focused on the Pharaonic levels. Much archaeological, urban, and architectural information was lost during the hurried excavations, as is evident, for example, in the great temples and *necropoleis* in the area of Thebes (Luxor).

It is certain that the substantial lack of classical monumental architecture in Egyptian territory is not due to its absence but to a systematic reutilization of stone materials that began in Late Antiquity and to a widespread use of mud brick, which is far less durable than the stone. In recent years an increasing number of scholars and archaeologists have conducted excavations and studies on Greco-Roman and Byzantine Egypt (Bagnall and Davoli 2011). Archaeological excavations and surveys all over the country have demonstrated the widespread presence of classical architectural elements and buildings that do not belong to local traditions, such as public baths (Boussac et al. 2009), theaters, and hippodromes. Urban studies, settlement excavations, investigations of quarries, and caravan trails, not to mention the difficult recovery of Alexandria and its harbors, are filling a gap in our knowledge of the territory and of its exploitation in the post-Pharaonic and pre-Islamic periods (Bagnall and Rathbone 2004).

Definition

Material culture, architecture, and city planning from Alexander the Great's conquest in 332 BCE to the beginning of the reign of Constantine I as the sole emperor in 324 CE constitute the core of the study of the archaeology of Hellenistic and Roman Egypt. There is, however, a cultural continuity between the late Roman and the Byzantine periods, and it is consequently difficult to determine precisely the chronological limits of a discipline.

The field of investigation for the archaeology of Hellenistic and Roman Egypt covers all Egyptian territory, including the Delta, the Nile Valley, and the eastern and western deserts, together with the Red Sea and Mediterranean coasts. In this period a homogeneous culture in fact existed throughout this vast territory, which was controlled and administered by a central authority based in Alexandria. Nevertheless, regional traditions persisted and are evident in the production of ceramic pottery, architecture, and town planning.

Key Issues

Alexandria assumed the role of capital of the country as early as 320 BCE and brought about a loss of importance for Memphis, the previous

historical capital and administrative center. The location of the new capital on the Mediterranean coast shifted the central administration's center of gravity to the sea and even beyond Egypt itself. This position certainly suited better the new political and commercial situation of the period and opened Egypt to the Mediterranean world. The Ptolemaic kingdom extended its boundaries outside Egypt, and its Greek maritime fleet enormously improved trade and movement in the Mediterranean, in which the Egyptians of the Pharaonic period did not excel.

Alexandria was built according to classical schemes and styles, following the prompting of Alexander himself, but in the meantime using stone monuments from previous periods located in the cities of the Delta. The city is today lost; part of it is buried by the new Alexandria and part of it has been demolished to recycle building materials (McKenzie 2007: 8–18). Recent archaeological investigations at Kom el-Dikka, in various places in the city center, and at the harbor are considerably improving the knowledge of its urban layout and stratigraphy. The use of water in the city and as a means of communication and trade has been the recent object of important archaeological, geographical, and historical investigations that have extended also due to Alexandria's surroundings. Water continued to have a central function in post-Pharaonic Egyptian religion and politics. Numerous local and regional hydrological projects were implemented in the Hellenistic and Roman periods, including the reclamation of large territories for irrigation. The best-known example of this is in the Fayyum, thanks to the conservation of a series of settlements and documents written on papyrus (Davoli 1998).

The Nile Delta, which was less investigated until the last few decades, is now the focus of surveys, archaeological excavations, and hydrographic studies that have finally filled a noteworthy gap in our historical knowledge of Egypt. 700 sites have become recent objects of investigation (Bagnall and Davoli 2011: 108–14), but much needs to be done to reach a detailed picture of the settlements from the Greco-Roman period. These seem to be characterized by the lack of perimeter walls and by the presence of a large main temple surrounded by high walls and situated in a prominent position, often with a *dromos*, or a processional way, that constituted one of the road axes (Leclère 2008). In the *metropoleis* (main cities) of the *nomoi* (administrative regions), there could be more than one temple with a *dromos*, as in the case of Tanis. The history of the landscape, including changes in the course of the Nile's branches in particular, is providing new elements for the evaluation and comprehension of the local dynamics of human habitation. The development and decline of settlements depended on their relatively strategic locations close to waterways. Furthermore, subsidence has caused the sinking of settlements such as Herakleion/Thonis, recently discovered through underwater explorations. Herakleion/Thonis and Canopus were two of the most important harbors on the Mediterranean Sea, as they were strategically located on the Canopic branch and consequently directly linked to the Nile, which was an artery that helped connect the Mediterranean Sea, Africa, and Indian Ocean at the time.

Other important commercial settlements were founded on the coast west of Alexandria (Davoli 2010: 351–2), in a zone no longer within Egypt's boundaries but connected with it. The westernmost of these was Paraetonium (Mersa Matruh). Among them was Plinthine, well known for its *necropolis* that counts about a hundred Hellenistic well-preserved hypogea (second century BCE). The town seems to have had a role in commercial traffic on Lake Mareotis, as did Taposiris Magna (Abusir), one of the places associated with the cult of Osiris and the location of an imposing temple dedicated to the god. Its *temenos*, built of limestone blocks, is preserved. Taposiris Magna probably had the role of a customs station. Additionally, Marina el-Alamein (Leukaspis or Antiphrae) was involved in trade as well as the agricultural exploitation of the area since it was located on the terrestrial and maritime communication routes between Alexandria and Cyrenaica. The *necropolis* has been restored: there were different types of tombs, built with local stone, that were sometimes adorned by monumental structures in the form of pyramids, sarcophagi, pillars, or columns.

The area of Lake Mareotis was important for both commercial and agricultural reasons. Many installations for wine production attached to rural villas with vineyards have been identified: they started to develop during the Hellenistic period and expanded considerably in the Roman period. About 30 workshops for the production of amphorae for transport, used for the trade of locally produced wine, have been recently discovered.

The western and eastern deserts have also attracted renewed attention for the Hellenistic and Roman periods in regard to agricultural exploitation in the oases and in regard to the opening of new communication routes to the Red Sea and its ports. These ports, which were oriented toward eastern trade, include Myos Hormos, and Nechesia (Marsa Nakari) (Sidebotham et al. 2008; Bagnall and Davoli 2011: 134–7). The eastern desert was also exploited for the extraction of precious stones, such as black granite (Mons Claudianus), porphyry (Mons Porphyrites), and emeralds (Mons Smaragdus), mainly in the Roman period.

Edfu and Koptos, in the Hellenistic and Roman periods, respectively, became key cities for trade because of their location on the Nile and at the confluence of caravan trails leading toward the Red Sea's ports (Davoli 2010: 256). Koptos in particular was an important emporium through which passed the goods imported from Arabia and India and then shipped toward the Mediterranean Sea along the Nile. The caravan routes of the eastern desert were equipped with rest areas constituted by small forts (*praesidia*) at whose center was a well for water (Cuvigny 2003). The excavations conducted at Berenike, on the Egyptian coast of the Red Sea, have revealed the importance assumed by this port in trade between the Hellenistic world, and then the Roman Empire, and India. The materials found there also indicate the existence of commercial routes from and to Arabia and the east African coast, from which elephants and ivory were imported. The port and the city reached their maximum expansion during the first three centuries of the imperial Roman period; they were inhabited by soldiers and by a multiethnic population of traders (Sidebotham 2011).

In the oases of the western desert, which were already very active during the Third Intermediate and the Late Periods, a demographic expansion and consequently an increased number of settlements occurred during the Roman period. Recent excavations at the various sites of Bahriya, Dakhla, and Kharga oases attest to the presence of intense agricultural activity and commerce from and to the Nile Valley, and even Africa and the Mediterranean, and a noteworthy prosperity exhibited by large richly decorated houses, stone temples, monumental tombs, and thermal structures (Bagnall and Davoli 2011: 138–41). At Kellis (Ismant el-Kharab) and Trimithis, both located in Dakhla Oasis, the practice of decorating houses, temples, churches, and tombs with wall paintings on plaster in classical and Egyptian styles and with plastic refinements molded from stucco plaster, such as capitals and cornices, was particularly widespread in the Roman and Late Roman periods (Bagnall and Davoli 2011: 140–1). The discovery of stone temples decorated in high relief (first and second centuries CE) shows the interest of Roman emperors for this marginal area of the Empire, which received particular attention also during the tetrarchy, when a series of small forts were erected probably for the defense of the caravan routes. The desert, its arid climate, and its remoteness from large populated areas have favored an optimal conservation of many archaeological areas and buildings built mainly of mud brick. For some of these sites, continuous habitation is attested from the Old Kingdom to the Mamluk period, as in the case of Mut el-Kharab, the main city in the oasis of Dakhla, for example (Hope et al. 2009).

The Fayyum is a region of the western desert not classifiable as an oasis, but better as a pseudo-oasis. It is a natural depression located approximately 100 km southwest of Cairo and supplies by water from the Nile through the Bahr Yussuf, a branch of the Nile. A very fertile area, it became a widely exploited agricultural region when Ptolemy II completed a land reclamation project that consisted of the digging of numerous artificial channels and the building of dams and sluices that facilitated the optimal usage of water for agriculture. Various new settlements of colonists

were founded and expanded, with assignments of land to "Greek" immigrants. Only a small part of those settlements (Davoli 1998), for which the regional capital was Crocodilopolis (Medinet el-Fayyum), has been preserved because of their location along the perimeter of the region, at the edges of the desert. The sand has preserved not only houses of mud brick but also temples and abandoned furnishings, among which there was a large amount of papyri. Some of these sites have been preserved until today and are still under excavation and survey, such as Soknopaiou Nesos (Dime), Karanis (Kom Aushim), Bakchias (Kom el-Atl), Tebtynis (Kom Umm el-Boreigat), Narmouthis (Medinet Madi), and Dionysias (Qasr Qarun). By contrast, other sites were excavated from the end of the nineteenth century to the first 30 years of the twentieth century only to disappear subsequently because of the activity connected to modern land reclamation projects. Among these are Philadelphia (Kom el-Kharaba el-Kebir) and Theadelphia (Bathn Ihrit), where, besides a great number of papyri, Roman funerary portraits (the so-called portraits of the Fayyum) and an intact temple dedicated to the crocodile god Pnepheros (partly preserved today at the Greco-Roman Museum of Alexandria) were found.

Karanis is so far the most investigated and best-known site, thanks to the excavations conducted by the University of Michigan from 1924 to 1935 (Davoli 1998: 73–116). Beyond the evolution of the site, whose five inhabited levels have been explored, and its urban layout and architecture, studies of categories of materials, such as ceramics, lamps, coins, and statuary, have become possible. Such cataloguing has constituted a useful starting point for comparing categories of objects, whose typological evolution, production, and circulation are now better known, and for the publication of recent works on them.

The Greco-Roman settlements in the Fayyum are often multi-stratified because of the accumulation of sand and phases of abandonment that alternated with phases of reoccupation and expansion. Some of those settlements can be defined as small urban units (towns) in terms of social complexity, population density, and urban structure. They reached maximum extension and flourished during the first centuries of the Empire, and, like the sites in the Delta, they are characterized by the lack of perimeter walls and the presence of at least a main temple surrounded by a *temenos*. The *dromos*, provided with one or two kiosks, constitutes the continuation of the temple into the settlement, and on it processions, or religious celebrations that involved the inhabitants many times a year, took place. The papyrus documentation and the monuments found along these processional areas permit a dating of the foundation of temples and their *dromos* to the Hellenistic period, with expansion and rebuilding during the Roman period. The *dromos* was considered the main public area in these settlements, in which no *agora* was generally present (Davoli 2011: 80–81). The most exceptional *dromos* in terms of its monumental features is that of Soknopaiou Nesos, originally 400 m in length and built so that it was elevated 3 m higher than the roads parallel to it. In such a way it constituted a barrier that divided the settlement into two parts, and it was also a scenographic footbridge for processions. Two tunnels built within the road's foundations and various lateral stairs allowed people to go from one quarter to the other and to go over the *dromos* (Minaya 2012).

The Hellenistic and Roman settlements in Egypt seldom imitate the capital Alexandria in their urban organization. The solutions adopted in small provincial towns are not standardized and often reflect regional particularity. By contrast, the *metropoleis* of the *nomoi*, insofar as they are poorly and little preserved, exhibit more monumentality only in part inherited from pre-Hellenistic periods. New types of buildings, whose existence is known above all through written sources and a few architectonical remains, were built by the local elite according to Classical style or Alexandrian style. In particular, an intense monumental building phase is documented by papyri from the second to the fourth century CE (Davoli 2011: 70).

The study of stone architectural material from Alexandria and other places in Egypt (Pensabene 1993; McKenzie 2007), together with the study of archaeological remains scattered throughout the region, reveals a certain diffusion of monumental

buildings in Classical style beyond what has been expected, at least in the main cities. It is accordingly thought that the urban landscape was not very different from that of other provinces of the Empire (Bailey 1990). Nevertheless, a strong local influence endured in urban life in this period due to traditions of building with regional peculiarity for thousands of years and to the presence of cultic buildings and structures in Egyptian style. The style in which certain buildings were built was often a new architectonical style, called Greco-Alexandrian. It was created in Alexandria and was circulating as early as the second century BCE. In this style some elements of Egyptian tradition are found along with Classical ones, which in their turn were employed according to new schemes and combinations. The Classical and Alexandrian styles were mainly used in buildings that did not exist in the dynastic period in Egypt, such as public squares, streets with colonnaded porticoes, public baths, fountains, theaters, hippodromes, perhaps gymnasia, and temples dedicated to divinities not Egyptian and to the imperial cult. The temples dedicated to Egyptian gods continued to be constructed in Egyptian style, but with various innovations (Arnold 1999).

Among the settlements founded in the Roman period, one was willed by the Emperor himself during a visit to Egypt in 130 CE: Antinoopolis, today Sheikh Ibada. The emperor Hadrian founded this city (*polis*) in the place where the Via Adriana started toward the Red Sea. The new city was mainly inhabited by "Greeks" coming from other areas of Egypt, and in particular from the Fayyum, to whom particular privileges were granted. The urban organization follows classical architectural schemes and models, with a perimeter wall on three sides, a *cardo*, and a *decumanus* whose length was adorned with statues and Doric columns. The city plan (Pensabene 1993: 274, Fig. 178) seems to follow a grid plan with two main street intersections on which were four, granite, monumental columns (*tetrastylon*), in Corinthian style, and surmounted by statues. There were also a triumphal arch with three fornices, a theater, a large public bath, and a hippodrome outside the city. It was probably after the foundation of Antinoopolis that other cities adopted monumental architecture of a Classical style, such as Hermopolis Magna (Bailey 1991), located nearby. Also this city adopted a *tetrastylon* and public buildings in Classical style situated along the main roads. The preexisting temples dedicated to the Egyptian divinities Amon and Thoth were integrated in the new city plan, in which various cults and styles coexisted.

During the tetrarchy, military forts were built in Egypt to host regional garrisons, just as in other provinces. Besides the well-known fort built by Diocletian around Luxor's temple, the fortresses of Dionysias and Narmouthis in the Fayyum, those of Trimithis and el-Deir, respectively, in the oases of Dakhla and Kharga, and those situated along the Nile Valley (at Atripe in Sohag, at Wadi Kubbaniya, and at Nag el-Hagar to the north of Aswan) are to be mentioned (Bagnall and Davoli 2011: 121, 131, 141). Other fortresses were built on the borders, like Tell el-Herr, to the south of Pelusium, which has seen continuous use from the fifth century BCE to Late Antiquity (Bagnall and Davoli 2011: 113). This fortress, together with those at Sile and Pelusium, constituted part of a chain of forts located along the eastern border and mainly possessing the duty of regulating trade. Also the fortress of Babylon (Old Cairo) has recently become the object of excavation and restoration. It is now certain that it was located on Trajan's canal, that it silted up at the beginning of the Islamic period, and that various harbor installations were located nearby (Shehan 2010).

The multiethnic culture of Egypt during the Greco-Roman period is also expressed in funerary beliefs. Next to the purely Egyptian *necropoleis*, in which the tradition of mummification persisted, there were *necropoleis* for incineration and inhumation, the last being especially widespread in Alexandria, in which large underground complexes with multiple tombs and various *loculi* are present. Alexandria's *necropoleis* certainly constitute the best preserved part of the ancient capital and testify to the presence of various cults and social groups, Christians and Jews included. The more monumental *necropoleis* are those of Kom el-Shuqafa, which developed on three storeys and were decorated with bas-reliefs in the

Egyptian style of the Roman period (first and second centuries CE). But no less important for the history of the city are the Gabbari's collective *hypogea*, dated to the beginning of the third century BCE.

Mummification continued to be practiced until Late Antiquity according to techniques that gradually became more imprecise and hasty. Since the end of the nineteenth century, great interest has been revived in the so-called portraits of the Fayyum, which were painted on wooden tables or on textile during the Roman period, and set in the bandages of mummies, and have been found in great number in the Fayyum as well as in other places in the Nile Valley. These portraits follow in function the tradition of the funerary masks of the Pharaonic and Hellenistic periods, as is also the case with painted shrouds and sarcophagi (Riggs 2005). The funerary documentation that has been preserved, as well as the varied testimony for regional traditions, is very rich. Monumental tombs of the Roman period have been found in the oasis of Dakhla; they were made out of mud brick and decorated with stuccos and wall paintings. Among the more singular monuments are a number of "pyramids," which are often only partially preserved, truncated at the top, and with plinth bases in which sometimes funeral rooms painted with traditional Egyptian motifs were built. On the contrary, the decoration is in Classical style on the outside, like on the tombs at Bir el-Shagala, Dakhla. Of noteworthy monumentality is also Tuna el-Gebel, the *necropolis* of Hermopolis Magna (El-Ashmunein), in which are stone temple tombs from the Hellenistic period. That of Petosiris is a sort of prototype. The so-called house tombs of the Roman or Late Roman periods are sometimes built with mud brick; they often are articulated into several floors and are richly decorated with stuccos and paintings (Lembke 2010: 234–40). Small pyramids are also present there.

Workshops for the production of ceramic pottery have been found in several sites and testify to the introduction of new cooking techniques for the production of copies, such as in the case of kilns of the first century CE at Buto in the Delta (Ballet 2007). The careful study of ceramic vessels is now widespread in archaeological excavations in Egypt, but with a great delay compared to other countries, with the consequence that complete repertoires for the Hellenistic and Roman periods are still lacking. The general picture that emerges is that of a local Hellenistic and then Roman production that imitates the shapes widespread in the Mediterranean, but with different clays and fabrics, and peculiar morphologies according to the region. This enables the identification of the inland commerce both of vessels and of products contained in amphorae and jars. The fabrics used are made from Nilotic silt, marl clays, and kaolinitic clay from Aswan (since the end of the Hellenistic period) and the so-called iron-rich clay of the oases. The compositions and the techniques of manufacture and baking became increasingly refined due to the influence of the so-called "sigillata" vessels imported from Italy and from the Eastern Mediterranean and of African "sigillata" imported during the later Empire. There is no discontinuity in production from the end of the Hellenistic period to the beginning of the Roman period. The study of amphorae has led to the identification of vast areas of production, if not individual workshops, associated with the production of wine, such as in the area of Maryut Lake (typologies AE 3 and 4) and the Fayyum in the Roman period (Marchand and Marangou 2007).

Besides the production of earthenware pottery, that of molded statuettes (*coroplastica*) was widespread in Egypt during the Hellenistic and Roman periods; these represent divinities, men and women, and animals too. The usage of such figurines ranges from temple precincts, probably as ex-voto offerings, to domestic and funerary contexts. It appears that such usage had been introduced to Egypt by Macedonian soldiers at the moment of the conquest of Alexander the Great; the iconography and the subjects, initially inspired by Greek culture, became increasingly derived from local Egyptian culture in later times. A workshop dated at the beginning of the Hellenistic period has been identified at Athribis in the Delta (Szymańska 2005).

Faïence and glass are two kinds of materials widely used for the production of vessels, small

statues, and decorative elements. Already in use in the pre-Hellenistic period for the production of similar manufactured items, the techniques and shapes used during the Greco-Roman period transformed and were enriched (Nenna and Seif el-Din 2000). During the Roman period particularly the techniques for the production of blown glass vessels, which reproduced forms common to the Empire, were imported. The glass raw material was produced in Egypt in workshops of the "primary" type, thanks to the presence of natron in natural deposits situated in the western desert to the south of Alexandria. Workshops of this type have been found at Beni Salama, in Wadi Natrun.

International Perspectives

In recent years research in the region has highlighted the strategic importance of Egypt, which can be understood as a commercial crossroads during the Hellenistic and Roman imperial periods. Water ways and caravan trails in the desert are quite well known, but much remains to be done to enable full understanding of the importance and modalities of international trade. Poorly known is the dispersion of ceramic vessels and other objects of Egyptian production in the countries linked to this trade, in the Arabian peninsula and India in particular. The systematic study of Egyptian ceramic is very recent if compared to the study of ceramics of other ancient civilizations. This is the main reason for the misidentification and thus of lack of data concerning the types and quantities of Egyptian pottery vessels found in other countries.

Future Directions

There is no doubt that the archaeology of the Greco-Roman Egypt is at its beginning. Many settlements and *necropoleis* still need to be excavated with rigorous scientific methods, and materials from previous excavations and stored in museums need to be studied and published. The archaeological methods applied in Egypt are still often obsolete and inadequate to answer the questions of a scientific world by now accustomed to studying ancient civilizations with multidisciplinary approaches. The so-called "archeometric" analyses and landscape archaeology are still not very common, even if in part because of the heavy restrictions imposed by Egyptian law.

Numerous artifacts and documents housed in collections and museums all over the world are completely out of their archaeological context because of the conditions of their discovery and their dispersal through the antiquities market. The study and virtual relocation of these artifacts within geographical and cultural contexts would enable their better evaluation and comprehension, not just in regard to their specific characteristics but also in terms of their material functions in the daily and religious life of the population.

The archaeological research conducted in the last 10 years has substantially contributed to a better understanding of the multicultural society of Egypt during the Hellenistic and Roman periods, which until now has been mainly studied through the rich textual documentation available in Greek, Latin, and Egyptian.

Heng, Piphal

Piphal Heng
Department of Anthropology, University of Hawai'i at Manoa, Honolulu, HI, USA

Basic Biographical Information

Piphal Heng received his degree in Archaeology in 2002 from the Faculty of Archaeology at the Royal University of Fine Arts (RUFA), Cambodia. He joined the University of Hawai'i-Mānoa (UHM) Anthropology graduate program in 2007 and is currently a Ph.D. candidate working on his dissertation, which explores the political economy of the pre-Angkorian period using a comparative analysis of early state formation, temple economy, and settlement patterns in Southeast Asia, South Asia, and other regions.

Major Accomplishments

His work focuses on settlement pattern analysis, archaeology, history, epigraphy, and art history of Cambodia. Since 2003, he has participated in many national and international archaeological projects related to Iron Age, pre-Angkorian, and Angkorian archaeology, as well as work on

ceramic analysis, settlement patterns, inscriptions, history, art history, and political economy. He has presented at several major international conferences, and published the results of his research in conference proceedings. In addition to research and fieldwork, Piphal Heng instructed archaeology students at RUFA in 2005–2006 and on various archaeological field projects from 2004 to the present. He has also helped train staff from the Ministry of Culture and Fine Arts, APSARA Authority, and Preah Vihear Authority in GIS and cultural resource management, and has participated and designed multiple education campaigns to raise awareness on heritage protection and conservation to reduce looting and smuggling of archaeological materials in Cambodia.

Heng, Sophady

Sophady Heng
Ministry of Culture and Fine Arts, Phnom Penh, Cambodia

Basic Biographical Information

Sophady Heng completed his degree in the Faculty of Archaeology at the Royal University of Fine Arts in Phnom Penh in 1999. In 2005, he received a scholarship from the Erasmus Mundus Program to study in Paris for a M.A. degree in Quaternary and Prehistory, which was completed in July 2007.

Major Accomplishments

He has worked for the Memot Centre for Archaeology almost for 8 years. The Memot Centre was founded as a research institute for prehistoric archaeology in Cambodia and also as a training center for young Cambodian researchers to conduct archaeological research independently. During this period, he has participated in several excavations in and outside the country and organized many excavation projects, such as training programs for the students of the Faculty of Archaeology in the red soil region of Krek and Memot, Kampong Cham province. In 2002, he spearheaded the establishment of the Memot museum, which opened to the public in October 2002. Between 2007 and 2009, he served as the Deputy Director for the Department of Archaeology and Prehistory, Ministry of Culture and Fine Arts. In 2009 he was promoted to the position of Deputy Director General for Cultural Heritage, Ministry of Culture and Fine Arts and is responsible for collaboration with national and international institutions for archaeological research in Cambodia. Since 2007 he also has served as a lecturer at the Faculty of Archaeology, Royal University of Fine Arts in the field of Prehistory. Heng has participated in many national and international conferences, meetings, and workshops on archaeology, museum management, museum collections management, and conservation inside and outside Cambodia. He has written several articles about archaeological research in Cambodia and published in both Khmer and foreign journals. Recently, he worked on a salvage archaeology project at Kampong Preah temple, Kampong Chhnang province after a mobile phone company damaged a temple foundation during construction. In June 2012, he conducted preventive archaeology in the Sambor Prei Kuk area in the future site of a community market and tourism facility. This was a joint project between the Ministry of Culture and Fine Arts and the Ministry of Tourism with support from the Asian Development Bank. Between December 2012 and January 2013, he conducted a rescue excavation at the 12th century Banteay Chhmar temple complex in Thmor Pouk district, Banteay Meanchey province. The project was a collaboration between the

Ministry of Culture and Fine Arts, the Ministry of Transportation and Public Works, Kumho Industrial and Engineering (Republic of Korea) and the Embassy of the United States of America to Cambodia. In the course of the project, six complete burials were discovered in different locations associated with offering goods such as pottery vessels, iron tools, bronze objects and beads. Currently, he is a co-project organizer for the Mission Prehistorique Franco-Cambodgienne. This project was created in 2009, in collaboration with the Ministry of Culture and Fine Arts and the Muséum National d'Histoire Naturelle, Paris, France. This project focuses on prehistoric research in Cambodia and is currently investigating the site of Laang Spean. Excavation at Laang Spean, which began in 2009, will extend until 2016. An exhibit of work from the project is expected to be on display in the National Museum at Phnom Penh at the end of 2013.

Herculaneum

Louise Zarmati[1] and Aedeen Cremin[2]
[1]School of Education, University of Tasmania, Launceston, TAS, Australia
[2]Yass, NSW, Australia

Introduction

The archaeological site of Roman Herculaneum is in and partly under the modern Italian town of Ercolano in Campania, Southern Italy, 7 km west of Mount Vesuvius on the coast of the Bay of Naples. Herculaneum was destroyed and buried along with the nearby towns of Pompeii, Stabiae, and Oplontis in 79 CE when Mount Vesuvius erupted. Pompeii, Herculaneum, and Torre Annunziata were added to the UNESCO World Heritage list in 1997 because they "provide a complete and vivid picture of society and daily life at a specific moment in the past that is without parallel anywhere in the world" (UNESCO 2019).

Historical Background

According to legend, Herculaneum was founded by the Greek hero Hercules from whom it took its name. It may have been first settled by Greek traders during the sixth century BCE who also created the towns of Cumae, Pompeii, Poseidonia (Paestum), and Neapolis (Naples). Eventually it came under the control of the Samnites, an Oscan-speaking people from central Italy, who built the first temples and the "Samnite House," dated to the end of the second century BCE, which show strong Hellenistic Greek architectural influences. The Samnites were defeated by the Romans in the "Social War" of 90–89 BCE when all of Campania came under Roman control. Herculaneum became a *municipium* in 89 BCE and most of the town seems to have been built around that time on top of the existing town (Formola 2013). Remote-sensing techniques have shown that two large Roman houses – the House of the Mosaic Atrium and the House of the Deer – were built directly above the rainwater-cistern of some Samnite houses (Carrara et al. 2001). Other second-century remains have been found during drainage works (Camardo et al. 2012).

Pliny the Younger, writing about the eruption some 25 years after the event, describes what happened in Pompeii but does not mention its impact on Herculaneum. Volcanologists, however, have been able to determine that whereas Pompeii was first affected by a relatively slow "air-fall" or rain of ash and pumice, which enabled many to escape, Herculaneum, more exposed and closer to the volcano, was buried under a hot pyroclastic surge of ash, rock, and volcanic gas flowing at ground level. Studies of charred

wood show the temperatures was at least 400 °C (Sigurdsson et al. 1982). The surge was so powerful that it toppled buildings and moved large stone blocks 2–4 m. Most walls were left in place, but some buildings were stripped of their roof tiles. The hot surge kept moving swiftly towards the waterfront and, as it entered the sea, it caused the water to boil and give off steam explosions. People who sought escape via the beach or those sheltering in large waterfront chambers were overwhelmed by the heat and will have died instantly (Petrone et al. 2018).

Herculaneum was buried under 20 m of volcanic debris which set like concrete. The town of Resina (now Ercolano) was built on this layer sometime before 1000 CE. Local people, seeking to reach groundwater, dug shafts and tunnels through the volcanic layers deposited by successive eruptions – the most recent one being in 1631 CE (Maiuri 1932: 24). They soon discovered that they could extract good-quality marble for building or decoration and started "quarrying" below ground. Evidence of their activity was revealed in 2006, when excavations by the Herculaneum Conservation Project found an ancient shaft with footholds containing thirteenth-century pottery while another shaft contained quantities of sixteenth- and seventeenth-century ceramics (Camardo 2013: 330–335).

By the eighteenth century, Resina had become part of the Kingdom of Naples and courtiers were building large coastal villas in the areas. The owners of these villas noticed and quickly started to collect the beautiful marble and bronze objects brought to the surface during construction and well-digging operations. This gave a new impetus to the study of classical art and ushered in the age of Neoclassicism, which was as important as the earlier rediscovery of antiquity during the Renaissance. Among other things, it led to the tradition of the Grand Tour, which greatly encouraged the collection of antiquities and in turn led to the creation of some of the world's greatest museums (Dyson 2006, Chap. 5).

The finds were of such exquisite quality that in 1736, the 18-year-old Charles III, the first Bourbon King of Naples, sent his royal antiquary Count Marcello Venuti down into some tunnels that had been known to locals for about 20 years. They led to what had come to be known as the Temple of Hercules. Venuti found an inscription and realized it did not refer to a temple but to a theater that had been presented to the lost town of Herculaneum. He advised the king to immediately begin the process of uncovering the ancient remains. This work is accepted as being the beginning of modern archaeology "as the systematic and organised research of an ancient city" (Camardo 2013: 337).

In 1755, Charles III created the *Accademia Ercolanese* (Herculaneum Academy), to study and publish the finds. The results were nine superb volumes printed between 1757 and 1792 and given as royal gifts. By then, however, excavations had ceased as people living in the modern town feared their houses would collapse, and interest had shifted to Pompeii where the remains were more complete and more accessible (De Caro 2015). In the early nineteenth century, Napoleon Bonaparte conquered Italy and installed his youngest sister Caroline and her husband General Murat as rulers of Naples (1806–1815). As a patron of the arts and champion of Neoclassicism, Queen Caroline took an interest in the local archaeology, especially at Pompeii. When Napoleon was defeated, the Bourbons returned and one of the first acts of King Ferdinand IV was to create the Archaeological Museum at Naples, completing the work started by his father Charles III.

In 1828, small-scale excavations resumed at Herculaneum. Some work was done between 1869 and 1875 by Giuseppe Fiorelli, who was the director of excavations at Pompeii, but he too was forced to cease work due to the difficult nature of the deposit. The site was not reopened until 1927 when Amedeo Maiuri obtained funding from the Italian state under its dictator, Benito Mussolini (Camardo 2007). The aims of the new programs were to uncover a large part of the residential area of the town, then excavate the houses of the wealthy. Maiuri is estimated to have uncovered about one-fifth of the Roman town and was unusually diligent in publishing as he went. Herculaneum eventually became the archaeological showpiece of southern Italy for

the Fascist regime. Maiuri has been criticized for over-enthusiastic reconstructions but there is no doubt his work does convey some of the charm and beauty of the ancient port-city. The total excavated area today is 45,000 m^2, about one-tenth of Pompeii's (Biggi et al. 2014: 43).

Key Issues/Current Debates

One of the most important places in Herculaneum is the Villa of the Papyri, a magnificent seaside residence located to the west of the town. It was accidentally discovered in 1738 by well-diggers and painstakingly excavated by the engineer Karl Weber between 1750 and 1765. Weber drew up a plan which he consistently annotated over the years, creating what was for the time an unusually detailed archaeological archive. The first excavation was astonishingly lucky in that it uncovered a large rectangular garden edged by a "peristyle," a covered walkway opening through columned arches onto the garden and its central pool. This garden is enormous, 100 m long by 7 m wide, with 25 arches on the long sides and 10 on the short. Between the arches was a set of bronze statues of extraordinary quality – some of the finest Roman bronzes ever discovered, now a highlight of the Naples Museum. The excavated portions of the villa, extending over 250 m, are mostly public spaces – gardens, courtyards, and reception rooms (Maiuri 1932, Chap. 4). Owners and guests could admire the whole of the Bay of Naples from the Belvedere, a circular viewing pavilion built on a raised terrace at the western end of the gardens.

The name of the Villa derives from an even more significant find, a collection of 1840 fragments of papyrus scrolls, the only "library" ever recovered from the Classical world (Sider 2005). The texts are manuscripts written on sheets of papyrus pasted together to make scrolls which may be up to 15 m long. They were discovered tightly bound and packed into wooden boxes. All scrolls and boxes were carbonized by the eruption, so badly that at first some scrolls were discarded because they looked just like charred sticks. Although unrolling the scrolls is extremely destructive, dozens have been partly opened since 1754. Work is continuing on the texts from the Villa of the Papyri infrared lighting and multispectral imaging have been tried on already unrolled papyri with some success (Banerji 2013). A promising new technique is X-ray phase-contrast tomography (XPCT) which "can reveal various letters hidden inside the precious papyri without unrolling them" (Mocella et al. 2015).

Current thinking is that the fragments represent 650–700 "volumes," of which only about one-tenth are in Latin, the rest being in Greek, the literary language of the time (Cavallo 2014). Many of the works relate to Epicureanism, a Greek philosophical system which was popular in Naples, and of those thirty-six are by Philodemus of Gadara (c.110–c.30 BCE), an Epicurean who is known to have moved to Rome around 80 BCE. He was for a while the house-guest of Lucius Calpurnius Piso Caesoninus (c.100–c.43 BCE), father-in-law of Julius Caesar. In an irony of history, L.C. Piso is today remembered largely through the attacks of Cicero – a great orator and vindictive enemy – who excoriated him for having given up public duties for the pursuit of "the good life" and for pressuring Philodemus into writing poetry rather than philosophy (*In Pisonem,* 66-72; Delacy 1941).

From that connection, early scholars deduced that Piso, wealthy senator and patron of the arts, was the man most likely to have built the Villa. However, as Maiuri pointed out, the Villa was extended and decorated well beyond one man's lifetime, as the wall-paintings are in the Fourth Pompeiian Style and therefore date to the mid-first century CE. Furthermore, one recently deciphered scroll is a previously unknown work by Seneca the Elder, about the reigns of Augustus and Tiberius (27 BCE–37 CE). The implication is that the owners were sufficiently wealthy to continue collecting books and beautifying their mansion throughout the first century CE, but we still do not know for certain that the owners were the Calpurnius Piso family, as several other families have been suggested (Capasso 2010).

The Villa's private and domestic rooms still lie beneath the modern city. There are no plans to excavate it any further, for conservation reasons, and because there are serious problems with

flooding: the site which once overlooked the coast is today well below the water table. However, it has been reconstructed (with modifications) and can today be visited in Malibu, California, where it forms one-half of the Getty Museum, created by the oil tycoon Jean-Paul Getty to house his collection. The other half of the Museum is in Los Angeles in the Getty Centre (Lapatin 2018).

Written and archaeological evidence indicates that Herculaneum was a desirable town in which to live. Many high-status Romans either had permanent or seasonal residences there. Nonius Balbus, one-time governor of Crete and Libya, owned a luxurious house in Herculaneum and was so generous that the citizens erected an equestrian statue of him on the Terrace named after him (Map of Herculaneum). Portraits of his whole family were found in the *basilica*. Emperor Tiberius may have owned a large villa near Herculaneum and Emperor Titus may have visited Herculaneum shortly before the eruption. It is likely that his physician Apollinaris had recently been in the so-called House of the Gem because a scribbled message on the wall of the toilet reads: *Apollinaris medicus Titi imperatoris hic cacavit bene* [Apollinaris, physician of the emperor Titus, here shitted well] (Map of Herculaneum).

By the first century CE, Herculaneum had become a resort for rich Roman traders from nearby Neapolis. Located on a hill with waves lapping at its base, the broad coastline of Herculaneum overlooked the Sinus Cumanus (Bay of Naples) to the west and gave easy access to the sea. Mount Vesuvius stood about 7 km to the east. Via Antiniana, the main road connecting the major cities around the bay, ran nearby. Houses were built on terraces that extended to the edge of the cliff and vaulted passages led from the city streets to the waterfront. The views from these houses, such as must have been spectacular. Unlike Pompeii, which was enclosed by walls to protect the population from external threats, Herculaneum was a seaport that was open to the sea. The city was divided into rectangular blocks or *insulae*, "islands," now numbered I to VII, by a street system of north-south *cardines* and east-west *decumani* (Map of Herculaneum).

The catastrophic earthquake of 62 CE almost totally destroyed the town and some of its estimated 5000 residents had likely moved out by the time Vesuvius erupted in 79 CE. However, restoration work was being undertaken, for instance at the Temple of Venus, a Samnite foundation of the second century BCE with an inscription in Oscan. It had been remodeled during the reign of Augustus (r. 27 BCE to 14 CE) and in 70 CE two local donors, Vibidia Saturnina and Furius Saturninus, did further work, erecting portrait-busts of Titus and Domitian, the sons of the newly proclaimed Emperor Vespasian (Guidobaldi et al. 2009). There is also an inscription of Vespasian himself, dated 76 CE, which Maiuri took to be the dedication for a temple to Cybele, the Great Mother (Maiuri 1932, p. 42). The House of the Wooden Partition shows evidence of extensive restorations that took place before the eruption, possibly to repair the house after the earthquake (Map of Herculaneum), and the Villa of Papyri library may have been packed up into its wooden boxes for storage during renovations.

Although a great deal of excavation had taken place at Herculaneum, very few human remains were found until 1982 when workmen accidently discovered hundreds of bodies of victims while digging a trench across the ancient waterfront. Some skeletons were found on the beach, others had huddled together for shelter in the waterfront chambers. A 9-m boat and miniature horse were also found (Gore 1984). A total of 250 skeletons were removed at this time during careful excavation. They were in a superior state of preservation because they had been perfectly sealed within volcanic material that had set as hard as cement and had not been exposed to varying changes in temperature or humidity since the eruption. These skeletons were removed for laboratory analysis, and the bodies that tourists today stop to examine are actually fiberglass reproductions.

Separate studies of the human remains have been undertaken over the years. Dr Sara Bisel's 1980s analysis of the skeletons revealed there were not as many children present as would be expected in a normal population sample and offered three possible interpretations: first, that many of the young and old occupants of

Herculaneum "had escaped to Neapolis the night before"; second, that "another unexcavated chamber holds the 'missing' people" (to a certain extent this is correct); third, that the seemingly low number of infants and youth reflect a "radically decreasing" fertility rate in the population (Bisel and Bisel, p. 453). A second analysis, using newer scientific methods, was done in the 1990s by anthropologist Professor Luigi Capasso who found evidence of respiratory infections, potentially caused by indoor cooking.

Bisel's analysis also found the Herculaneans had a low incidence of tooth decay and tooth loss before death. Bisel explained this could be because they did not eat sugar and consumed a wide variety of seafood, an excellent source of fluoride, which helps prevent tooth decay. On the other hand, many others had worn down teeth and gum disease, probably as a result of eating bread made from very gritty flour. A more recent study of dental enamel found that people aged 14–20 and 25–35 showed nutritional deficiencies, which the authors attribute to these groups having lived through the 62 CE earthquake, in the case of the younger ones, who would been around 6 years old at the time (D'Anastasio et al. 2013). They hypothesize that there must have been another catastrophe around 53 CE, which affected the older group. This finding fits well with Luigi and Lorenzo Capasso's interpretation (1999) "that the earthquake of 62 AD resulted in high mortality."

Nearly half the people examined had some amount of osteoarthritis, and it is thought that about 80% would have done some hard, physical work. One may conjecture that the population at the time of the eruption may have been largely the lower classes or slaves, the wealthy having by then abandoned the earthquake-damaged city. In 2001, Petrone and colleagues suggested that the body postures of the Herculaneum victims suggest death by thermal shock rather than suffocation by noxious gases or ash, long thought to be the proximate cause of death for many at Pompeii. Their very short article mentioned flexion of body parts – such as curled toes – as well as charred bones as evidence of instantaneous death from fulminant shock, in which vital activity ceases within a time-span shorter than conscious reaction time. "Their soft tissues were vaporized . . . and the temperature then fell over a few tens of minutes, inhibiting the progress of the pugilistic stance and the disappearance of residual soft tissue."

Petrone and his colleagues have now confirmed their findings (Petrone et al. 2018). Numerous skeletons recovered from the waterfront chambers at Herculaneum were covered in mysterious red and black mineral residues. Based on mass spectrometry and microspectroscopy, the team hypothesizes that the residues represent iron from human blood that was exposed to extreme heat. The victims' blood literally boiled, causing the skulls to explode and brain matter to be replaced by ash. Flesh evaporated from the bones.

Future Directions

Today, Herculaneum is a huge open-air museum made up of hundreds of smaller micro-sites – houses, shops, fountains, streets, temples, theatres, *thermae* (public baths), and public spaces – each requiring constant maintenance and protection from the agents of destruction, both natural and human. For Herculaneum, as with Pompeii, the economic blessings of tourism are also a curse on its future existence. Constant maintenance and repair are required to hold off decay, disintegration, and destruction: collapsed roofing, water seepage, fading frescoes and plasterwork, sinking mosaic floors, crumbling carbonized wood, and the acidic droppings of pigeons nesting in roofs. In the last years of the twentieth century, two-thirds of Herculaneum had to be closed to the public because the site was collapsing (Povoledo 2012).

For this reason, the Herculaneum Conservation Project, an international collaboration funded by the Packard Institute, was set up in 2001 with the principal objective of providing support to the authorities to address the critical state of decline at the site (Herculaneum Conservation Project). The team was made up of public officers with a wider team of specialists who worked on

site all year round, creating a GIS system, mapping the areas of decay (over 15,000 square meters in 1 year) cataloguing architectural elements, archival photographs, etc. (Biggi et al. 2014). It is a public-private partnership that brings together the Packard Humanities Institute, a philanthropic foundation that works in Italy through the Packard Institute for Cultural Heritage, with the local heritage authority, the *Soprintendenza Speciale per i Beni Archeologici di Napoli e Pompei* (SNAP) and an international partner, the British School at Rome (Wallace-Hadrill 2009). The Project achieved remarkable results, opening up the town to visitors, but also making important new archaeological discoveries during maintenance, such as the drainage work which uncovered a second-century BCE floor, part of a structure which had been demolished in the early Imperial period (Camardo et al. 2012). In 2007, the Herculaneum Centre was created as a "sister initiative" by the Associazione Herculaneum. It has three partners: the Comune di Ercolano, SNAP and the British School at Rome. It is a community-based cultural association, aimed at better engaging the residents of Ercolano with the archaeological area, through oral histories, school programs, and workshops (Biggi et al. 2014).

An analysis of the building materials on the site by the Herculaneum Conservation Project revealed that around 50% of the wall structures at Herculaneum today are reconstructions dating to the 1930s Maiuri period. With the best of intentions, Maiuri's workers used cement – the state-of the-art restoration material at the time – to restore and reconstruct the fragile remains of walls and wall paintings. Over the years, the cement has deteriorated, resulting in further damage to the already fragile ancient wall paintings. Ironically, many of the conservation problems of today are the result of these well-meaning conservation works which aimed to create Herculaneum as an open museum and tourist attraction. The vision of Amedeo Maiuri, director of Pompeii and Herculaneum from 1927 to 1962, was to turn Herculaneum into a "living museum" where the visitor could experience the feeling of stepping back in time (Wallace-Hadrill 2011: 317). Much of the current restoration focuses on using new technologies and materials to undo damage caused by these previous attempts at conservation. Debates and dilemmas continue about how Herculaneum should be managed: should excavation be resumed or should the site be left for future generations to examine with more sophisticated and less destructive scientific and technological methods? The exceptional work of the Herculaneum Conservation Project exemplifies the effectiveness of the current policy of conserving and restoring rather than extending excavation, so the site can be safely visited in the present as well as the future.

Heritage and Archaeology

Tadhg O'Keeffe
School of Archaeology, University College Dublin, Dublin, Republic of Ireland

Introduction

Heritage is, literally, that which has been, or may be, inherited. Although the concept of *inheritance* has considerable antiquity, the word *heritage* is of western and medieval origin, and applied originally to property and land. Insofar as there is a

shared understanding of what constitutes heritage in modern western society, it is ostensibly a broader and more democratic understanding than it once was, encompassing both tangible inheritances, "natural" (not man-made, though not unnecessarily unaffected by human agency) and cultural, and intangible inheritances (such as language, dance forms, craftsmanship, and ritual practices, passed down behaviorally from generation to generation). But heritage is far from an uncontested realm, and it is arguable that an uncontested consensus with respect to definition and constitution cannot be conceived of. This is because heritage is entirely a cultural construct, originating in "the West." Consciousness of heritage as a "thing" is itself a heritage. Though not negated, the concept of *global cultural heritage*, of an inheritance of which some value is shared by mankind, is rendered somewhat problematic by that fact. So too, for that matter, is the concept of a *natural* heritage, since nature is itself a cultural construct. To debate what constitutes heritage in the first place, and to debate the range of possible engagements with heritage (as signified by such terms as "protection," "destruction," and "preservation"), is to engage, then, in a conversation about humankind itself. The relative ease with which the idea of a universal and cross-cultural heritage might be deconstructed and some of its inherent ideological dangers exposed do not mean that heritage does not matter profoundly. On the contrary, forms of identity are defined almost everywhere by reference to some conception of heritage, while tourism, one of the key drivers of economic wealth nationally and internationally, rotates around it.

The actual constitution of heritage might be contested, but as a construct it has long been "black-boxed." The question "what is heritage?" – the question at the heart of virtually every heritage-related initiative in the past half century and usually explicitly so – might suggest that the opposite is the case, that its very essence is under constant scrutiny. But close examination of the contexts in which that question is asked usually reveals the expectation of an actual answer: in other words, the question is asked not to find out if heritage *is*, in an ontological sense, but to find out *what* it is. Indeed, one could argue that heritage, perhaps like all cultural constructs that have been "black-boxed," is central to two conversations in two different languages: one is a conversation about philosophy and epistemology and is predicated on the knowledge that heritage has no ontological reality, while the other is a conversation that may well acknowledge the value of philosophical reflection but has as its more urgent agenda the need to find out what is in the heritage box so that it can be saved from damage, theft, or decay.

Archaeology is historically the key discipline with investigative and curatorial authority in the realm of tangible, cultural heritage of protohistoric and prehistoric antiquity. It goes without saying that it occupies this position historically in western society and western thinking and that it is western heritage to which it claims specific ownership of access; like heritage itself, archaeology is after all a product of "western culture" as vaguely defined. But it has historically claimed jurisdiction over the retrieval and interpretation of heritage data outside "the West" as well, some of that data being of relatively recent vintage in terms of absolute chronology (but still "prehistoric"). Anywhere in the world with tangible cultural relics belonging to historically undocumented pasts – another western concept – will find that archaeology is not only interested in it but will find a way to know about it. If the discipline's grasp has always been truly global on the horizontal axis of geographic scale, it is increasingly, thanks to its new interests in the heritages of modernity and contemporaneity, just as extensive on the vertical axis of temporality.

It is debateable whether the relatively new "heritage professions," most of them linked to accredited academic courses (in Cultural Heritage Management, Museum Studies, and so on) and possessed of strong managerial dimensions, challenge archaeology's historic hegemony over tangible heritages from the distant past or indeed its more recent claims to some authority over more recent tangible heritages. To a degree, that hegemony is, like heritage itself, "black-boxed." If tangible heritage is conceptualized as possessing an inherent archaeology, regardless of its actual

date, the discipline of archaeology can claim in theory to give at least associate membership to the entire cadre of heritage professionals, whatever their training (and whether they like it or not). One might argue that archaeology has actively claimed its hegemonic position by redefining itself: just as the constitution of tangible cultural heritage expanded to include "things" as diverse as the tourist landscape of Las Vegas or the Apollo Mission detritus on the Moon (Gorman and O'Leary 2007; Weaver 2011), archaeology itself expanded to meet it. There is no longer anything that the archaeologist regards as out of bounds, even (and increasingly) the intangible.

However it is defined, archaeology's relationship with its heritage subject matter has changed in one very radical way in recent decades, although one hesitates to claim that the change has been effected universally. Readers of this encyclopedia, who constitute a "knowledge community" in themselves and who are likely to be as "western" as the discipline of archaeology, will know that it no longer claims innocently to be a disinterested scientific praxis, simply retrieving and making sense of tangible heritages. It now self-identifies as a social praxis and highlights its own social responsibilities. Few would contest this as a positive development. Practitioners from western countries are rightfully mindful that archaeological investigations of heritages in non-western places and contexts can be construed as colonial, and many would identify archaeology (with anthropology) as *historically* complicit in the "othering" of the non-western people (Trouillot 2003). Practitioners in western countries are also rightfully mindful that archaeological investigations more locally of the heritages of minority or politically disenfranchised communities can be construed as elitist and, in the cases of communities originating in historic colonial expansions, neocolonial. There is a conviction within the global profession, though, that archaeology itself is fundamentally benign as both a practice and an intellectual pursuit and that potential allegations of neocolonialism or elitism are circumvented if all communities and societies are encouraged to engage positively with their own heritages on their own terms. Archaeology is, in this view, an agency which sensitively and reflexively empowers communities by providing strategies by which they can access their own pasts – their own heritages – in manners and for purposes which are culturally appropriate to them.

Definition

Dictionary definitions of heritage as "that which has been or may be inherited; any property, and esp. land, which devolves by right of inheritance" and/or as "that which comes from the circumstances of birth; an inherited lot or portion; the condition or state transmitted from ancestors" (OED Online 2012) disguise the struggles which national and international agencies, charged with oversight and management of heritage, have experienced over decades to arrive at an adequately broad definition. The modern (post-Venice Charter, 1964; see below) history of international heritage organizations and movements is in part a history of definition searching. The general tendency in every new initiative has been towards broadening the definition. One can see this by comparing definitions between two benchmark documents 40 years apart. In 1965 the Constitutive Assembly of ICOMOS (the International Council on Monuments and Sites), a non-governmental international organization, defined heritage solely in terms of monuments and sites and excluded conventionally defined archaeological collections precisely because ICOM (the International Council of Museums) was regarded as the authoritative body. By contrast, in 2005 the *Council of Europe Framework Convention on the Value of Cultural Heritage for Society* (the so-called Faro Convention) dealt with the broader category of "cultural heritage" which it defined as "a group of resources inherited from the past which people identify, independently of ownership, as a reflection and expression of their constantly evolving values, beliefs, knowledge and traditions, [and which] includes all aspects of the environment resulting from the interaction between people and places through time." It defined "a heritage community" as one

"consisting of people who value specific aspects of cultural heritage which they wish, within the framework of public action, to sustain and transmit to future generations."

These two definitions reflect a desire among international heritage agencies to achieve politically neutral definitions. They, and other definitions like them, have been generated in contexts of international debate about heritage and are subscribed to in broad principle in many countries, but there is little standardization of definition between countries, a fact which has long hampered the effective implementation of many heritage charters. Thus, for example, the Australian view of heritage privileges "place, cultural significance and fabric," the Canadian view privileges "material culture, geographic environments and human environments," while the Chinese view privileges "immovable physical remains" (Ahmad 2006: 299). National definitions of heritage reflect national intellectual traditions and political needs. National agendas always trump international aspirations.

Not all agencies have been as sensitive as UNESCO (the United Nations Educational, Scientific and Cultural Organization), ICOMOS, or the Council of Europe in defining heritage. For example, in 2001 the World Monuments Watch, a nonprofit heritage organization based in New York, added the recently created Ground Zero (the former World Trade Center site) to its global list of 100 sites which it regarded as needing protection. It was, as that organization proclaimed, included as one of "our landmarks," alongside Mostar Bridge and the Bamiyan Buddhas, which "have become prized targets for terrorists because they are what defines the cultures, ideals, and achievements of the people who created them, who use them, who live with them." The description of these places and sites as "*our* landmarks" and the use of the term "terrorists" capture with an economy of words precisely what international heritage agencies attempt to avoid. In any case, the World Trade Center prior to its destruction was a place of international finance and business and has little to do with the "culture and ideals" of Americans (O'Keeffe 2010).

Historical Background

Although the origins of the modern concept of heritage are to be found in the context of nineteenth-century modernity in western Europe (Smith 2006: 16–22; Fig. 1), the period of greatest expansion internationally of heritage consciousness was after World War II, particularly from the 1960s. A key event was the decision by the Egyptian government to build the Aswan High Dam, thus flooding the valley containing the Abu Simbel and Philae temples. UNESCO launched a successful international campaign to raise money for safeguarding this heritage. The temples were dismantled and reassembled elsewhere. Subsequent UNESCO projects, similarly conceived, ensured the preservation of Mohenjo-daro in Pakistan and the Borobudur temple compounds in Indonesia.

Briefly, UNESCO remains the leading force in the development of practices for the protection of cultural heritage. Member states (of which there are 196) are required, though only at the cost of

Heritage and Archaeology, Fig. 1 Visitors to a reconstructed Egyptian tomb in the Bibliothèque nationale de France in the mid-nineteenth century. (From Joanne 1850: 223)

censure, to honor the contents and recommendations of its various conventions, declarations, and guidelines. UNESCO maintains a list of what it designates World Heritage Sites, places both "natural" and "cultural" which it regards as having special significance to the global community. This list, which has 962 "sites," 77% of them "cultural," spread across 157 states, is overseen by its World Heritage Committee, the elected membership of which is drawn from the 190 countries which have signed and ratified the 1972 *World Heritage Convention (or Convention Concerning the Protection of the World Cultural and Natural Heritage)*. Whereas member states are represented on UNESCO's World Heritage Committee, membership of ICOMOS is comprised of individuals and institutions specializing in conservation in the broadest sense. ICOMOS advises UNESCO on World Heritage Sites.

Between them, UNESCO and ICOMOS are responsible for most of the thirty-odd charters and other documents created for international reference since World War II (or, more specifically, since the *Hague Convention* of 1954). Key documents created in these 60 years include (after Ahmad 2006, with additions):

- *International Charter for the Conservation and Restoration of Monuments and Sites*, CATHM, 1964 (http://www.icomos.org/charters/venice_e.pdf)
- *Recommendation Concerning the Preservation of Cultural Property Endangered by Public or Private Works*, UNESCO, 1968 (http://unesdoc.unesco.org/images/0016/001601/160145eb.pdf)
- *Resolution of the Symposium on the Introduction of Contemporary Architecture into Ancient Groups of Buildings*, ICOMOS, 1972 (http://www.international.icomos.org/publications/93towns7e.pdf)
- *Convention Concerning the Protection of the World Cultural and Natural Heritage*, UNESCO, 1972 (http://whc.unesco.org/archive/convention-en.pdf)
- *Recommendation Concerning the Safeguarding and Contemporary Role of Historic Areas*, UNESCO, 1976 (http://unesdoc.unesco.org/images/0011/001140/114038e.pdf#page=136)
- *Charter for the Conservation of Places of Cultural Significance*, Australia ICOMOS, 1979, revised 1999 (http://australia.icomos.org/wp-content/uploads/BURRA_CHARTER.pdf)
- *Charter for the Conservation of Historic Towns and Urban Areas*, ICOMOS, 1987 (http://www.international.icomos.org/charters/towns_e.pdf)
- *Charter on the Preservation of Historic Gardens*, ICOMOS, 1982 (http://www.international.icomos.org/charters/gardens_e.pdf)
- *Guidelines for Education and Training in the Conservation of Monuments, Ensembles and Sites*, ICOMOS, 1993 (http://www.getty.edu/conservation/publications_resources/research_resources/charters/charter52.html)
- *Nara Document on Authenticity*, Japan and UNESCO, 1994 (http://whc.unesco.org/uploads/events/documents/event-833-3.pdf)
- *Charter on the Protection and Management of Underwater Cultural Heritage*, ICOMOS, 1996 (http://www.international.icomos.org/charters/underwater_e.pdf)
- *Principles for the Recording of Monuments, Groups of Buildings and Sites*, ICOMOS, 1996 (http://www.icomos.org/charters/archives-e.pdf)
- *Principles for the Preservation of Historic Timber Buildings*, ICOMOS, 1999 (http://www.international.icomos.org/charters/wood_e.pdf)
- *Charter on the Built Vernacular Heritage*, ICOMOS, 2000 (http://www.international.icomos.org/charters/vernacular_e.pdf)
- *Convention on the Protection of the Underwater Cultural Heritage*, UNESCO, 2001 (http://unesdoc.unesco.org/images/0012/001260/126065e.pdf)
- *Charter for the Interpretation of Cultural Heritage Sites*, ICOMOS 2002 (http://icip.icomos.org/downloads/ICOMOS_Interpretation_Charter_ENG_04_10_08.pdf)
- *Framework Convention on the Value of Cultural Heritage for Society, The Council of Europe*, 2005 (http://conventions.coe.int/Treaty/EN/Treaties/Html/199.htm)

Archaeology features in most of them, but, surprisingly, perhaps, one cannot map particularly

well its own historical development as a heritage praxis, or its historical relationship with the concept of heritage, through an interrogation of their texts. In the 1964 *Venice Charter*, at the head of the list above, the disciplines of archaeology and history are given equal rank; the Charter does refer to the need for archaeological excavation to accord with agreed international scientific standards, but does not otherwise privilege the subject. The 1968 Recommendation which followed also mentioned archaeology but placed it among rather than in a privileged position within other disciplines and practices. It advocated, for example, "the conservation and the protection of monuments and historic, artistic, *archaeological* and scientific sites" and asserted that "the services responsible for the safeguarding of cultural property should be adequately staffed with the specialists required for the preservation or salvage of cultural property endangered by public or private works, such as architects, urbanists, *archaeologists*, historians, inspectors and other specialists and technicians." By the time of the *Faro Convention* of 2005, the last item on the list above, archaeology is not mentioned by name at all.

Key Issues

The key issues in heritage, certainly from an archaeological perspective but probably from every perspective, can be grouped under three headings: ethical, practical, and theoretical. Separating them like this suggests three different bundles of issues to be addressed, but all three are interconnected, with ethical concerns probably overarching all others. The application of theories and practices of heritage preservation and conservation, and of presentation, all require an advance rapprochement with the ethics of engaging in anybody's heritage or any group's heritage other than one's own.

In part, the ethical concerns are with respect to ownership of heritage. The role of western archaeological agencies, or indeed of archaeology as a western agency, in investigating heritages overseas, and the potential ethical conflicts, has already been alluded to above, but the issues extend also to the investigation of certain heritages within those western places themselves. The rights of communities to their own heritages, regardless of geographic location, are now recognized. In the United States, for example, initiatives addressing the specific concerns of indigenous peoples relating to cultural resource management have been in place since the mid-1970s, while a 1992 amendment to the *National Historic Preservation Act* allowed tribes to establish their own Tribal Historic Preservation Offices, enabling direct involvement in heritage preservation on tribal lands (Nicholas 2008). The treatment of burials is no longer the point of conflagration that it once was. The sort of controversy generated by the American burial ground (Epperson 1997) is unlikely to be repeated. Sometimes, though, the identification of rightful claimants to a heritage is a problem. In some cases, as with Stonehenge in the mid-1980s, there is no descendent community for an ancient heritage, but claims are still made for ownership (Chippendale 1986). In other cases, there is a descendent community, but claims from outside that community are made, as at Chaco Canyon (Finn 1997); identifying some heritage as global in significance opens a door for arguments to be made that everybody should have rights of access and intervention. In other cases again, communities with specific heritages have not sought heritage protection, and no offer of protection is made to them, thus creating the possibility that a heritage to be valued in the future will be destroyed in the present (Fig. 2). Ownership is one part, albeit a significant one, of a larger ethical-practical matrix. Imbricated with it is the problem of attaching a notional global heritage value or significance value if the communities whose heritages are being evaluated (such as "ethnic groups," as loosely defined) do not subscribe culturally to such metrics. This challenge trickles down to micro-level where tension can exist between a collective with a heritage that it desires not to retain and those within the heritage profession who might regard that same heritage as worthy of protective intervention (Fig. 3).

Once issues of the ownership and significance value of heritages are dealt with, there is a further

Heritage and Archaeology, Fig. 2 Moore Lane, Dublin (2009). One of the first sites of worship of Dublin's Nigerian community, it is typically in a back-street location. Will future generations of African-descended Irish people lament the loss of the site of the Tower of Power Pentecostal church? (Photo: T. O'Keeffe)

Heritage and Archaeology, Fig. 3 The remains of the Magdalene laundry attached to the Gloucester Street convent, Dublin (2009). The abuses (psychological, physical, sometimes sexual) suffered by women in such laundries are now public knowledge. According to local informants, there is no desire among survivors for their experiences to be memorialized in the preservation of this ruin, yet it represents an important, if very dark, passage in modern Irish history. (Photo: T. O'Keeffe)

area of on-going concern: presentation and interpretation. Establishing professional and ethical standards in tandem in these areas was central to the ICOMOS *Charter for the Interpretation of Cultural Heritage Sites*, drafted in 2002 by the Ename (Belgium) Center for Public Archaeology and Heritage Presentation. Cultural heritage site is defined in this context as broadly as possible: "a locality, natural landscape, settlement area, architectural complex, archaeological site, or standing structure that is recognized and often legally protected as a place of historical and cultural significance." In meeting its goal of establishing "international standards and guidelines for authenticity, intellectual integrity and sustainable development in the public preservation of archaeological and historical sites and landscapes," it distinguished between *interpretation* ("the full range of potential activities [including "professional and popular publications, on-site

installations, community activities, and so on"] intended to heighten public awareness and enhance understanding of cultural heritage site"), *presentation* ("the carefully planned communication of interpretive content through the arrangement of interpretive information, physical access, and interpretive infrastructure at a cultural heritage site"), and *interpretive infrastructure* ("physical installations, facilities, and areas at a cultural heritage site that may be specifically utilised for the purposes of interpretation and presentation"). Most interestingly, though, the same Charter defined *site interpreters* as "staff or volunteers at a cultural heritage site who are permanently or temporarily engaged in the public communication of information relating to the values and significance of the site." The information they communicate to "the public," in other words, is not information about the heritage but about its evaluation. The follow-up to the Charter, the *Charleston Declaration on Heritage Interpretation* (2005), suggested an "operational difference between *Presentation* and *Interpretation*" describing the former as a "one-way mode of communication" in which "scholars, design firms, and heritage professionals" (note the order of listing and the distinction made between the first and third) are involved and describing the latter as "the totality of activity, reflection, research, and creativity stimulated by a cultural heritage site" (www.enamecharter.org/downloads/charleston_declaration.doc). But it elided, arguably, the problem raised by the concept of the *site interpreter* who mediates a site's significance.

Among many key issues of a practical nature for scholars and heritage professionals, three can be picked briefly as representative. One is dealing with the impacts of so-called heritage tourism (see, e.g., Poria et al. 2003). The commodification of the past requires some accommodation between those involved in commerce and those concerned with conservation. Heritage tourism that is not carefully regulated damages more than just the physical: it can limit the sense of stakeholding among those whose heritage is commodified. A second issue is the tension between heritage sites in urban areas and the simple modern economic functioning of those urban areas. There is a difficulty of "translating traditional conservation concepts. . . to the diverse and dynamic urban contexts urban WHS [World Heritage Sites] represent" (Pendlebury et al. 2009: 349). A third issue is the problem of heritage theft. This has been addressed many times in the past 60 years, going back to the *Hague Convention* (http://unesdoc.unesco.org/images/0008/000824/082464mb.pdf). Yet, in more recent times, ICOM has had to issue what it described as *Red Lists* in which are classified the endangered categories of archaeological objects or works of art in the most vulnerable areas of the world, in order to prevent them being sold or illegally exported (http://icom.museum/programmes/fighting-illicit-traffic/red-list/). There are lists for *African Archaeological Objects* (2000), *Latin American Cultural Objects* (2003), an *Emergency Red List of Iraqi Antiquities at Risk* (2003), *Afghanistan Antiquities* (2006), *Peruvian Antiquities* (2007), *Cambodian Antiquities* (2009), *Endangered Cultural Objects of Central America and Mexico* (2009), an *Emergency Red List of Haitian Cultural Objects at Risk* (2010), *Chinese Cultural Objects* (2010), *Colombian Cultural Objects* (2010), and an *Emergency Red List of Egyptian Cultural Objects at Risk* (2011).

International Perspectives

UNESCO, the institutional epicenter of heritage history, and other international agencies have had considerable success in getting nation states to conceive of their national heritages as part of a greater, global heritage matrix and in encouraging most of those nation states to sign up to what are essentially covenants to protect the future(s) of heritage. But proposals from the international community to internationalize protection strategies for heritage have not always been compatible with national cultural traditions or chimed with national interests. The response to UNESCO's 1970 *Convention on the Means of Prohibiting and Preventing the Illicit Import, Export and Transfer of Cultural Property*, mentioned above, illustrates this point very well. Declarations and

reservations came from 18 countries, most expressing reservation. Three examples from different corners of the world can be picked out as representative. They are of historic interest now, but they underline a point that is far from historic: the tension that exists, almost inevitably, between the aspirations of internationalization and national self-interest. For Australia came the declaration that it is not at present in a position to oblige antique dealers, subject to penal or administrative sanctions, to maintain a register recording the origin of each item of cultural property, names and addresses of the supplier, description and price of each item sold and to inform the purchaser of the cultural property of the export prohibition to which such property may be subject. Australia therefore accepts the Convention subject to a reservation as to Article 10, to the extent that it is unable to comply with the obligations imposed by that Article.

The Union of Soviet Socialist Republics declared that the provisions of Articles 12, 22 and 23 of the Convention on the Means of Prohibiting and Preventing the Illicit Import, Export and Transfer of Ownership of Cultural Property, providing for the possibility for the contracting parties to extend its application to the territories for the international relations of which they are responsible, are outdated and contrary to the Declaration of the United Nations General Assembly on the Granting of Independence to Colonial Countries and Peoples (resolution 1514/XV of 14 December 1960).

A third example is the declaration by the Republic of Guatemala that in conformity with the Fundamental Statute of Government, monuments and archaeological vestiges are the property of the nation and that, furthermore, national law prohibits the unauthorized export of property constituting its cultural wealth, makes an express reservation concerning paragraph (b) (ii) of Article 7 of the Convention to the effect that it does not consider itself obliged to pay any compensation to any person or persons holding cultural property that has been looted or stolen in Guatemala or exported illicitly to another State Party and that, at the request of the Government of Guatemala, has been the subject of appropriate steps for its confiscation and/or restitution by that other State Party. In any case, the Republic of Guatemala does not consider that the purchase of property forming part of its cultural wealth is in good faith solely through having been made in ignorance of the law. Concerning Article 3 of the Convention, the Republic of Guatemala shall also consider to be illicit the import and transfer of ownership of cultural property effected contrary to the national provisions in force that are not in conflict with the provisions of the Convention.

These very tensions are especially in evidence where underwater cultural heritage is concerned. The UNESCO *Convention on the Protection of the Underwater Cultural Heritage* aimed to provide an international legal framework for the protection of shipwrecks and other cultural remains located in international waters. It was adopted in 2001, but some major maritime states opted not to adopt it. Their principal legal concern was that their rights, under the UN *Convention on the Law of the Sea* 1982 (LOSC), would be compromised by signing up to the UNESCO Convention. A principal ethical concern was the protection offered by the Convention to sunken warships (Fig. 4). When afloat, such ships have a special legal status; they are afforded immunity from the jurisdiction of any state other than the flag state. Some maritime states insist that such protection survives their sinking. This issue has a particular currency: the Convention protects heritages which have been underwater for at least a century. The *Titanic* has recently fallen within its embrace; in 2014 the first of the World War underwater wrecks will be covered by the Convention (Dromgoole 2012).

Future Directions

The observation was made above that heritage is a topic in two conversations in two different languages, one philosophical and epistemological and the other concerned with practicalities. The two conversations converge on the issue of ethics, in that those engaged in the first recognize the ethical problems inherent in legislating for concepts inherently unstable, and those in the second

Heritage and Archaeology, Fig. 4 Tourists visit the *USS Lexington*, Corpus Christi, Texas (2008). (Photo: T. O'Keeffe)

understand how negotiation with ethics is necessary for practical action to be taken on heritage. Neither of these conversations will stop; the challenge into the future is to make their languages more compatible with each other.

Heritage and Higher Education

Karina Croucher
Department of Archaeology, School of Arts, Languages and Cultures, University of Manchester, Manchester, UK

Introduction

In the UK, Archaeological Higher Education courses have, in recent years, incorporated a growing component of heritage studies, and in addition, heritage is now often separated from archaeology as its own distinct discipline of study. The question of how closely linked the disciplines should be is rarely addressed, although many recognize the interdisciplinary nature of their research in these fields. This section will discuss the traditional "education versus training" debate, which sees a dichotomy of practice between academics and education, and professional archaeology, with a segregation between education and practice. Epistemologies of practice are also discussed, where the demographics of education contrast with those of the profession, especially at higher levels, a pattern also seen in other arts areas of study and practice. Finally, the importance of sociopolitics and the role of "alternative narratives" in heritage education and management will be considered.

Key Issues

Education Versus Training

In a current climate of financial downturn, the disciplines of archaeology and heritage face challenging times. The role of education is ever-more vital, securing the future knowledge base of the next generation of professionals, while also fundamental for nurturing an understanding of the value of the past and its role in life today. However, the heritage sector, including professional archaeologists, and academia debate the responsibilities for vocational training: the "education

H

versus training" debate (Collis 2000; Aitchison 2004; Hamilakis and Rainbird 2004: 52). Archaeological employers argue that graduates are becoming increasingly ill-equipped for a career in field archaeology (Aitchison 2004), and at the heart of the discussion is the issue of whether universities are responsible for producing professional archaeologists, equipped with the field knowledge to work effectively on archaeological sites, or whether vocational aspects of training should fall under the remit of employers. A factor in the debate is the role of universities in ensuring the employability of all of their graduates, whether they decide to pursue archaeology or some other career, requiring a broader focus on employability skills, rather than simply archaeological techniques. With new jobs in archaeology predominantly awarded to those with degrees, there are responsibilities for both the education and professional sectors. Two major research projects which have investigated fieldwork training in the UK (Croucher et al. 2008; Everill and Nicholls 2011) have called for a closer relationship between the profession and universities, with the most productive training projects frequently resulting from collaboration between field units and universities (Croucher et al. 2008). It is also clear that archaeological training equips graduates with a range of transferable skills (e.g., analytical skills, interpretative abilities, communication skills, and team working) which are valuable to employers outside of archaeological careers.

Recent research by Everill (2009) has investigated the working conditions of archaeologists, observing a profession which is repeatedly subject to low-pay and poor conditions, further emphasizing a gap between the profession and academia. As the professional sector faces increasingly diminished funds in a competitive environment, the exploitation of excavators is frequently inherent in contracts of work. Schlanger and Aitchison (2010) describe a crisis in archaeology in the UK; a change in policy, brought in by a new coalition government, has resulted in cuts to publically funded projects, rather than the previous strategy of investment in order to drive growth. The government strategy, placed in its context of global economic downturn, has contributed to a diminishing construction industry, directly impacting on the archaeological sector (Aitchison 2010), alongside dramatic cuts in funding to education and heritage (Everill and Nicholls 2011). Schlanger and Aitchison describe the current situation as affecting four areas within archaeological and heritage research and practice: research funding and its priorities; professional employment; conservation and public outreach policies; and heritage management, policies, and legislation (2010: 10), themes which are interdependent and together their plight spells an overarching crisis for the profession and education. Aitchison estimates that in the UK, an equivalent of one in every six jobs in archaeological fieldwork was lost between 2007 and 2009, a decline of around 10% in the archaeological sector as a whole (2010: 26). Not only is the situation leading to an employment crisis, but is also resulting in the burgeoning of skills, knowledge, and experience from archaeological practice (Aitchison 2010; Schlanger and Aitchison 2010). With diminishing archaeological jobs, it is clear that only the most proficient of graduates will secure their place in an archaeological career, yet a career that is dominated by low salaries and poor conditions (Everill 2009). As the training of future generations of archaeologists and heritage sector professionals is fundamental to the continuity of the heritage sector, the way forward lies with a closer allegiance and understanding between the sectors of education and the profession. The effects of the financial crisis are echoed across the globe (see Schlanger and Aitchison 2010 and chapters within).

Demographics of the Profession

Alongside the decline in career opportunities, the demographics of those working in the sector remains a concern. Aitchison and Edwards' (2008) *Profiling the Profession* research describes how the profession is still dominated by a male workforce. It is apparent that within Higher Education, there is greater equality between the sexes at undergraduate level, yet the traditional picture

highlighted by Gero in 1994, of gender inequalities within archaeology, remains the same, with a narrowing of the career pyramid for female opportunities throughout the various levels of education and employment, with ultimately few female archaeology professors in the UK (see also Cant 2009). This worrying trend is not only evident with gender divides but permeates into fields of ethnicity, disability, and class, with the profession still remaining predominantly white, male, able-bodied, and middle class; 99% of the UK sector are white, and 98.4% able-bodied (Aitchison and Edwards 2008). The situation, writes Pope (2011), is in part attributable to a change in demographics and expectations during the 1950s in Britain, leading to the professional fast-tracking of many (male) Cambridge graduates into professorships, a legacy which still impacts on the discipline today. Highlighting the current indiscrepancies in our professional and academic workforce is essential if the situation is to be rectified and the heritage sector is to become more representative of our modern population. This is a situation which has been of concern for a number of years, with McGuire and Walker observing class inequities in archaeology in 1999, with inequalities relating to class as well as gender. While the current situation in terms of class is more difficult to define, research is demonstrating that the gender imbalance in the heritage sector remains a challenge. An investigation by the Cultural Leadership Programme (2008) into the arts and heritage sector in the UK confirmed the continuing situation. While in 2006 52% of the Cultural Heritage workforce were female (Dodd et al. 2008: Table 4), the percentages for executives were 62% male and 38% female (Dodd et al. 2008: Table 6). This figure does not seem so problematic until the sizes of companies with female executives are compared; companies with an all-female executive body make up 82% of those businesses employing 0–4 members of staff, with companies employing larger workforces dominated by male executives (Dodd et al. 2008: Table 8). Thus, female executives, where they are present, are predominantly situated in the smallest organizations.

Future Directions

It is clear that the heritage sector faces great challenges ahead. It must become more commercially viable if it is to exist in today's climate of cuts and financial downturn. Education is key, not just of tomorrow's professionals but of the whole population in securing its understanding of the value of the past. In order to increase participation in heritage projects, it can be argued that the sector's demography needs to be more diverse to represent a multicultural Britain. This also includes the acceptance of alternative narratives of the past, which enable different voices to be heard and accept different claims on heritage, rather than offering a single, unified interpretation of monuments, archaeological sites, and places. The acceptance of difference pasts offers a forum for greater engagement in archaeology and heritage (Joyce 2002; Mapunda and Lane 2004). Indeed, a multiplicity of meaning no doubt existed in the past as it does in the present. Finally, these challenges are not unique to Britain; they place Britain in a global context and in an international community, which is striving to communicate the past and the relevance of heritage to lives and communities today and in the future.

Heritage and Public Policy

William H. Jansen II
Department of Anthropology, University of North Carolina at Chapel Hill, Chapel Hill, NC, USA

Introduction

The policy environment is a crucial factor affecting cultural heritage and its preservation in local, national, and international settings. It is policy that sets goals, determines courses of action, and establishes common principles for use in cultural heritage management.

Definition

Definitions of public policy vary considerably and it could be argued that there is no universally accepted definition. However, most generally acknowledge that policy, although usually made or initiated by government, is interpreted or implemented by both public and private sector actors. In the context of cultural heritage, policy can be defined as courses of action – identified or undertaken by governments (national, subnational, or local), organizations (public or private, multinational, national or local) and private sector entities or civic groups – to preserve, protect, maintain, or manage tangible or intangible aspects of cultural heritage.

Historical Background

Cultural heritage policies in use today can be categorized into at least two general categories: (1) conceptual or definitional policies; and, (2) policies guiding program action or implementation. Policies in either category typically address approaches for preserving or protecting heritage and/or ways for responsibly combining cultural heritage and economic interests (such as cultural resource management and tourism).

Conceptual or Definitional Policies

Some policies or statements of heritage preservation objectives are long-standing and often emerged from a process of national dialogue. One that has become a model is the United States (U.S.) *National Historic Preservation Act* of 1966 (Public Law 89-665) which amounts to a national declaration of policy for preservation that applies to several government agencies and organizations. The *National Historic Preservation Act* also authorized the National Register of Historic Places in the USA as part of the effort to identify and protect the country's historic and archeological resources. As of 2010, the Register had over 86,000 properties listed. Although a model that may be emulated by others, the venerable public policy, that is, the *National Historic Preservation Act*, was amended 18 times between 1966 and 2006 – illustrating that public policies for cultural heritage are evolving and changing to meet the needs of times or circumstances.

Within the international arena, a major force for cultural heritage issues in public policy has been the United Nations Educational, Scientific and Cultural Organization (UNESCO). The *World Heritage Convention* of 1972 linked the concepts of nature conservation and the preservation of cultural properties (United Nations Educational, Scientific and Cultural Organization (UNESCO) 1972). This convention has guided the foundations of policy dialogue on cultural heritage issues internationally for about four decades. By October 2011, 188 countries had signed the convention and are listed as participating states in the accord. Interestingly, the concept of nature conservancy and cultural heritage preservation remained linked in this policy forum.

In 1992, UNESCO established the World Heritage Centre, which serves as an action arm within UNESCO for the coordination of the *World Heritage Convention*. By organizing annual sessions of the World Heritage Committee, the Centre plays a lead role in setting significant policy issues related to heritage preservation across the globe. The Centre also maintains the World Heritage List, a compendium of cultural and natural properties that are considered the most outstanding heritage sites from an international perspective in need of preservation and protection. From a policy perspective, the World Heritage List performs a similar set of functions to that of the U.S. National Register of Historic Places. In 2011, there were 936 properties on the World Heritage List: 725 cultural properties, 183 natural properties, and 258 mixed natural properties in a total of 153 countries.

Subnationally, policies regarding cultural heritage are often products of state and local governments or nongovernment organizations concerned with heritage issues. For example, the *Heritage of Western Australia Act* 1990 (Government of Western Australia as amended 2009) establishes heritage conservation principles for the State of Western Australia. This Act served as the foundation for the creation of the Heritage Council of Western Australia that functions to establish and maintain the State Register of Heritage Places, ensure that any development of heritage places is in harmony with cultural values, and promote awareness and knowledge of cultural heritage. The 2011 *State Cultural Heritage Policy of Western Australia* builds upon the *Heritage Act* of 1990 and sets specific heritage policy objectives (Government of Western Australia, Heritage Council of Western Australia and the National Trust of Australia 2011).

Policies Guiding Program Action or Implementation

Once heritage policies are basically defined or established, additional policies often emerge that are designed to guide heritage program activities or the efforts to achieve more broadly defined heritage goals. For example, the U.S. National Park Service Management Policies describe procedures and protocols for the management of cultural resources on Park Service properties. These management practices relate to both preserving and fostering the appreciation of cultural resources.

On the international level, UNESCO and the World Heritage Centre issued its Operational

Guidelines for the Implementation of the *World Heritage Convention* (United Nations Educational, Scientific and Cultural Organization (UNESCO) 2008) which defines key processes of the Convention functions and documents implementation formats for signatory countries. Another international example is the *Charter for the Interpretation and Presentation of Cultural Heritage Sites* that was ratified in 2008 by the General Assembly of the International Council of Monuments and Sites (International Council on Monuments and Sites (ICOMOS) 2008). The Charter's stated purpose is "to define the basic principles of Interpretation and Presentation as essential components of heritage conservation efforts and as a means of enhancing public appreciation and understanding of cultural heritage sites" (International Council on Monuments and Sites (ICOMOS) 2008: 2).

Some policies relating to cultural heritage guide program operations of organizations not necessarily established to serve a specific cultural heritage purpose. The World Bank, for example, adopted policies (BP 4.11 and OP 4.11) in 2006 concerning the conservancy of "Physical Cultural Resources." These policies relate to the funding processes within the World Bank and are designed to "avoid or mitigate adverse impacts on physical cultural resources from development projects" that the World Bank finances (World Bank 2006a, b). As the policy title suggests, the definition of cultural resources is oriented to heritage that has physical form and the policy specifies that the assessment of risk to cultural resources is to be undertaken within a broader environmental assessment process for a proposed development project.

Key Issues/Current Debates

Public policies at the local, national, and international levels have made substantial progress in raising awareness about cultural heritage and promoting the principles of heritage preservation. A very common theme within the heritage policy arena is the linkage between issues of preservation or protection and those related to the economic potential of heritage sites. These potentially competing interests and how they are addressed or balanced are often the topic of the current dialogue on heritage policy.

Increasingly, cultural heritage policies are being woven within economic strategies and interests. Economic interests typically are driven or defined locally and within a country-specific context. Consequently, the policy issues associated with economic development and cultural heritage are increasingly being defined in terms consistent with the perspectives of national, district, or even city governments. As Western Australia's Minister for Heritage, G. M. Castrilli, states in his government's State Cultural Heritage Policy, "The protection and management of our heritage is also important to our social, environmental and economic prosperity" (Government of Western Australia, Heritage Council of Western Australia and the National Trust of Australia 2011).

Some have acknowledged the inseparability of heritage preservation and economic development. Yang and Phares, for example, outline protocols for including heritage management within poverty-reduction efforts, sustainable tourism, and job-creation interests at even the city level. Bono has emphasized the important role that countries and communities can play in identifying sites of heritage significance to indigenous cultures, while also recognizing the importance of linking cultural heritage interests with common interests in tourism, private enterprise, and job creation. Sullivan (2004: 54) identifies some of the advantages of empowering local communities to become involved in the cultural heritage management process and advocates addressing the economic and social interests of local communities to strengthen the policy environment for heritage preservation.

Managing heritage preservation objectives with economic growth interests also needs guidance. Acknowledging the importance of responsible site stewardship within an economic context, UNESCO's World Heritage Centre produced a manual for managing tourism at world heritage sites (Pederson 2002). In 2010, the U.S. State of Georgia's Historic Preservation Division of the

Department of Natural Resources and the Tourism Division of the Department of Economic Development produced a *Heritage Tourism Handbook* to "to assist communities in leveraging their historic assets to realize economic and cultural goals . . ." (Georgia Departments of Natural Resources and Economic Development 2010: 2). The Handbook provides the context for blending both heritage preservation and economic growth interests at the subnational level.

The effort to address various interests in the use of heritage sites can produce concerns over potential adverse impacts to heritage sites. ICOMOS (2011) recently issued guidance on how to assess the impact of development or other changes on World Heritage properties that both acknowledges that development can have negative effects on sites and offers concepts for mitigating impact. As such, the guidance provides an example of the effort to better manage potentially competing factors affecting heritage resources.

Another common theme within the public policy arena for heritage is resource allocation for cultural heritage work and the implementation of existing policies. While public awareness and willingness to do more in cultural heritage conservation and heritage management has grown, the financial resources available to fully implement existing heritage policies often limit what is possible. By 2002, for example, requests from countries to the World Heritage Centre for assistance with new World Heritage sites exceeded the resources available (Phares and Guttman 2002: 8–9). The interest among participating countries to receive financial assistance from UNESCO and the World Heritage Centre is regularly higher than annual funding levels. Similar situations of funding scarcity exist at national or subnational levels for cultural heritage work.

Recognizing the resource availability limitations, recent policy issues addressed in the international arena have included how to best expand the resources available to organizations active in cultural heritage. The World Heritage Centre held a conference in 2002 to help identify opportunities to develop new partnerships with civil society and corporations for cultural heritage efforts. Among the suggestions made were the development of public-private partnerships, and the "mainstreaming" of world heritage into the development processes of the World Bank and the United Nations (World Heritage Centre 2003: 144). Public-private partnerships often are relevant topics for local-level heritage preservation efforts or even in conservation efforts for a specific site.

International Perspectives

Internationally, initiatives are constantly evolving to build or maintain new systems of international cooperation for cultural heritage. Some (Barbosa 2003: 21) recommend new partnerships for heritage conservation that will involve "South-South" (developing country to developing country) cooperation and wider "North-south" (developed country to developing country) relationships that extend beyond traditional donor-recipient agreements as well as the involvement of corporations, research institutions, trust funds, foundations, and individuals in heritage conservation efforts. The fact that, in 2011, the World Bank hosted the 13th Annual International Symposium on the Economic Benefits and Challenges of Supporting Cultural Heritage for Sustainable Development illustrates that there are continuing ongoing gatherings in which new resources may be identified to help realize heritage policy goals.

One common issue within the policy arena affecting cultural heritage is that definitions of heritage change and evolve with time and location. Early cultural heritage policies focused largely upon tangible heritage and physical sites or items. Over time, definitions of cultural heritage have become more varied and more encompassing – incorporating oral or visual art forms, for example, and a variety of types of intangible heritage. Public policies, consequently, also must evolve with new policy expressions or be applied with flexibility to accommodate new concepts of heritage. As a result, public heritage policies are constantly being updated.

Once heritage policies are in place or adopted, organizations charged with implementing such policies often have insufficient internal capacities

to fully implement them. Heritage policies, therefore, frequently require capacity-building efforts (training, awareness-raising, adding staff, etc.) in order for policy principles to be realistically applied or undertaken. How best to build capacity for implementing heritage policies or realizing policy goals can be an important issue affecting the ultimate success of public policy.

Another issue that affects heritage policies is the complexity of stakeholder involvement in policy formulation as well as policy interpretation or implementation. The community of stakeholders for cultural heritage can be quite large and diverse. Stakeholders may be representatives of a particular cultural group, the residents of a specific location, local government officials, corporate executives, or senior national decision makers. The variety and wide range of disparate stakeholders can make effective involvement within the policy dialogue process challenging. Although new techniques for stakeholder involvement in heritage policy keep emerging, constant efforts for greater effectiveness in stakeholder participation are needed.

Future Directions

Within the public policy arena, new opportunities for cultural heritage dialogue appear destined to include more linkages between cultural preservation, job creation, and the economic benefits of cultural resource management. Policy advocacy, however, will need to be at international, national, subnational, and local levels in ways that also involve economic development interests and organizations.

At the country level, policies will be needed that clearly articulate a place for cultural heritage preservation within the economic growth strategies of national governments. These policies may require refining tourism policies and the role of cultural resource management in long-term plans for tourism over time. Significant opportunities exist at the national and subnational levels to rethink national policies related to cultural heritage management and longer-term national economic growth interests.

Within organizations or departments oriented to economic development or economic growth, new policies will be needed to ensure that initiatives succeed in conserving and protecting heritage and incorporate principles of prudent heritage management beyond just doing no harm to known cultural heritage sites. Development organizations will need help from cultural heritage experts to develop policies on financing heritage preservation efforts and also for creating an appropriate cultural resource management policy niche within economic growth or poverty-reduction priorities.

There are also opportunities for more active technical exchanges in cultural resource management where agencies with a historically domestic focus (such as the U.S. National Park Service or the Australian National Trust) can share proven cultural resource and asset management expertise within the wider global community. Countries which have a strong tradition of melding national cultural heritage management programs with a vibrant and important tourism industry (Italy, Egypt, or Tunisia, for example) also can provide valuable models for combined cultural heritage and economic growth strategies on a national scale that can be more effectively shared within the global community.

Another opportunity for public policy lies in the realm of measurement indicators for successful management of cultural heritage resources that can help governments and donor organizations know if growing investments in cultural heritage preservation are having the desired impact – both on heritage conservation and with respect to economic growth interests. New measurement indicators for heritage management will probably need to be developed and additional measurement techniques identified. Economists, archaeologists, other cultural heritage specialists, and a variety of other professionals will need to work together to formulate new multidisciplinary models for defining policy outcomes that link cultural heritage and economic growth goals.

Cultural Heritage and Future Public Policy

One of the most exciting aspects about cultural heritage in the future is that the policy environment will continue to change as new cultural

heritage conservation interests are expressed and heritage needs evolve at all levels. An ongoing challenge will be the broader involvement of stakeholders in the heritage policy process and the quest to link policy implementation with a broader array of available financial resources for the important work of cultural heritage preservation.

To realize the full potential of current and future heritage policy, there will need to be a vibrant and effective advocacy on the stage of public opinion for the importance of cultural heritage and the vital processes for responsible management of cultural resources. Advocacy for cultural heritage preservation within the economic development arena, where the financial resources at stake are substantial, remains incomplete. The development of new and evolved heritage policies will be required to take cultural heritage management to new levels and to attract the level of political and economic support that it deserves.

Advocacy champions for cultural heritage will still be needed within the policy context at all levels of government and civil society. These policy champions will have to be able to communicate convincingly with policymakers, using arguments that can link heritage conservation with economic goals and other programmatic imperatives of broad global concern. Policy champions may not be limited to cultural resource management professionals or to those who hold positions within the policy-formation arena of organizations already active in cultural heritage work.

There is also an important role for committed and informed laypersons with a cultural resource management perspective to play in future heritage policy development. They too can champion cultural heritage issues knowledgeably within the policy-formation process as communities become more involved in heritage management. Future advancements in public policy for cultural heritage issues will need to be based on an active and vibrant collaboration between cultural heritage professionals, managers of economic growth, communities, heritage organizations, and others. Therefore, the formulation of public policy for cultural heritage will continue to be a dynamic, multifaceted process.

Heritage and Society

John Schofield
Department of Archaeology, University of York, York, UK

Brief Definition of the Topic

Heritage has been traditionally defined as a thing, or more precisely as a collection of things, inherited from the past and given value by us, in the present. We value these "things" both for our own sake (e.g., to protect them and keep them around us as buildings, monuments, or artifacts) and for that of future generations. Heritage has also been defined as a set of processes (administrative and political, notably in the form of conventions and laws) by which we manage these things. And often, those processes go unchallenged or untested, at least by heritage practitioners. But heritage has recently come under critical review, leading some to identify it as exclusive and specialized under both of these interpretations, either because it is only "special things" which are given value (the rest being merely ordinary and everyday) or because "heritage management" is entirely in the hands of specialists and experts, who make decisions on behalf of society. Under this critical review (e.g., Smith 2006 and Council of Europe 2009), heritage now has a broader definition, one that recognizes the values attributed to things, not only by "the system" or "the establishment" and its facilitators but also by the many and diverse interest groups within society.

The 2005 *Council of Europe (Faro) Framework Convention on the Value of Cultural Heritage for Society* usefully defines heritage within the related contexts of democracy, multi-vocality, localism, and participation:

> Cultural heritage is a group of resources inherited from the past which people identify, independently of ownership, as a reflection and expression of their constantly evolving values, beliefs, knowledge and traditions. It includes all aspects of the environment resulting from the interaction between people and places through time.

Faro also recognizes the concept of a "heritage community," being:

> People who value specific aspects of cultural heritage which they wish, within the framework of public action, to sustain and transmit to future generations.

And of course "transmitting to future generations" does not necessarily mean preservation, and certainly not keeping things unchanged. In its current guise, at least in the developed world, "transmitting" and "sustaining" means passing things on in such a way that a link can be maintained to past human actions or events. Under this more socially aligned approach to heritage, the focus of attention would be less on a building that is preserved unchanged and more on retaining the character of a neighborhood or ensuring that a distinctive style or density of architecture is reflected in new development.

Heritage should not only be about decisions made by a group of specialists and the processes by which those decisions become recommendations, for statutory protection, for example. While these specialists and their processes remain significant, the "constantly evolving" values of the heritage community are paramount. Faro notes in its preamble how "*every person* has a right to engage with the cultural heritage of their choice," while being "convinced of the need to involve *everyone* in society in the ongoing process of defining and managing cultural heritage" (my emphases). Similarly, English Heritage's *Conservation Principles* (2008) include recognition of social value, defined as being:

> Associated with places that people perceive as a source of identity, distinctiveness, social interaction and coherence. Some may be comparatively modest, acquiring communal significance through the passage of time as a result of a collective memory of stories linked to them. . . . (Further) Social values tend to be less dependent on the survival of historic fabric. They may survive the replacement of the original physical structure, so long as its key social and cultural characteristics are maintained.

All of this represents progress and a move away from heritage as things to heritage as process and from heritage being divided between that which is tangible and intangible to an entirely intangible heritage. But it also takes us back to the fundamental questions that we ask of heritage: why does having a heritage benefit us, and can we recognize value in ordinary places, the everyday heritage around us? For heritage to be critically engaged, to have social value, and to retain currency requires it to have such a foundation. The authorized heritage discourse is one example of how this can work. As Smith has stated, heritage is not a thing or a site; heritage is what goes on at these sites, and the sites are ordinary, everyday places just as much as they are special and iconic. Heritage in other words is a broad church and, above all, a cultural process that "engages with acts of remembering that work to create ways to understand and engage with the present, and the sites themselves are cultural tools that can facilitate . . . this process" (Smith 2006: 44). Here we can summarize the argument to a point of simplicity: for those who recognize a heritage made up entirely of things, it can indeed be seen as a largely pragmatic atheoretical pursuit, more concerned with following procedures and protocols. But once all heritage becomes intangible, and concerned with the everyday, and with a diverse suite of cultural processes that change both locally and with time, things become far more complex, and for this a firm foundation (such as that outlined here) is required if heritage is to be central to creating a sustainable future.

Heritage Areas

Nancy I. M. Morgan
Point Heritage Development Consulting, Tallahassee, FL, USA

Heritage areas in the United States are large-scale living landscapes where residents and community leaders unite behind a common vision of shared heritage. Heritage areas strive to conserve natural and cultural resources while enhancing the vitality of communities within a region and managing change so that the region's sense of place is

retained. As such, a heritage area is not only a place, but it is also a management strategy by which local citizens work cooperatively to protect and enhance natural and cultural resources and living traditions resulting in economic, educational, and quality-of-life benefits for residents and visitors.

This United States' conceptualization of heritage areas aligns with specific categories for populated landscapes recognized by the International Council on Monuments and Sites (ICOMOS) and the World Conservation Union (IUCN). Both of these international organizations have established formal documentation schemes to describe and classify heritage. Both contribute to the definition of the World Heritage List through the United Nations Educational, Scientific, and Cultural Organization (UNESCO), with ICOMOS focusing on historic places and IUCN emphasizing natural heritage listings. Heritage areas fall under ICOMOS' Category 2 cultural landscapes, organically evolved landscapes that can be both relict (fossil) and continuing to evolve (UNESCO-ICOMOS 2011). Category 2 landscapes are living places reflecting the combined interaction of humans and nature and are mostly rural, primarily agricultural landscapes. Similarly, IUCN's Category V, protected landscapes and seascapes, recognizes the importance of places "where the interaction of people and nature over time has produced an area of distinct character" (IUCN 1994).

Under the conceptualization shaped by cultural resource management policy in the United States, a theme common to a specific region serves as the central element around which a heritage area is organized. The theme reflects the intangible heritage of a region, the shared history and cultural identity of the people who live there. The tangible heritage of the region – resources including archaeology, the extant built environment, living traditions, and the natural environment used by humans through time – is related to the primary theme of a region. In turn, this theme connects the individual resources to other resources, helping to define a cohesive cultural landscape with a shared history.

National Heritage Areas and National Heritage Corridors are designated by the United States Congress. They have evolved in conjunction with the National Park Service and share similarities with some national parks established in the latter half of the twentieth century, notably those whose boundaries include living populations. However, heritage areas are distinctive for the way in which they are managed from a local base of support. They expand on established resource stewardship models through their realization of large-scale, community-centered initiatives in which residents of the region, in partnership with the National Park Service, guide preservation and planning. As a partner and advisor, the National Park Service provides technical, planning, and limited financial assistance to National Heritage Areas, while decision-making authority remains in the hands of local people and organizations.

Each National Heritage Area has a coordinating entity that facilitates a broad network of partners who work collaboratively to preserve and interpret important resources and build a sustainable economy based on the heritage assets within a region. The coordinating entity oversees the development and implementation of a management plan to accomplish this. The coordinating entity also serves in an administrative capacity, including oversight of federal funding authorized by Congress through the National Park Service. The governance structures of coordinating entities vary widely, including nonprofit organizations, local and state governmental agencies, federal commissions, and universities. Although nonprofit organizations manage the majority of existing National Heritage Areas, the wide range of governance structures reflects the continued importance of identifying a coordinating entity that fits the individual circumstances of a region.

The first National Heritage Area, the Illinois and Michigan Canal National Heritage Corridor, was established in 1984. Since that time, the concept has experienced tremendous growth in popularity in the United States. In 2017, there are 49 congressionally designated National Heritage Areas, as well as numerous state and local programs. While resources, landscapes, themes, and management structures vary widely, the common element among all heritage areas is the strategy to

utilize a broad partnership network grounded at the local level for the protection and enhancement of cultural and natural resources related to a region's heritage.

Heritage as Resilience

Melathi Saldin
Alfred Deakin Institute for Citizenship and Globalisation, Deakin University, Burwood, VIC, Australia

Introduction

Resilience broadly deals with the diverse ways social or ecological systems change or adapt to challenging environments. Within the wider context of resilience, themes of cultural resilience in particular, illustrate the centrality of culture and heritage in the ways through which individuals or communities respond to diverse forms of adversity. Although resilience has been widely discussed and developed in disciplines such as the physical and environmental sciences, psychology, and international development, it has received little attention in the field of heritage and archaeology to date. Core issues such as the politicization of heritage and archaeology, for example, continue to give significant analytical remit to concepts of conflict, contestation and dissonance of heritage monuments, sites, landscapes, and cultural expressions (See for example: Kohl and Fawcett 1995; Tunbridge and Ashworth 1996; Logan and Reeves 2008). This situation calls for the conceptualization of a different metrics of heritage analysis, one which can help tease out those elements of the cultural heritage matrix which have garnered relatively little attention thus far. A framework of resilience can shed new light here and provide useful ways through which we may explore the dynamics of heritage in rapidly shifting local or global contexts, calling focus to the ways communities and their heritage-making practices change or adapt to political, economic, or environmental upheaval resulting from diverse forms of social and environmental change.

Definition

The term resilience comes from the Latin term *resiliere* [*re* (back) + *salire* (to leap)], meaning to leap back (Stevenson and Waite 2011). Resilience is defined by the American Psychological Association (2018) as "the process of adapting well in the face of adversity, trauma, tragedy, threats or even significant sources of stress." This process of adapting is complex and contingent upon a constellation of biological, psychological, social and cultural factors which shapes the way individuals or groups respond to challenging situations (Southwick et al. 2014). Other scholars such as Katrina Brown (2015) argue that resilience is not only the ability to positively respond to adversity but is also a means of capacity building in anticipation of change. Despite the diverse theoretical applications of resilience theory, its basic premise, which pivots on the ability to adapt in the face of adversity, has seen it acquire wide ranging applicability, including the increased understandings of the ways social systems respond to change. The underlying commonality for enabling resilience in

H

many of these definitions is the onset of significant risk or adversity, compelling change or adaptation amongst individuals or communities (Masten and Powell 2003, p. 4; Ungar 2008, p. 220).

Within wider theoretical framings of resilience, the concept of cultural resilience is crucial to the conceptualization of heritage resilience as it illustrates the centrality of culture and heritage to individuals and communities in response to diverse forms of adversity (Clauss-Ehlers 2010; Lalonde 2006; Hadler 2008). Caroline Clauss-Ehlers (2010, p. 324) argues that cultural resilience is enabled through the amalgamation of cultural background, cultural values, support systems, and other facilitating factors in the sociocultural environment which provides a dynamic and interactive process through which to negotiate adversity. How then does heritage resilience differ from cultural resilience? Although there are many underlying commonalities between cultural resilience and heritage resilience at both empirical and conceptual levels, I argue that heritage resilience needs to be viewed as distinct from cultural resilience. While cultural resilience focuses on the softer aspects of heritage such as cultural values, language, customs, and norms (Clauss-Ehlers 2010, p. 324), heritage resilience is more extensive as it also explores the impacts of harder forms of heritage, such as archaeological heritage, policy, and practice. Heritage resilience calls for a focus to the ways heritage is politicized, institutionalized, and operationalized [or even weaponized] within the context of local-global processes. Heritage resilience therefore can be defined as a constellation of heritage consciousness (embedded in either material forms of heritage or cultural expressions), shared sense of identity and community, contingent on a network or support system of individuals, groups, institutions, or social movements, which enable groups and communities to navigate and negotiate adversities by enabling identity affirmation, empowerment, and cultural survival. A framework of heritage resilience therefore can create useful pathways for understanding issues pertaining to identity and cultural diversity in nations dealing with complex or violent pasts, by compelling us to reconsider how communities negotiate and position themselves and their heritage within the complex local-global interplay of cultural politics.

Given the paucity of resilience as a framework of analysis in the field of heritage and archaeology, this entry on heritage resilience is informed by resilience perspectives from the spheres of social ecological systems and human development, notably the work of Michael Ungar (2008, 2012a) and Katrina Brown (2015). It particularly focuses on how heritage is mobilized in the face of challenges to the identity, belonging, and legitimacy of groups or communities resulting from diverse forms of social change. Ungar's definition of resilience is crucial here, as he notes that:

> Resilience is both the capacity of individuals [and communities] to *navigate* their way to the psychological, social, cultural and physical resources that build and sustain their wellbeing, and their individual and collective capacity to *negotiate* for these resources to be provided and experienced in culturally meaningful ways. (Ungar 2012b, p. 17)

How do communities mobilize heritage to navigate and negotiate adversity? This process of navigation and negotiation is underpinned by conceptualizing resilience as a "contextually and culturally embedded construct" (Ungar 2012a, p. 3). Thus, while there are universally common elements of resilience observable across communities navigating and negotiating change, it is also important to be cognizant of culturally and contextually embedded elements which may enable resilience in some communities but not necessarily in others. Other scholars such as Katrina Brown (2015, p. 203) argue that there are three key elements which enable resilience in the context of adversity. These are:

1. Resistance
2. Rootedness
3. Resourcefulness

How then can we conceptualize cultural heritage as a means of enabling resistance, rootedness, and resourcefulness of groups and communities in the face of adversity? Firstly, recognizing resistance as a key element of resilience helps focus on notions of agency (Brown 2015, p. 214). In the sphere of heritage, for example, resistance is key

to the establishment of alternative heritage narratives, which can be seen as a strategy for navigating and negotiating the constraints of the dominant or authorized heritage discourse. Elements of resistance/resilience can also be seen in the actions of heritage activists who reorient state or other hegemonic heritage discourses to further their own personal or communal symbolic capital. Notions of capital as a correlate of resilience are important here as it provides a means through which to evaluate resilience in communities dealing with change. Moreover, a capital approach also helps to chart resilience trajectories, a key element of predicting and managing future change (Mayunga 2007). Secondly, Brown's notion of the "rootedness" of resilience allows for greater emphasis on the lived realties of communities, calling focus to the ways they construct place, identity, and belonging and their role in facilitating resilience as a means of adapting to adverse situations (Brown 2015, p. 203). This approach also allows for better understandings of the deeper histories of resilience, departing from binary notions of resilience to conceptualizing it as existing on a continuum, observable in varying degrees across diverse groups and communities (Southwick et al. 2014, p. 2). Understanding the spatial and temporal aspects of resilience are crucial to situating resilience as a long-term process, constantly negotiated and renegotiated within the complex realm of local-global dynamics. Thirdly, Brown's identification of resilience as a form of resourcefulness deals with the adaptive capacity of communities including their aptitude for innovation, social learning and tenacity for accruing social and political capital (Brown 2015, p. 216). These understandings are crucial not only for developing resilience among affected groups and communities but also for ensuring its sustainability in the event of future challenges.

Historical Background

Resilience as a theoretical concept has its beginnings in the nineteenth century in the field of materials science and was used to assess the ability of materials to withstand extreme conditions (McAslan 2010, pp. 1–2). It also features prominently in the sphere of environment and ecology, focusing on the ways through which ecological systems return to a state of equilibrium following a disturbance or disaster (McAslan 2010, p. 3). Resilience theory gained traction in psychological sciences in the 1980s, with pioneering studies on resilience building among children and youth by scholars such as Norman Garmezy (1985). By the mid-2000s, the concept of resilience emerged as a popular frame of analysis in the field of international development, particularly following the events of the global financial crisis of 2007–2008 (Brown 2015).

Resilience theory presents significant potential as a framework of analysis for the field of heritage and archaeology. This is especially significant given the deficit discourse framing much of the contemporary debates on heritage and archaeology, which erases or obscures other equally important narratives on resilience emerging despite adversities such as urbanization, environmental catastrophe, or armed conflict. Minority, indigenous, and other historically, socially, or economically disadvantaged communities and their heritage are particularly susceptible to this erasure. As a consequence, these communities are portrayed as homogenous and often passive players within state or other hegemonic processes, further embedding notions of their exclusion, marginality, and victimhood (Kuutma 2012, p. 45).

Linda Tuhiwai Smith's (1999) seminal work on *Decolonising Methodologies* for example demonstrates how notions of victimhood and trauma are replicated in the literature on indigenous communities, even those produced by subaltern scholars who claim to write against established Western modes of knowledge. She argues that the uncritical use of colonial accounts of indigenous people, together with the embedded colonial/Eurocentric ways of reading, writing, and learning about them have resulted in the self-imposed *othering* and the perpetuation of colonial myths about native cultures. She notes, "we begin to write about ourselves as indigenous peoples as if we really were 'out there', the 'Other', with all the baggage this entails" (Smith 1999, p. 36).

Similarly, Dominick LaCapra's (2001, pp. x–xi) *Writing history, Writing trauma,* dealing with the depiction of the Holocaust, argues that trauma has become a scholarly preoccupation and is particularly evident in the literature dealing with major historical events. This has resulted in the needless conflation of culture or history with trauma, leading to notions that contemporary culture and history are fundamentally traumatic, even in spite of the existence of processes which counter or mitigate trauma (LaCapra 2001, p. x).

The victim discourse in heritage literature, in particular, have been critiqued by many scholars, particularly those working in the indigenous heritage space. Scholars such as Sonya Atalay, Audra Simpson, Kristin Kuutma, and others argue that much of the dominant heritage discourse establishes and constrains indigenous and minority communities into themes of marginality and victimhood, often overlooking their potential agency (Simpson 2007; Atalay 2006; Kuutma 2012). They are among a growing number of scholars who advocate for the recognition of resilience, empowerment, and resistance in the debates on indigenous and other communities, who are typically labelled as vulnerable or marginal within the dominant discourse. Audra Simpson's (2007) account of the Mohawks of Kahnawake, for instance, exemplifies the dramatic inconsistencies which exist between the community's anthropological representations and their lived realities. Simpson's work elaborates the myriad ways through which the Mohawk community transcends dominant discourses of marginalization imposed upon them to effectively garner sociopolitical and cultural recognition within wider American society (Simpson 2007, p. 68). Similarly Kristin Kuutma's (2012) work on Estonia's indigenous Seto community and the inscription of their *Leelo* choral tradition to the UNESCO Intangible Cultural Heritage (ICH) List demonstrate their achievement of agency despite frequent academic representations of them as powerless within state processes. Kuutma argues that rather than being "passive recipients" of authoritarian processes, the Seto community redeployed discourses of heritage and nationalism to further their sociopolitical recognition and also acquire personal as well as communal symbolic capital within the backdrop of the UNESCO ICH inscription process (Kuutma 2012, p. 45).

In their thought-provoking edited work, *Theory and practice in heritage and sustainability: between past and future,* Elizabeth Auclaire and Graham Fairclough (2015, p. 3) argue that "heritage is the central thread of sustainability, not only as an issue of preservation but of creation, adaptation and resilience to change." For example, heritage enables community resilience through its contribution to everyday life, identity formation, and relationship building (Auclair and Fairclough 2015, p. 3). The role of heritage in resilience building is particularly amplified in the event of political instability or armed conflict, especially those which challenge the identities, belonging, and legitimacies of minority groups or communities. Cultural heritage also plays a crucial role in post-disaster or post-conflict resilience building and is crucial to the formulation of disaster risk reduction strategies (Hosagrahar 2017; Jigyasu et al. 2013). Traditional knowledge, for example, especially that embedded in traditional lifestyles, customs, and livelihoods can provide strategies for communities to better equip themselves against natural disasters, especially those inhabiting areas prone to such phenomena (Jigyasu et al. 2013, p. 21; Hosagrahar 2017). More importantly, heritage provides a much-needed source of psychosocial support, by reinforcing a sense of identity, belonging, and self-esteem for communities in the aftermath of disaster or conflict, ensuring a more rapid and sustainable recovery (Jigyasu et al. 2013, p. 22). Despite these welcome shifts in academic thought, much still remains to be done in foregrounding themes of resilience in heritage and archaeology scholarship.

Key Issues/Current Debates

There are a number of contentions with the adoption of resilience as a theoretical concept. Firstly, its lacks of a concrete definition has led to

questions on the robustness of its application in particular contexts (McAslan 2010, p. 1). Secondly, some scholars suggest that the identification of resilience in communities may have more sinister implications, wherein the achievement of wellbeing may be seen as the "personal responsibility" of communities, thus absolving institutions, governments, and global systems of authority who are responsible for safeguarding the world's most vulnerable groups (Thrupkaew et al. 2010). Despite such contentions, scholars such as C.S. 'Buzz' Holling (2006), widely considered to be the father of resilience theory, has a more positive outlook on the concept of resilience. He contends that a framework of resilience provides a useful and innovative lens through which we may understand the ways individuals, communities, organizations, and ecosystems cope with our rapidly changing world. Notions of resilience can help us to better comprehend how communities could or should respond to diverse forms of upheaval and also help formulate contingencies in anticipation of future adversities (Holling 2006).

The third critique is that the concept of resilience under-theorizes issues of power and social relations (Hornborg 2009; Fabinyi et al. 2014). However, approaching resilience as a "contextually and culturally embedded construct" (Ungar 2012a, p. 3) and focusing on the way resilience is "lived and experienced" (Brown 2015, p. 115) through its myriad forms of resistance well as resourcefulness is perhaps crucial in overcoming this theoretical obstacle. Despite these issues, the consensus among scholars appears to be that a framework of resilience can help steer debates based on a purely deficit discourse to those which pivot on themes of wellbeing, empowerment, and capacity building of communities affected by adversity (Southwick et al. 2014; Ungar 2008; Brown 2015). In the sphere of cultural heritage, a focus on resilience is useful to recast "vulnerable" or "marginal" communities and heritage by recognizing potential agency, thus reorienting perceptions of such communities as passive players within state or other hegemonic systems. Thus, resilience provides a useful framework to analyze power relations between the various stakeholders of heritage, which have been conventionally conceptualized as a top-down process. The key challenge in utilizing resilience as a conceptual framework, however, lies in clearly defining its perimeters of analysis, including the elements and composition of what constitutes resilience in the communities or other contexts in question.

International Perspectives and Future Directions

Framed within the context of heritage, what meanings does resilience take on in nations which have been in a constant state of upheaval owing to processes such as colonization, decolonization, civil war, or natural disasters? What are the deeper social, political, or economic histories of communities which demonstrate resilience? How does resilience speak to themes of empowerment, cultural survival, and identity affirmation in disadvantaged communities or in the mediation of social relations in culturally diverse societies? Moreover, what are the different social, cultural, and structural forces which afford opportunities or resources to communities in times of adversity and how are these utilized?

In post-war Sri Lanka, for example, adversity also stems from the implications of post-war cultural politics on minority communities, notably when archaeological knowledge and practice are also used to challenge their identity, belonging, and legitimacy. The civil war which spanned nearly three decades was mainly a result of the struggle for a separatist Tamil homeland – *Eelam* – and was waged between the Liberation Tigers of Tamil Eelam (LTTE) and the Sri Lankan Government forces. As with ethnic conflicts elsewhere, in Sri Lanka, history and heritage played an important role in the questioning of belonging and legitimacy of non-Sinhalese minorities, wherein rhetorical wars over archaeological sites and place names paralleled the civil war (Spencer 1990). With the end of the armed struggle in 2009, conflict in Sri Lanka has taken on a new form,

with increasing incidents of post-war violence targeting another ethnoreligious minority, the Muslims. Historical and material continuity (or the lack thereof) have come into play once more and are co-opted in the rhetoric which questions Muslim identity, legitimacy, and belonging to the Sri Lankan state. The "lack" of visible, particularly monumental forms of Muslim heritage, in comparison to the majority Sinhalese community, as well as other minorities such as the Tamils, has often been used as leverage by those contesting their identity and belonging within the Sri Lankan state.

As a consequence of these sociopolitical developments, much of the dominant discourse on post-war Sri Lanka is replete with themes of conflict and contestation. This also includes a growing scholarly and popular discourse around threats to the wellbeing of the Muslim community, particularly in relation to the contestation and conflict of heritage sites and landscapes between Sinhalese and Muslim communities (See for example: Secretariat for Muslims 2015a, b). The rise in anti-Muslim rhetoric as well as the strategic politics of victimhood adopted by sections of the Muslim community has increasingly posited Muslims as "victims" of the civil war and the continued ethnic tensions in its aftermath. However, less obvious are the diverse ways through which the Muslim community mobilize heritage as a means of resilience to engender belonging, identity affirmation, or ensure cultural survival. Equally obscure are the ways they garner personal or communal forms of social, political, or economic capital in the face of adversity.

The rise of Islamic fundamentalism in the West and regional developments such as the ethnic cleansing of Myanmar's Rohingya Muslims, simmering Hindu-Muslim tensions in neighboring India, as well as the increasing spectre of ISIS (Islamic State in Iraq and Syria) in Asia has increasingly posited Muslims as nonintegrative or politically dissident minorities. These shifts have increasingly paved the way for questioning of Muslim identity, belonging, and legitimacy in Sri Lanka, often with violent consequences. Challenges to the identity, belonging, and legitimacy of Muslims in Sri Lanka have garnered diverse responses; clear among them, however, is the turn to history and heritage. This is evident not only in the construction of Sri Lanka's first Muslim heritage museum in 2015 but also in the increasing trend of other heritage- and culture-related activities promoted by Muslim grassroots and civil society movements. Everyday forms of heritage, particularly those pivoting on religious belief and cultural practice are important aspects of resilience building. These not only help to engender feelings of belonging and identity affirmation among the Muslim community but also plays a crucial role in enhancing dialog and understanding with other communities. Muslim civil society initiatives such as the Welcome to Our Mosque program and the Islamic Poster Exhibition series initiated by the Centre for Islamic Studies (Colombo) are an example of how civil society and grass roots movements can help the Muslim community positively respond to post-war cultural politics. The Welcome to Our Mosque program encourages those of different cultural or religious backgrounds to gain an immersive experience of Sri Lankan Muslim heritage by opening up the mosque – a core location of Muslim religious and community activity. This development is critical given that mosques in Sri Lanka have been particularly reticent to the idea of opening up that space for non-Muslims and to a certain extent also to women [Muslim or otherwise]. Although a deceptively simple approach, I would argue that this initiative has the potential to positively impact majority-minority relations as it provides a window into spaces and practices which hitherto had been confined to the Muslim community.

The ability to engender or cultivate resilience in the face of challenges to belonging and identity largely stem from the deep social, cultural, and structural forces developed by the community. Indeed, as anthropologist Dennis McGilvray notes, Muslims are seen as "shrewd, hardworking and successful" by other communities and have ensured their physical and cultural survival through the construction of distinct cultural styles, ethnic identities, and political tactics over the past

four centuries (McGilvray 1998, pp. 468, 473). This is further reflected in the Muslim community's position of a "good minority" within the context of the civil war. A rationale largely stemming from their support of the Sri Lankan government through intelligence gathering on behalf of the Sri Lankan armed forces, accommodative politics of Muslim political parties, as well as their proxying for support of Muslim nations on behalf of the State (DeVotta 2016, 2017). The crucial challenge for Muslims minorities in Sri Lanka (and elsewhere) in the present volatile and uncertain context therefore would be the formulation of strategies which ensures long-term resilience, empowerment, and wellbeing. For Muslims in Sri Lanka and increasingly other parts of the world, where they are part of national or migrant minorities, this would largely rest on their ability to build dialog with other groups and successfully position themselves as part of the whole. Indeed, as McGilvray (2016, p. 21) argues this would also require greater emphasis on their cultural rootedness to the land, rather than an emphasis on foreign forefathers or a connection to "[radical] global Islam." Culture and heritage are key to this process and present powerful means through which to cultivate this sense of rootedness and engender resilience among minority groups, encouraging identity affirmation, legitimacy, and belonging to their respective states.

Heritage Conservation Training

Vanessa de Castro Dutra
Rome, Italy

Introduction and Definitions

All archaeological materials come from materials present in nature, which are shaped and transformed through complex processes into what we call cultural heritage. After we uncover them and disrupt the steady condition which they had reached with its surroundings, every new environment or product that we introduce into the ancient material will cause a new reaction (Fig. 1).

Heritage is a very broad concept and the training involved will depend on the desired field of work.

In brief, heritage is firstly divided into natural heritage and cultural heritage. The latter is subdivided by intangible cultural heritage (e.g., music, rituals) and tangible cultural heritage (material things), which is divided into movable (e.g., paintings, ceramics) and immovable (e.g., monuments, archaeological sites).

Heritage Conservation Training, Fig. 1 Archaeological conservator-restorer meticulously stabilizing and restoring a mural painting to its original aesthetics and applying protection for its future conservation. Hence the difference between the decayed left area with later added layers of paint and the treated area on the right

This section deals solely with the conservation training for tangible cultural heritage, movable and immovable, with special attention to archaeological heritage, and with what is sometimes regarded as a third subdivision, which is underwater cultural heritage.

Education and Training Specializations

Heritage conservation training can be done by firstly studying all materials (cultural heritage conservation courses) and then later seeking further training to become a specialist in one or by choosing a specialization from the start. From one country to another, these specializations are separated in different ways. Even in the same country, specializations may be separated differently from one institution to another. It is usually separated either by material specialization, paper, stone, wood, glass, ceramics, textiles, etc., or by subjects, all kinds of painting (e.g., on canvas, wood, metal), graphic work (e.g., papyri, parchment, paper), sculpture (e.g., wood, metal, stone), etc. (Fig. 2).

One of the specializations by subject is archaeological conservation. It deals with all materials that can be found at archaeological sites (e.g., rock art, mural painting, mosaics, stone, glass, wood, papyri, parchment, bone, leather, metal, textiles, ceramics). Whether in the desert, forest, or underwater, an archaeological conservator must be ready and able to assure the protection and conservation of archaeological heritage at all its chemical, physical, and biological levels.

Heritage Conservation Training, Fig. 2 Conservator-restorers specialized in painting are trained to treat all painted surfaces, such as wood, leather, fabrics, stone, metal, etc., and with all sorts of materials applied to them, such as all different pigments, mediums, preparation materials, and gold

Archaeological conservation in excavations must start with planning, and it continues during the uncovering of materials with specific conservation methods for extractions and cleaning (which is when materials are most fragile) and other treatments in situ until packaging and final transport (Fig. 3).

Archaeological conservation then continues in future lab treatments and restorations, in storage

Heritage Conservation Training, Fig. 3 Training includes a lot of planning, organization, and documentation skills. Conservator-restorers with archaeological heritage specialization have their own independent procedures but will work side by side in interdisciplinary teams, especially during excavations

and exhibition parameters and monitoring work, and with archaeological site's conservation plans. In brief, from the moment an archaeological material is exposed, inevitable reactions already start during contact with the open-air atmosphere, and so, from this moment on, conservation is a responsibility and the highest priority. This is essential to secure these materials for professional research of future generations, not just for archaeologists and not just for those who discovered them.

Although there are courses that do include heritage conservation as part of the curricula, they are very different from the courses which are specific for those who want to pursue the conservator-restorer profession. For example, higher education in archaeology, museology, and cultural heritage management will address the conservation issue because the objects and sites are also the focus of their study and practice, but objects and site conservation are not their main issue.

While these courses sometimes include knowledge in conservation, it is very basic and mainly focused on promoting an overall preservation of objects and sites. These professionals will then work together with a conservator-restorer to take decisions on anything that regards to maintaining the objects and sites in a chemically, physically, and biologically stable condition for future generations, applying methods for arresting deterioration as much as possible, and rescuing the aesthetics and specific ancient technological information from objects and materials in situ (Figs. 4 and 5).

Different continents differ in requirements for training, but there is a global tendency to adopt the requirements specified by the European Confederation of Conservator-Restorers' Organisations – ECCO. Therefore, to be accredited as a conservator-restorer, one must achieve master's level (ENCoRE 2001). To start, one can have a degree either from a recognized heritage conservation school (usually under the auspices of the country's ministry of culture) or a university BA in conservation and restoration in accordance to ECCO's Professional Guidelines (ECCO 2004).

Heritage conservation schools are different depending on the country, with studies lasting 3–5 years. Access depends on entry examinations to compete for limited placements. These schools will sometimes dedicate all years to conservation of all materials, but some will start with a common training to all and then divide students into their desired specializations from the 2nd or 3rd year onward (see table below for an example of a heritage school curricula for specialization in Conservation and Restoration of Archaeological Heritage).

Heritage Conservation Training, Fig. 4 Experts in archaeological conservation-restoration train recent graduates for complex procedures, such as treatments in situ and the extraction of mosaics when necessary

Heritage Conservation Training, Fig. 5 Mosaic being prepared for extraction and transport to a museum

In universities, BAs usually mix contemporary fine arts studies with conservation of materials in general, and the degree obtained is in conservation and restoration of cultural heritage. There are also many master's degrees in universities that will focus on certain aspects of conservation, like new technologies for museum environments or only for scientific lab analysis work in conservation. Students who seek these masters may come from different backgrounds, like museology and chemistry, but those who already have a degree in heritage schools or a university BA in conservation also seek these masters to enhance their training (Fig. 6).

Although some of the BA level courses have existed for many decades, master's degrees are a recent requirement for work in this field, and many conservators now also pursue a PhD. Although these are today's requirements, many great conservator-restorers used to acquire their knowledge and skills as they were passed down through direct high-level apprenticeships in museums. Apprenticeship is still the strong part of training in heritage schools and universities; knowledge of theory and practice on original materials are passed onto students with the guidance of other conservator-restorers, the teachers.

Heritage Conservation Training, Fig. 6 Conservator-restorers will often transport to the lab objects that are extremely fragile as a whole block, surrounded by the materials as they were found at the excavation. The excavation will then proceed meticulously first with its stabilization and consolidation to, only then, remove earth and sand. In underwater environments, objects are kept in the original water from the site and are brought to atmosphere conditions through very long and complex procedures

Training in conservation and restoration of cultural heritage doesn't stop after attaining a degree, and internships and fellowships are important. These are later essential to those who come from another field of study and have only done a 2-year masters in conservation.

Recently graduated conservator-restorers will earn experience as interns or fellows in museums and, if doing an archaeological conservation specialization, also at archaeological sites assisting senior conservator-restorers. There are also many short courses offered by private schools and by heritage institutions, such as ICCROM, which are very useful for conservation and restoration professionals to expand and update their knowledge. These short courses are also sought by professionals from different areas who have a specific work demand, like architects who deal with ancient building materials or archaeologists who want to take part in packaging and transportation responsibly.

Many archaeological conservator-restorers specialize even further, becoming a specialist in metal or ceramic, for instance. Others may specialize on materials from one culture, like Greek and Roman, or from a specific environment, like underwater heritage. Material or culture specializations mainly occur in museums, where work areas are separated. This happens less with those who choose to work only with excavations since finds are a surprise and one must be ready to treat different materials.

Conservator-restorers are expected to always continue scientific research, attend international conferences and seminars, be updated with the latest technologies, and contribute to the conservation-restoration field of knowledge by publishing and giving lectures about their research and experiences (Fig. 7).

Observations About Archaeological Conservation

Archaeological conservation is separated from other specializations because all archaeological materials have been in environments with many elements other than those present in the air and they have been that way for very long periods of time. An archaeological wood, for instance, may have been underwater for centuries.

Thus, in this case, an archaeological conservator must understand the properties of both the wood and of the underwater environment in which it is in to better understand the interactions and alterations that happened on this and on other materials found at the site. Each of these environments interacts differently on materials and leaves

HERITAGE SCHOOL SPECIALISATION CURRICULA:
ARCHAEOLOGICAL CONSERVATION AND RESTORATION

Practical training in conservation-restoration laboratories:
- Technical and Methodological Conservation and Restoration 1st and 2nd Year
- Artistic Techniques and Procedures Applied to Conservation and Restoration 2nd Year
- Conservation and Restoration of Archaeological Heritage: Stone, Ceramics and Glass 3rd Year
- Conservation and Restoration of Archaeological Heritage: Metals 4th Year
- Conservation and Restoration of Ancient Pavements and Mural Coatings 3rd Year
- Conservation and Restoration of Organic and Paleontological Heritage 4th Year

Classroom:
- Archaeological and Paleontological Excavation Techniques 3rd Year
- Archaeology: Methods and Techniques of Heritage Production: Prehistory and First Civilisations 3rd Year
- Archaeology: Methods and Techniques of Heritage Production: Classical Period Onwards 4th Year
- Archaeological Heritage Techniques Applied to Conservation and Restoration 3rd Year
- Scientific Research Methodologies 4th Year

Drawing studio:
- Drawing: Artistic and Technical 1st Year
- Archaeological Drawing 3rd Year

Laboratories:
- Chemistry and Physics Applied to Conservation and Restoration 1st Year and 2nd Year
- Biology Applied to Conservation and Restoration 2nd Year
- Chemical and Physical Methods: Examination, Analysis and Dating 3rd Year
- Biological deterioration: Analysis and Control 3rd Year

Classroom:
- Material Properties and Technologies 1st Year
- Preventive Conservation: Display, Storage and Transport 2nd Year
- Iconography and Iconology 2nd Year
- Museology 3rd Year

Special Studios:
- Color Theory Applied to Conservation and Restoration 1st Year
- Photography 1st Year
- Photography Applied to Conservation and Restoration 2nd Year
- Casts and Reproductions 2nd Year
- Casts and Reproductions Applied to Conservation and Restoration 3rd Year
- Computer Science Applied to Conservation and Restoration 1st Year

Classroom:
- Documentation Techniques 2nd Year
- Cataloguing, Expertise and Assessment 4th Year
- Cultural Heritage Legislation 4th Year
- Management and Professional organisation 4th Year
- Graduation Project 4th Year

Heritage Conservation Training, Fig. 7 Free translation of 4-year archaeological heritage specialization from the school curricula of The Upper School for Conservation and Restoration of Heritage in Madrid, Spain. To see other accredited institutions with specialization in archaeological conservation and other specializations, refer to the European Network for Conservation-Restoration Education

Heritage Conservation Training, Fig. 8 Conservation uses the latest technologies, like in this example of cleaning with laser a fragment of Pompeian mural painting

a permanent mark on their chemical, physical, and biological properties, thus needing very specific treatments and ongoing conservation measures.

So besides the specific properties of each archaeological material, archaeological conservation also studies the properties of the environments, such as chemical properties of water (in marine environment, lakes, bogs, atmospheric humidity) and different sediments; physical properties, such as the effects of currents and pressure on archaeological materials; and biological activity, from underwater to desert environment.

These environments are important to understand because they give more information about the possible damage and alterations of the materials at microscopic level, which is crucial to determining future conservation methods and treatments to secure material integrity from the excavation moment when it is uncovered, to the subsequent phases of treatments, transportation, storage, and exhibition (Fig. 8).

Key Issues and Examples

Basic Concepts of Conservation and Restoration

Training in conservation and restoration reflects the different needs and demands in museums, archaeological sites, and working with heritage in general. Thus, the training choices must meet the desired work practice. One may have a BA in chemistry and do a masters in preventive conservation, which would lead to working in a museum as a consultant for object display, storage, and transport, for example. In contrast, with a BA in chemistry and a masters that focuses in applied technologies, one may work at museum laboratories to assist conservators on the analysis of materials.

In this case, although being at conservation masters level, it will not be possible to work as a restorer. Restoration requires high manual dexterity, expertise in material properties, and perfect use of color pigment materials, besides a lot of practice on original objects during the training period (Fig. 9).

To understand better the terminology while searching for conservation-restoration training, it is useful to know a few basic examples:

Preventive Conservation: indirect actions to preserve heritage, it deals specially with its environment. Examples of these are in management policies and management plans, such as limiting tourist access to certain areas, risk assessment and emergency plans at heritage sites, as well as heritage registration and documentation. Other examples are adapting lighting, temperature, and humidity to the objects' surroundings to prevent deterioration and guarantying specially adapted materials and conditions for display, storage, and transport.

Heritage Conservation Training, Fig. 9 Conservation and restoration are done at microscopic level, like on this ancient coin during mechanical cleaning with the tip of a scalpel

Conservation: direct actions to maintain the integrity and authenticity of objects and sites. They are actions taken only by conservator-restorers because they are direct interventions on the original materials. The interventions usually involve applying and removing substances and adding new materials to the original.

Conservation principles require, among other things, that all new materials applied be used only when strictly necessary, in minimal quantities and with properties that make it reversible and don't jeopardize the conservation of the original's properties. For that to be possible, a huge amount of research is done in conservation science.

Examples of conservation work are cleaning and applying protective coatings and deeper structural consolidations, such as filling in cracks between loosen parts or stabilizing mural paintings. The goal is solely to guarantee the object's "health" by stabilizing its structure and material properties to arrest deterioration. Work also involves rescuing heritage from places where they will be destroyed, such as removing and transporting mosaics from construction sites or because of natural disasters.

Restoration: direct actions on already damaged materials. The aim is to make it possible for the original to be understood in the way it was originally meant to be and recover part of its aesthetics as so not to disturb the overall appreciation of the object or site.

Restoration is done only up to the point of reaching these goals. They are kept to absolute minimal interventions that secure the object's integrity and with respect for the original's authenticity by differentiating it from the new intervention, a distinction that should be able to be seen from up close.

An example of restoration is when ceramic fragments, already conserved, are put together to regain its original shape. Another example is broken fingers of sculptures. As long as there is sufficient evidence of how the missing part was originally, another can be made accordingly so that the missing part will not disturb the aesthetic appreciation of the sculpture. Restoration is not necessary for the "health" of materials, but when it is done, interventions are always carried out under conservation principles.

One important difference between conservation and restoration is that conservation is not an option; it must always be done and it is done by constant ongoing procedures, even for materials that are in storage; and restoration is an option, also a decision that can be made later in time, depending usually if the heritage in question will be displayed to the public (Fig. 10).

Heritage Conservation Training, Fig. 10 As it can be seen on this image, stabilization and consolidation of mural paintings is a delicate process, usually done with syringes and always with tested chemicals that are compatible with the original

After Training

An archaeological conservator will live in interdisciplinary atmospheres, but mainly in the scientific fields of conservation and archaeology. Like during the 2 years of archaeology studies during conservation training, one must continue studying ancient cultures' technologies and materials and art history, as well as being up-to-date with new technologies being applied in archaeology to be able to work in interdisciplinary cooperation with professionals in situ and in museums.

In the conservation and restoration field, one must be completely up-to-date with what are the conservator-restorer's practices: latest researches about new conservation and restoration technologies; ongoing studies about new chemicals, materials, and methods being applied; conservation and management issues in archaeological sites and museums; conservation awareness projects; and what is being written by its scientific community. The main resource for this is *Studies in Conservation*, published by IIC (International Institute for Conservation of Historic and Artistic Works) with a range of heritage conservation topics and their latest developments in the international community.

As conservation procedures by professionals are necessary on-site, the relationship between archaeologists and conservator-restorers is very close in many countries, not only during excavations and for site conservation planning but also later. This relationship continues because they study archaeological materials from different perspectives, which is something that enriches research for both fields.

It is very common for conservators to discover further information on archaeological materials during conservation and restoration in museums and sites long after the excavation has ended, sometimes decades later. Examples of these are discovering parts of objects that were added to them in later years while still in usage. Not being part of the objects' first conception, these informations shed light on how the objects were used and thought of.

Other common examples during conservation work are revealing hidden ancient layers of painting, graffiti in mural decorations, discovering internal characteristics of materials that lead to ancient manufacturing techniques, and retrieving, many years later, color pigments in the materials' pores that hadn't been noticed before, thus revealing the true colors of something to know how it once was originally (Fig. 11).

Conclusion

As mentioned before, training in conservation is different from one country to another and so is the minimum training required to earn professional recognition as a conservator-restorer. Improper interventions without expertise are disastrous, even if microscopic reactions take years to reveal

Heritage Conservation Training, Fig. 11 After training, it is common for archaeological conservator-restorers to also work with medieval and baroque heritage that are not archaeological materials. This is because work involves conservation and restoration of materials that were studied during archaeological conservation training, like stone, wood, metal, mural paintings, stained glass, etc.

its consequences. Therefore, a masters level education with a lot of practical work is required in most countries, and paths to the desired work in the archaeological conservation field will depend on the training choices that are made.

Furthermore, conservator-restorers in archaeology can later specialize even more within archaeological conservation, as there are a multitude of environments and materials to work with. International institutions are a great source of information about conservation specializations and training opportunities. To know more about professional guidelines and conservation training, it is advised to search for the country's conservator-restorer association, as well as heritage conservation institutions and universities.

Heritage Ethics, Cultural Base of

Karen D. Vitelli
Dresden, ME, USA

Introduction

Most would agree that every profession has its own culture: a set of shared beliefs, values, customs, and appropriate behaviors that are passed on from one generation to the next. We recognize this culture in the friendly stereotypes derived from them: the archaeologist in safari gear, trowel in one hand, beer in the other; the art historian with CDs full of adjectives and a glass of chablis; politicians kissing babies and shaking hands; and so on. Aside from stereotypes, a professional culture includes a shared sense of the responsibilities and standards that guide members in the practice of their profession, that is, their professional ethics. These professional ethics are often implicit, passed on from mentor to student by example in the course of general training.

In the early years of most heritage-related disciplines, when the world felt simpler, fewer views were actively voiced and considered and most members of a profession knew each other (McGimsey 2002), this process worked reasonably well. Today, when the professions are themselves fragmented into subgroups and specialties, all interacting more frequently with the world outside the profession, implicitly conveyed ethics and standards seem insufficient. Thus, professional standards are increasingly being made explicit (O'Keefe 1998: 33), codified by professional organizations, and tailored to the specific goals and values of each organization; in a sense, their code of ethics grows out of their professional culture.

Key Issues/Current Debates/Future Directions/Examples

Professional organizations generally undertake the hard work of producing or revising a statement on ethics when the profession feels poorly represented by the actions of some or when serious issues with an ethical dimension shake the organization (McGimsey 2002; Davis 2003). Those drafting a new code basically begin with lists and discussions of perceived problems. These may include issues shared across professions but most are specific to one profession, even to one organization within that profession.

For example, in the early years of their discipline, archaeologists often worked closely with, or were themselves, collectors of antiquities (e.g., Butcher & Gill 1993). The archaeology of the day saw benefit, or at least no harm, in the practice.

Major developments in archaeological practice and goals, as well as the UNESCO *Convention on Cultural Property* (1970), encouraged rethinking and reevaluation of that practice. Archaeologists in a number of countries began suggesting that the commercial market in antiquities led to the permanent loss of information and to increased site destruction by essentially encouraging looting to meet the demands of the market. That is, they argued that the practice of collecting brought about results that had become antithetical to the contemporary goals of archaeology (see the *Journal of Field Archaeology's* regular feature on the Antiquities Market, renamed Archaeological Heritage and Ethics in 2008, for discussions that show changing attitudes and concerns about this and other archaeological heritage issues over the decades since the journal's inception in 1974).

Soon, participation in the antiquities market was seen as a serious problem by most professional archaeologists. By 1990 the membership of the Archaeological Institute of America (AIA), the primary professional organization for classical archaeologists in North America, had reached sufficient consensus on the problem to adopt a brief code of ethics (Professional Codes of Ethics and/or Standards of Professional Conduct can be found on the web sites of most professional organizations) for both its professional and numerous nonprofessional members. Each of the code's three statements addresses an aspect of the commercial market – calling for all excavation to be carried out to the highest standards by qualified personnel and for AIA members to refuse to participate in the illicit market in antiquities and to report illegal excavation and trade in antiquities to appropriate authorities. The professional culture had changed sufficiently to change ethical practice.

Four years later the AIA adopted a Code of Professional Standards to guide its professional members toward ethical choices. Members, most of whom are academics, generally do their fieldwork in the Mediterranean area, under permits, laws, and limitations imposed by the countries in which they work. They are often members of large, interdisciplinary, and international teams that work on extensive sites over many years. Directors assign publication responsibilities to individual scholars, who claim exclusive access to the relevant data until it is published. Reading the AIA Code of Professional Standards, one can discern the kinds of problems that came from that particular archaeological practice. Of 20 itemized points in the code, six (I.5, III.1, III.5, III.6, III.7, III.8) address aspects of behavior related to team projects and publication, that is, they reflect concerns arising from the specifics of AIA culture.

In the 1990s the Society for American Archaeology (SAA) also developed its Principles of Archaeological Ethics. The SAA is the primary professional organization for archaeologists practicing in the Americas, including many academics, although a majority of members work in government and business settings. While also concerned about the antiquities market and looting – in 1960 the SAA had already adopted Four Statements for Archaeology that included a prohibition on the buying and selling of artifacts (McGimsey 2002: 16; Lynott 2003: 20) – in the 1980s and 1990s the membership of the SAA was especially focused on issues related to reburial and other concerns of native peoples (Levy 2002: 96), issues that had less resonance in the classical world. The SAA Principles address many of the concerns also addressed by the AIA, but the emphasis on consulting and cooperating with "affected groups" is more prominent than in the AIA's document, while concerns about timely publishing are less extensively noted. The SAA document reflects the culture of the SAA in the 1980s and 1990s.

The codes of archaeologists in other parts of the world address most of the issues included in the AIA and SAA codes, reflecting the commonality of archaeological culture, but each code has different emphases and some items that are specific to the time, place, and organization. The Swedish Archaeological Society, for example, for its Principles for Good Archaeological Practice, adapted the Code of Practice of the European Association of Archaeologists, making adjustments to reflect specific situations encountered by, and the concerns of, Swedish archaeologists (Broadbent 2004: 88).

Other professions concerned with aspects of heritage have broadly similar histories and variations in their codes of ethics and practice depending on the nationality and particular focus, or culture, of the organization. Archaeological conservators, for example, once looked rather narrowly at *the object* and were primarily concerned with the reversibility of treatments, with concerns about conservation as opposed to restoration, and with maintaining full and accurate records of treatment (Tubb 1995: 256). As public discussion about the destructive nature of the antiquities market became more frequent in the 1980s and 1990s, more and more conservators recognized the role their profession unintentionally played in aggravating those problems (Elia 1995; Tubb 1995; Sease 1998). One result was that the American Institute for Conservation of Historic and Artistic Works (AIC) Code of Ethics and Guidelines for Practice now call on conservators in the USA to, for example, be aware of laws and regulations relevant to their practice, including those concerning excavated objects, human remains, and stolen property. The European Confederation of Conservator-Restorers' Organizations Professional Guidelines (II): Code of Ethics (Article 2) also draws attention to the need to practice in accordance with national and European laws, specifically mentioning those that deal with stolen property.

An official comment that accompanies the AIC statement goes on to say that:

> "Conservation professionals should be aware of and adhere to non-governmental charters and other recognized documents that have a bearing on professional activities (e.g. Venice Charter, New Orleans Charter, Secretary of the Interior's Guidelines for the Preservation of Historic Buildings, ICCROM's Site Management Guidelines for World Heritage Sites) and Codes of Ethics of allied professional organizations (e.g. American Association of Museums, American Association for State and Local History, Society of American Archivists, Society for American Archaeology, Association of Art Museum Directors)." (Commentary under item 3, Laws and Regulations, Guidelines for Practice, AIC, www.conservation-us.org7/13/11).

The more frequently the various professions interact on heritage issues, the more each learns about the concerns of the others and the more likely all the professions are to recognize common ground and to address similar issues in their codes. Nevertheless, opportunities for disagreements among (indeed, within) professions about the best way to proceed on any heritage issue remain abundant. Codes of ethics and best practice were never intended to cover every possible situation nor to provide easy or absolute answers on how to proceed in every situation. Ethical conflicts rarely involve clear rights and wrongs. Explicit codes of professional ethics provide useful guidelines, ways to think ethically about problems, but all require careful interpretation in each particular circumstance. Everyone involved needs to understand that others' arguments are not evil or wrongheaded, but stem from the cultural differences among the various professions and non-professional stakeholders. Everyone needs to listen to each other carefully and consider the arguments in the context of the source culture. Each professional may find it helpful to consult with her or his professional organization's committee or group in charge of the ethical code and standards. Individuals on these committees have a great deal of experience in ethical disputes and may well have been through or know of situations similar to the current one and be able to offer advice and suggestions for resolving the disputes. Those committees also need to know where the codes are creating or not helping to resolve problems. Each specific situation has the potential to be the catalyst for changing a professional culture and for revising its code.

Heritage Landscapes

Elizabeth Kryder-Reid
Department of Anthropology and Museum Studies, Indiana University-Purdue University Indianapolis (IUPUI), Indianapolis, IN, USA

Introduction

Heritage landscapes, also referred to as cultural landscapes, represent some of the most well-known landmarks on earth and some of the most contentious. Their complexity, scale, and significance often mean that these landscapes are valued for different reasons and used for conflicting purposes, creating challenges for those who seek to manage and preserve them. An increasing awareness of the importance, multivalence, and political import of heritage landscapes has brought them to the fore of debates within the heritage community over issues of control, access, purpose, and preservation.

Definition

The term "heritage landscape" brings together two concepts, each of which is a cultural construction. As W. J. T. Mitchell (2002: 1) has suggested, landscape is "a process by which social and subjective identities are formed" and should be thought of as a verb rather than a noun. Similarly, heritage is a product of the shared values and beliefs predicated on the relationship of past and present (Lowenthal 1998) and is therefore inherently political (Smith 2006; Harrison 2012). The definition of heritage landscapes is, therefore, dependent on their political, economic, and social contexts, and they may be valued for multiple reasons, including aesthetic, historic, scientific, social, and spiritual (Burra Charter 2013). They include officially recognized sites such as those designated by UNESCO as World Heritage Sites and those listed on the US National Register of Historic Places, but they also include landscapes without formal sanction but

meaningful to descendant communities or other groups.

Key to most definitions is the recognition that heritage landscapes contain both natural and cultural resources, and the complexity of documenting, managing, protecting, and interpreting the landscapes often stems from the interplay of the two. The UNESCO 1972 Convention Concerning the Protection of the World Cultural and Natural Heritage linked notions of cultural and natural heritage, and its operational guidelines divide cultural landscapes into three main categories depending on the "manifestations of the interaction between humankind and its natural environment" (UNESCO 2008: 86).

Heritage landscapes include all manner of forms, scales, and time periods. An inventory of heritage landscapes in Massachusetts, for example, identified forms as varied as scenic roads, formal gardens, cemeteries, shipyards, and cranberry bogs (Massachusetts Department of Conservation and Recreation 2008). Various criteria for assessing and classifying heritage sites have been developed since the 1964 Venice Charter (Birnbaum, ed. 1996). As of 2017, there are more than 1073 World Heritage Sites recognized as having "outstanding universal value" in 167 states parties (UNESCO 2017), and there are at least 40 documents at the international and national level establishing definitions and policies for the documentation and conservation of heritage sites and little consensus in definitions of heritage among nation-states (Ahmad 2006: 299).

Historical Background

While cultural landscapes are as old as humanity, their study has been framed over time by different disciplinary approaches. For example, art and architectural historians look to the genre of landscape painting as the genesis of the concept of landscape. While the study of geography dates to classical times, geographers point to the work of Otto Schluter and Carl O. Sauer for the development of cultural geography with its increasing attention to the variety of vernacular traditions (Jackson 1984) and the diversity of expressions along societal divisions such as race, class, and ethnicity (Noble 1992; Hayden 1995; Schein 2006; Tolia-Kelly 2010).

In archaeology, interest in environmental factors creating conditions for social complexity, domestication, and urbanization led to a focus on landscape. For example, Karl Wittfogel (1956) identified water control in the landscape as a central factor in the development of complex societies. Gordon Willey's (1953) survey of the Virú Valley demonstrated the utility of the systematic investigation of settlement patterns. Statistical models of site prediction and sampling strategies for regional surveys became essential methodologies for the study of archaeological landscapes. Increasing sophistication of environmental modeling, the advent of GIS with its integration of data layers, improvements in remote sensing, and the development of three-dimensional computer-generated reconstructions of space have advanced the study of past heritage landscapes. It has become possible, for example, to create virtual reality experiences with "fly-throughs" of ancient villages, reconstruct ceremonial processual routes, recreate acoustic environments, and trace the succession of environmental changes as ancient harbors silted in and became farmland. The use of technology has also helped to connect astronomical and terrestrial landscapes with reconstructions of lunar and solar alignments in landscapes such as Stonehenge, Cahokia, and Chaco Canyon.

The multidisciplinary study of heritage landscapes has been accompanied by the development of policy and legislation for the management of these cultural resources. In the USA, federal legislation dates to 1906 with the passage of the Antiquities Act that included the designation and protection of national monuments on federal land. The 1966 National Historic Preservation Act established the National Register of Historic Places. Australia's Burra Charter (1979, rev. 2013) has become a model for the management of cultural landscapes (Silberman 2016: 29). The increasingly sophisticated standards for heritage landscape management and protection have been accompanied by an intensification of the economic and political stakes of heritage sites. Even

as governments have used heritage sites for political purposes and entrepreneurs have developed them for economic gain, some countries have created policies to support more equitable and inclusive principles of heritage management. For example, the Burra Charter (Australia ICOMOS rev. 2013) includes a Code of Ethics of Coexistence as well as practice notes on Indigenous heritage, intangible heritage, and cultural routes. In the USA, the National Register of Historic Places criteria was expanded in 1990 to include traditional cultural properties in which the "significance is derived from the role the property plays in a community's rooted beliefs, customs, and practices" (National Park Service 1998).

Key Issues

Current debates in heritage landscapes often stem from their contested use and values. Sites such as Devils Tower National Monument in the Black Hills of Wyoming and Uluru (Ayres Rock) in Australia have pitted the interests of rock climbers against Indigenous peoples for whom the sites are sacred. These tensions challenge the authority vested in civic entities with the rights of descendant communities and test principles such as the separation of church and state and issues of sovereignty. Other contested heritage involves privileged narratives and the political implications of highlighting certain time periods or peoples, while others are marginalized, as at the California missions (Kryder-Reid 2016) and Luang Prabang (Dearborn and Stallmeyer 2010). Memorial landscapes have been charged loci of politicized debate about how societies commemorate the past, particularly the dark heritage of totalitarian and racist regimes and historical figures (Macdonald 2008; Upton 2015).

Recognizing the multivalence of heritage sites and acknowledging the role of heritage sites in the politics of identity have implications for practice. The range of values of heritage landscapes is being incorporated into official designations of significance, such as the inclusion of "traditional cultural properties" on the US National Register (King 2003). Similarly, a more inclusive perspective on landscape values is changing methodologies that some archaeologists are deploying to understand the meaning and significance of cultural resources and to "decolonize" long-standing heritage practices (Lonetree 2012). For example, archaeologists consulted with tribal elders as part of investigations of the ancestral homelands of the Zuni and Hopi in the San Pedro Valley of Arizona (Colwell-Chanthaphonh and Ferguson 2006).

Another response to the concerns about a lack of inclusive decision-making about heritage landscapes is the increasing use of collaboration and consultation in site management. For example, Hadrian's Wall in northern England exemplifies the potential for collaborative management plans to negotiate the interests of diverse stakeholders. Begun in 122 CE as a military fortification along the Roman frontier, today it is a World Heritage Site running 118 km through multiple legal and civil jurisdictions and incorporating public lands and more than 700 private property owners. The contemporary land use is complicated and includes urban centers, pastures, hiking trails, and archaeological research sites. This complex site is managed by a collaboration of numerous national departments and agencies, as well as a multitude of local county and district councils, which have developed a 5-year rolling management plan that accommodates the wide-ranging interests of those who manage, use, and enjoy the site (de la Torre 2005; Norman 2007).

Heritage landscapes are being used as catalysts or arenas for public dialogue about important social issues (Bender and Winer 2001; Shackel 2001; McAtackney and Ryzewski 2017), and they are being mobilized in social justice and political activism, as in the work of members of the International Coalition of Sites of Conscience (Ševčenko 2011). For example, scholars are examining the heritage of landscapes associated with marginalized people such as the immigrants (Morgan et al. 2005), migrants (Byrne 2016), and the homeless (Zimmerman et al. 2010; Kiddey 2017; Singleton 2017). Sites such as Russia's Gulag Museum at Perm-36 and the District Six Museum and Robben Island in South Africa advocate reconciliation and social justice, and they

demonstrate both the promise and challenges of realizing political change through heritage landscapes (Garuba 2007; Rassool 2007).

Future Directions

Heritage landscapes are threatened by risks from increasing development, particularly economic pressures for immediate profit over longer-term stewardship. Climate change also raises the specter of inundation for heritage landscapes in low-lying coastal and island communities, as well as other threats from increasing drought, erosion, and flooding caused by changing precipitation patterns and intensifying weather events. In other areas, political instability and extremist regimes pose threats to heritage landscapes and monuments, such as the Taliban's destruction of the Bamiyan Buddha statues in 2001 and the struggle between Russia and Ukraine over the interpretation of Tauric Chersonese, a UNESCO World Heritage Site in Crimea. Other challenges for the future of heritage landscapes include concerns about the "Heritagization" trend and critiques of the unwieldy and impractical implications of global heritage policy (Zan et al. 2015). Others have criticized the institutionalization of the heritage industry as part of broader neoliberal trends and challenged the use of heritage places as instruments of state power (Silberman 2016).

In times of conflict, critique, and contracting resources, it is tempting to be pessimistic about the future of heritage landscape, but projects continue to demonstrate innovative ways to engage new audiences and to advance participatory heritage through interpretation and preservation practices. For example, technological innovations have the potential to increase our capacity to understand and reconstruct past landscapes. The same sophisticated visualization and analytical tools offer the possibility of sharing the stories of past landscapes in innovative and engaging ways with ever-broadening audiences. Social media and the ubiquity of personal digital devices have created capacities for crowdsourcing and citizen-curated interpretations of cultural resources in ways that are transforming traditional cultural authority relationships. Scholars are expanding the scope of heritage landscapes to include seascapes (Pungetti 2012) and interplanetary space (Gorman 2005). While countries continue to use heritage to support their national interests, at the same time, advocates of democratized heritage and equity of access are promoting the principle of heritage as a human right that knows no geopolitical borders (Von Droste et al. 1995; Silverman and Ruggles 2007; Hsiao et al. 2017; Silverman et al. 2017).

Heritage Legislation, The Introduction of: Disciplining Through Law

Thomas W. Neumann
Diachronics Division,
Wentworth Analytical Facility,
Lilburn, GA, USA

State of Knowledge and Current Debates

Introduction

Legislation protecting cultural heritage emerged first in classical antiquity in the Mediterranean Basin as royal edicts by Alexander the Great and later by Rome were proclaimed to protect archaeological remains deemed to represent the heritage of the state (Fig. 1). This was driven by the recognition in the Mediterranean Basin that physical materials from the past represented a record of cultural heritage for subsequent generations. Similar proclamations and expectations developed later in the eighth-century Islamic caliphates of the Middle East and in imperial China in the eleventh century and then at the national level in Sweden in 1666 and Russia in 1704. All of this set a cultural precedent such that the emergence in Europe of Humanistic Antiquarianism along with Enlightenment values drove interest in the archaeological past, precipitating sequentially ethnological and archaeological societies, and then acceptance in the 1820s of national heritage legislation meant to protect the cultural patrimony of Greece and the newly independent states of Latin America. By the end of the nineteenth century, heritage legislation of some form was common across Europe and the Mediterranean Basin but was just starting to emerge within the Western Hemisphere. This legislation was often aimed at the access to and movement of archaeological materials and frequently was restricted to properties held at the national level. Laws giving the state the right of first refusal on cultural properties, regardless if owned privately or publically, developed early in Greece and Mexico, followed by the Ottoman Empire in the last quarter of the nineteenth century (and later becoming rather common for many Latin American nations).

National heritage legislation across South and East Asia, Oceania, and sub-Saharan Africa was introduced through some affiliation with European colonial powers such as the British Commonwealth/Commonwealth of Nations; in imitation of laws of such states; or in response to regional or international agreements, such as those promulgated by UNESCO (United Nations Education, Scientific, and Cultural Organization). In China and Japan, for example, such laws started emerging in the late nineteenth century, in former British colonies, usually close to the time of independence from Great Britain, particularly in sub-Saharan Africa.

Heritage Legislation, The Introduction of: Disciplining Through Law, Fig. 1 Emergence of heritage legislation in Europe and the Mediterranean Basin, with reference to global impact

International (as distinct from imperial or intra-state) heritage legislation first appeared with the treaties between France – under Charlemagne in the eighth century and Francis I in the sixteenth – and Islamic caliphates for protection of religious heritage sites in the Levant (Fig. 1; Table 1). Various bi- and trilateral agreements developed between the Ottoman Empire and Britain and France in the nineteenth century, also protecting heritage properties across the greater Middle East.

In 1899, the first Hague Convention, a multi-national instrument protecting heritage properties in times of war, was passed (Fig. 1; Table 1). It was amended in 1907 and again in 1935 as part of

Heritage Legislation, The Introduction of: Disciplining Through Law, Table 1 Regional and global heritage conventions, resolutions, recommendations, and declarations

Regional	
1933	Treaty on Protection of Artistic and Scientific Institutions and Historic Monuments (approved at the seventh International Conference of American States)
1969	[London Convention] The European Convention on the Protection of Archaeological Heritage [see also 1992 below]

the Washington Pact. However, it was not until after World War II and the establishment of the United Nations that international agreements – in the form of conventions, recommendations, and declarations – were promulgated globally for the protection of cultural properties. Under the aegis of UNESCO, these instruments set out definitions of cultural properties along with expectations for their protection – both from damage either from domestic activities or from war and from looting and illicit trafficking. The UNESCO instruments, though, found acceptance for two reasons. The first reason was because issues of heritage legislation had been considered earlier across Europe, the Mediterranean Basin, and the Western Hemisphere – thus except for China essentially the founding nations of the United Nations. The second reason was because many of the eventual signatories to the UNESCO instruments either were or had been possessions/cultural descendants of those founding nations.

Definitions

"Heritage" here refers to "cultural heritage" in a material remains, archaeological sense, which in turn is used interchangeably – despite the definitions given below – with "cultural property" as used and/or understood by UNESCO in nine recommendations, six conventions, and a declaration all promulgated from 1954 to 2015. UNESCO (1972: I.1.) defined "cultural heritage" as:

> . . .monuments: architectural works, works of monumental sculpture and painting, including cave dwellings and inscriptions, and elements, groups of elements or structures of special value from the point of view of archaeology, history, art or science; groups of buildings: groups of separate or connected buildings which, because of their architecture, their homogeneity or their place in the landscape, are of special value from the point of view of history, art or science; sites: topographical areas, the combined works of man and of nature, which are of special value by reason of their beauty or their interest from the archaeological, historical, ethnological or anthropological points of view.

UNESCO (1970: Article 1) stated that "the term 'cultural property' means property which, on religious or secular grounds, is specifically designated by each State as being of importance for archaeology, prehistory, history, literature, art or science," going on to specify that this includes both non-portable items like architectural features, archaeological sites, and the settings of such and portable items ranging from artifacts through portions of those architectural features and archaeological sites. The term "cultural resources" commonly is substituted for "cultural property" among professionals in some nation-states, the USA and South Africa being examples. In the USA, the term is found not in heritage legislation but rather in advisory documents and in its National Environmental Policy Act.

"Heritage legislation" refers to the legislation meant to govern the recovery, use, protection, and possession of elements of the physical or conceptual world produced by a particular human culture. There are basically four levels of legislated governance within nation-states: (1) "legislation," which here is coincident with "laws" and "acts" (seen to include statutes passed through some kind of parliamentary/legislative body; "common law" developed through a judicial system such as in classical Rome, Great Britain, and their scions; constitutional provisions and articles; and "royal proclamation," "royal edict," "imperial fiat," or equivalent); (2) "ordinances," which are enacted by a governmental entity and provide the authority as well as intent; (3) "regulation," which specifies how that legislation is to be accomplished in the everyday world; and (4) "guidance," which aims to clarify specific applications of those regulations by the particular regulatory branch of government. Establishment of governmental agencies, offices, or ministries, along with designated administrative/enforcement responsibilities that may not be clearly set out in statutory law, also can be included under a general rubric of heritage legislation in that such entities are implementing or exercising some sort of governmental authority. This has been very common across Middle and South America.

"Treaties" might also be viewed as a form of legislated governance. In essence, these are international agreements – approved by the participants – that can ask, cajole, or require a signatory to abide by a series of rules both within the nation-state and in its interactions with other

nation-states. For example, the UNESCO conventions, recommendations, and declarations can be placed here, as can the various Hague Conventions and League of Nations mandates along with the A.D. 1535 treaty of Francis I of France with the Ottomans for the protection of religious heritage sites in the Levant.

Finally, it should be noted that heritage legislation in the sense considered here – material cultural property associated with archaeology – overlaps with the kind of heritage legislation covered by copyright law and similar laws protecting intellectual property, traditional knowledge, and traditional cultural expression. This touches on the separation of tangible and intangible heritage, which is beyond the scope of this entry. The 2002 Pacific Model Law, with its guidelines for protection of traditional knowledge and expressions of culture, is an example of where that form of heritage legislation treating intellectual property and other intangible heritage issues conceptually adjoins the kind of heritage legislation under consideration in this article.

Historical Background

Heritage legislation is a product of the Western Intellectual Tradition but found traction worldwide because many nation-states early on held that the materials of the past were of value to their own nation-state identity in some way and as such should be protected, both within national borders and from removal from the country. Globally, heritage legislation grew from efforts confined to limited territorial governance – fiefdoms, pre-industrial countries, and empires – to both nation-state mandates and international agreements and currently exists at both levels. While emergence varied in particular across the world, in all cases, it grew first from a concern to protect a culture's/nation's ownership over materials associated with its past and in all cases depended upon recognition that there was a "past" represented by material remains from which the "present" had emerged.

Ignoring common cultural proscriptions on the disturbance of burials and the somewhat less common but not unusual proscriptions on the disturbance of former living sites, both of which are social sanctions against disturbance of cultural property and archaeological sites, formal governmental or religious decrees effectively protecting cultural heritage existed in many pre-industrial states. And since all pre-industrial states have or had a state religion, secular or religious origin of prohibitions and regulations comes out to the same thing.

Antiquity

Heritage legislation in the form of pre-industrial state policies, edicts, and similar governmental actions are known in pre-modern times for two regions: the general Mediterranean Basin area and China. The actions that emerged in the Mediterranean Basin form the basis of modern heritage legislation and as such will be considered here. Those of China provided a cultural predilection for emplacing the sort of heritage legislation that would be promulgated globally from the European-Mediterranean Basin; the antiquity of their heritage legislation will be considered when "Asia" is discussed below.

Recognition of a past that is accessible through some sort of excavation is one requirement for archaeological heritage legislation to make any sense. However, recognition by one culture of the evidence for a past does not mean that another culture will interpret that evidence in the same way: classical Greece and Rome long excavated, recovered, reassembled, displayed, and interpreted past remains, both what would now be identified as human and paleontological. However, those remains were interpreted in keeping with the given culture's cosmologies, such that mammoth and mastodon bones became the bones of giants or the war elephants of Alexander the Great: *Protoceratops* skulls, those of griffins (Mayer 2000: 48–49, 55). People in the Mediterranean Basin antiquity were aware that people lived in the past and that physical remains of them were present; thus, the finding of things was used to make known things better understood and interpreted in terms of their understanding of the past (Mayer 2000: 157–163).

Herodotus in his *Histories* in the fifth century B.C. talked of Cimmerian remains left behind in lands since occupied by Scythians, as well as of

the fortifications left by Darius in his futile pursuit of those Scythians (Fig. 1). He spoke, too, of remains left by Ionians and Carians testifying to their early presence in Egypt. He identified ruins with events from the Trojan War, effectively recognizing that actions in the past left material remains from a world that was politically much different than his own time.

Arrian recounted in the *Anabasis Alexandrou* Alexander's (356–323 B.C.) defense of Macedonian and Persian antiquities as matters of state policy, since those items – tombs, especially that of Cyrus the Great in 324 B.C., and temples from centuries past – provided justification of Alexander's political and territorial attainments (Fig. 1). This is an early example of heritage legislation through imperial fiat: the penalty was that the perpetrators were sent to discuss their desecration face-to-face with the long-deceased Cyrus.

By the first century B.C., the wealth and power of imperial Rome was such that archaeology, along with jurisprudence, history, religion, and philosophy, became a favorite area of study by educated – upper class – Romans (Rostovtzeff 1960: 160). The Roman Empire limited what would now be called archaeological research. Under Augustus, there was a campaign to restore ancient shrines as part of an overall effort to reaffirm the character of ancient, pre-imperial Rome (Rostovtzeff 1960: 188–189): "the relics of Rome under the ancient kings. . .were carefully preserved" (Fig. 1).

The mother of Constantine, Empress Helena, undertook in A.D. 326 what amounted to a sustained and coordinated archaeological exploration of what is now Israel, driven by a desire to locate and then protect Christian religious heritage sites (Fig. 1). This exercise, along with Christianity becoming the state religion of the Eastern Roman Empire, resulted in a period of pilgrimage that continued well into the time of Islamic control of the region, prompting Caliph Harun al-Rashid in the eighth century to conclude a treaty with Charlemagne for Christian protection of those religiously significant sites (Silberman 1982: 7). For all practical purposes, that treaty ended first with the onset of the Crusades (the Crusades out of Europe in the twelfth century were exercises driven by a desire to defend or secure cultural property – and thus protection of cultural-religious heritage) and then later with the collapse of the last Crusader Kingdom in A.D. 1291. Protection of what would be deemed explicitly archaeological sites – in this case again, Christian religious sites – was re-established in A.D. 1535 by Francis I of France in a treaty with the now-governing Ottomans.

It was during the Abbasid Caliphate (A.D. 750–1519) that Baghdad was founded (A.D. 762) and later became a center of learning, drawing to it the scholarly community that had flourished for centuries at nearby Gundeshapur in what was then southwest Persia. That community, combined with the nighttime dream by Caliph al-Ma'mun in which Aristotle appeared, had precipitated an expansive era of scholarly research, including sustained, state-sanctioned efforts to identify and then bring to Baghdad earlier writings in Greek, which were then translated into Arabic. This then was state-sponsored acquisition of cultural properties – early books and documents – because of their heritage value, a form of acquisitive proactive heritage legislation by state policy (Fig. 1). However, by the late eleventh century, there was a reaction against al-Ma'mun's legacy and "foreign sciences" across the Abbasid Caliphate, which resulted – when the Ottomans inherited power in the sixteenth century – in a continuation of a lack of recognition of the importance of material cultural heritage that enabled the expansion of archaeological work, and removal of antiquities, from the Levant into the late nineteenth century.

Something similar transpired in what is now Spain, to where the Umayyads, deposed by the Abbasids, moved in A.D. 756. Cordova, Toledo, and Granada became, like Baghdad, cosmopolitan centers of learning. As with Baghdad, efforts were made to translate earlier works in Greek and Latin, identifying a link between a classical past that would be recognized. Indeed, it was the Islamic civilizations of the eighth through fifteenth centuries that preserved much of the earlier Mediterranean Basin intellectual and cultural heritage. And it did so intentionally by obtaining

then moving earlier works – the Elgin Marbles of their day – in those classical languages to a new place.

Societal Basis for Introduction of Heritage Legislation

Heritage legislation, particularly as it bears upon archaeology, is the legislation normally forwarded, promoted, and then enacted by the upper social strata of state-level societies, but which preserves information about – potentially – everyone's past stored in the physical remains found archaeologically, architecturally, or otherwise materially. Two things are required: recognition that there is a physical past, in the form of archaeological materials, present to be protected, and recognition that those archaeological remains are worth protecting.

Archaeological remains exist in a "destroyed-as-read" medium, which is how initial computer memories were configured (Silberman 1982: 178; The La Valetta Convention 1992 Article 1.1; Neumann and Sanford 2010: 12). This is why regulations exist for the protection of those long-term physical records of the past: Extracting information about the past from a destroyed-as-read matrix requires personnel trained in meticulous recordation skills along with research protocols aimed at doing that recordation. All current heritage legislation has that embedded as understood and in this respect is subsumed under what is known in the USA (United States of America) as "public trust doctrine." "Public trust doctrine" holds that public lands, along with their contents, be they wildlife or cultural resources, are held in trust for the citizenry writ large (Brushkotter et al. 2011). Although not as explicitly stated, much of the heritage legislation currently in existence along with the UNESCO conventions assumes that this is understood (see Table 1).

The societal process leading to modern heritage legislation has been similar worldwide: It begins with the recognition of cultural heritage in archaeological materials and sites; shifts to a realization that those materials and sites are in some way imperiled, be it from looting, privateering, or inadvertent destruction; and then becomes a cause célèbre for the upper social classes, in the form of the ruling social class (e.g., Roman Emperor, Chinese Emperor, Ottoman Emperor), an upper social class social group (e.g., the Mount Vernon Ladies' Association of the Union in the USA), or scientific societies underwritten by the upper social classes (e.g., the Royal Society of Canada; nineteenth-century excavations in Jerusalem). In the Western Hemisphere as well as Europe, the scientific societies that emerged starting in the mid-eighteenth century as an outgrowth of Humanistic Antiquarianism, normally dominated by the upper social classes with access to those who legislate (who often were themselves members of the given scientific society and even now, as with the Smithsonian Institution in the USA, are ex officio members), eventually succeed in having legislation either enacted (e.g., the USA, Canada, Great Britain) or set forth for a larger community of nations (e.g., the Council of Europe or the United Nations), from whence it then is embraced by the given state of concern as a starting point for its own heritage legislation. The British Empire was particularly instrumental in distributing heritage legislation, or the desire to have such, throughout the world. States adjacent to those Empire – later Commonwealth – states often adopted or were inclined, when the various UNESCO protocols emerged, to adopt similar laws. The British Empire served as a geographic-conceptual conduit for heritage legislation.

Introduction by Region of Modern National Heritage Legislation

Heritage legislation as a global initiative on a global scale started as a response to European actions within the Mediterranean Basin and was refined in the European/Mediterranean part of the world, to be later taken up by the cultural descendants of those nation-states. Thus, the first legislative exercises were spread among lands as disparate as Spanish America and the Ottoman Empire and were then coalesced among those when they became the newly independent

nation-states of Latin America and the Mediterranean Basin. Those exercises were further consolidated within the British Empire and subsequent Commonwealth of Nations and then through global organizations that were developed from that overall European/Mediterranean Basin/Western Hemisphere impetus. This global-level consolidation began first with the League of Nations, which facilitated wider acceptance of the Hague Conventions, and continues with the United Nations and the UNESCO conventions and resolutions that drive global heritage legislation today.

Europe and the Near East/Mediterranean Basin

Heritage legislation has at least a 2,400-year history in Europe and the Mediterranean Basin, dating first from Alexander the Great's protection of state-significant heritage sites and then from the first-century B.C. Imperial Roman requirement that, during construction within Rome, relics and architecture associated with the founding and early days of the City were to be preserved (Fig. 1).

Although Phillip II declared in 1573 that all indigenous heritage materials in Spanish America were the property of the Crown, thus reflecting the view that the state had jurisdiction of cultural property when it so chose, that restriction did not apply to Spain proper. It did, though, reflect an emerging regional view of a national material patrimony contained within cultural property. Sweden's Royal Proclamation of 1666 (also known as the Ordinance of 1666), protecting graves, monuments (including stones with runic inscriptions), sites, and antiquities in general (particularly those related to ancestral "greatness," especially those related to the royal household) from "interference," were the earliest legislative statements protecting cultural heritage. Under Peter the Great, the first Russian antiquity law was set forth in 1704. Similarly, Portugal in 1727 established the Royal Academy of History to protect architectural elements, although this was not really acted on. Napoleon, during the occupation of what would become Italy, in 1798 undertook systematic restoration and heritage protection of elements identified during archaeological excavations.

Through to the late eighteenth and early nineteenth centuries, heritage legislation in Europe and the Mediterranean Basin was forwarded by royal or imperial directive, if perhaps for no other reason than it represented the structure of most national governments. The intellectual climate of Europe at the time included the founding of national scientific and ethnologic societies (e.g., Royal Society [England] in 1662; ethnographic societies were established in Paris in 1839, London in 1841, and New York in 1842; ethnology as a field dates from around 1828; ethnography, 1834; and archaeology qua archaeology, 1837, with the Imperial Russian Archaeological Society established in 1846), all of which were products, first, of Humanistic Antiquarianism (which recognized that there was a "past" from which the "present" emerged) and then of the Enlightenment along with the expansion of European powers to overseas possessions.

The sudden emergence of heritage legislation during this time is not surprising (Fig. 1). For example, Russia's Alexander I prepared a register to protect archaeological (especially Greek) sites on the Black Sea in 1805, a list expanded for all of Russia by Nicholas I in 1829. Sweden revised the 1666 Ordinance in 1828 and appointed the first national antiquary. During the Greek War of Independence (1821–1829) establishing modern Greece, the Minister of Internal Affairs issued decrees ordering collection and then safekeeping of antiquities on school premises (1825) and the protection of the Athenian monuments (1826). In 1828, Article 18 of the Greek Constitution of the Third National Assembly in Troezen directed the head of state to make sure Greek antiquities were not sold or otherwise removed from Greece. In 1834, Greece issued the first archaeological laws, developed by G.L. von Maurer, declaring in part that "all the antiquities in Greece, being works of the ancestors of the Greek people, are considered as national property of all the Greeks in general." The law regulated, among other things, reporting of discoveries, ownership of antiquities, and excavation procedures. In many ways, the Greek law from 1834 became the inspiration for

national-patrimony-oriented legislation across the Western world (e.g., Mexico's 1934 *Law for the Protection and Conservation of Archaeological and Historical Monuments*, *Typical Towns, and Natural Beauty Sites*).

Similarly for the period, the Spanish Academia de San Fernando, in response to the establishment of the publication *El Artista*, began in 1836 protecting convents and monasteries. This led to a series of government orders and rulings for protection, such as the 1844 government commission to establish inventories and evaluate national heritage. France established the Commission Nationale des Monuments Historiques in 1837 in response to the damage done during the Revolution and Napoleonic era; the Commission would eventually become the Ministry of Culture.

In 1830, efforts by American merchants to develop an exclusive trade route into the Ottoman Empire resulted in the American-Ottoman Friendship Treaty. This enabled US Navy Lt William Lynch to obtain a permit (firman) to pursue what we would now call an archaeological exploration through what is now Israel and Jordan. Indeed, it can be argued that, beginning around this time, it was the competition among European powers for access to antiquities in the eastern Mediterranean that precipitated the second wave of heritage legislation, shifting it from a concern with internal protection of national heritage to that of protection of a shared cultural heritage – the religious and classical civilization basis of European civilization – along with concerns about the removal of that heritage from the nation/territory in which it originated.

From the mid-nineteenth century to the early twentieth century saw the beginnings of regional heritage legislation in the form of various internal laws along with treaties and international mandates. It was also a politically unsettled time, seeing, for example, the unified Kingdom of Italy proclaimed in 1861. The 1858 Treaty of Paris shifted protection of "the integrity" of the Ottoman Empire to Britain and France, which here included retaining exclusive access to the archaeological/cultural resources of the region (Silberman [1982: 68] argued convincingly that the Crimean War grew sequentially from the conflict between Russia and France over control of cultural materials in Palestine). Even allowing that, the first formal legislation to regulate cultural property in Turkey was put forth by the Ottomans in 1869 (Roosevelt and Luke 2006: 181). After the mid-1500s, the Ottoman Empire was seriously dysfunctional; Egypt, for example, had long been conceded to be under its own control, which Egypt had succeeded in doing by simply ignoring Istanbul. This was a period of considerable political instability. In the 1800s, for instance, Egypt, while like Tripoli [somewhat coterminous with the current nation of Libya] at the time nominally under the control of the Ottoman Empire, in reality, was governed by several European powers, principally Great Britain.

However, even allowing for British and French jurisdiction over doing the archaeological research, the Ottomans nevertheless retained control over the distribution of the recovered cultural properties. At least on paper. In 1874, the Empire promulgated the *Ottoman Antiquities Law* for regulation and protection of antiquities trafficking by foreigners. This was the antecedent to the *Ottoman Law of 1884*, which "established national patrimony (ownership) over all artefacts in the Ottoman Empire" (Kersel 2006: 24), declaring further that Turkey was the sole owner of its own cultural heritage. That 1884 law also regulated archaeological investigations: although very late to realize the financial value of controlling its cultural heritage, in 1888, the Ottomans detached Jerusalem administratively from the Pashalic of Sidon and transferred control directly to the Sublime Porte to better control – and tax – excavations and recovered artifacts from the plethora of religious-archaeological expeditions (Silberman 1982: 154–155).

It was also during this period that in 1899 Greece replaced its *Law of 1834* with *Law BXMS – 2646*, establishing that all Greek antiquities, without exception, were the property of the state, as well as the state's right to acquire all antiquities after paying compensation. This held regardless of where on the planet those antiquities were. The 1899 Law was modified in 1914, 1921, and 1932, redefining what antiquities were under

what kinds of state jurisdiction. Understanding the controversy over repatriation of the Elgin Marbles to Greece – which is not necessarily seen to be a repatriative act by everyone – requires awareness of this legislation.

Similar actions were happening elsewhere in Europe. Britain, for instance, after considerable effort by Sir John Lubbock enacted its *Ancient Monuments Protection Act* in 1882 (because of the extent and influence of the British Empire, arguably one of the most important heritage acts in history). Italy passed its *Monument Act* in 1902, providing an impetus for the restructuring of its heritage management. This seems to have grown out of private societies, such as the Society for the Defense of Old Florence (founded in 1898), established by the people from Great Britain enamored with Italian cultural heritage. During this time France passed the *Act of 1913*, which focused mainly on architecture and preservation of the setting of that architecture.

After the upheaval and political realignments from World War I, heritage legislation began expanding from the protection of national heritage to the protection of the cultural heritage in territories under the jurisdiction of external European powers (Fig. 1). Again, the idea for protecting the cultural heritage of countries other than one's own had been in the air certainly since the *Hague Convention of 1899*, which set out general rules of war. Under the Hague II Annex to that Convention, four articles (46, 47, 55, and 56) addressed the protection of private property and property deemed part of education, arts, and sciences. Those articles were clarified in the *Hague Convention of 1907*, where under the Hague IV Annex to that Convention articles 46, 47, 55, and 56 singled out the protection of cultural properties. Consonant with this broader, international view was the establishment of the League of Nations in 1920.

At the end of World War I, the Ottoman Empire was subdivided among the Allied powers and with it came a distribution over the control of antiquities. This redistribution brought to something of a conclusion an ongoing competition among European powers for access to the cultural heritage of the western Mediterranean since the late 1700s (see Silberman 1982) but in doing so presaged the kind of international heritage legislation/conventions – which form the basis for the heritage legislation in many nations that did not have anything like that earlier – that would emerge under the United Nations after World War II. The first step was the Antiquities Proclamation (British Mandate in Israel and Palestine) in 1918, which noted the region's cultural heritage and shifted it from a religious focus to a legal, secular status (since Helena in the fourth century, heritage regulations and attendant issues surrounding cultural property had been almost entirely religious in nature). This was soon followed by the Antiquities Ordinance in 1920, the primary goal of which was protecting archaeological materials by "vesting the ownership of moveable and immoveable cultural heritage in the Civil Government of Palestine" (Kersel 2006: 26). The League of Nations mandate for Palestine in 1923 explicitly outlined guidelines for excavation and preservation of archaeological remains while ensuring access to excavations and archaeological research for any member of the League, as well as giving authority to punish looters and unauthorized archaeological excavators. Out of this, in 1929, came Antiquities Ordinance No. 51, which "now forms the basis for all current domestic legislation concerning protection of cultural property in Israel and Palestine" (Kersel 2006: 26).

It was also during the interwar years that many nations updated or otherwise revamped their heritage legislation (Fig. 1): for example, Greece in 1921 and again in 1932, Italy in 1922 and again in 1931, and Spain in 1933.

After World War II – and with the devastation visited by the Nazis particularly on the architectural heritage of Europe – there were three emerging themes. For nation-states with a history of heritage legislation, the legislation was updated and the associated regulations refined to not just protect cultural property but to record that property in such a way that its physical destruction would not result in the complete loss of the heritage – the behavioral data content. This rendered the reactive nature of the earlier *Hague Conventions of 1899* and *1907* proactive for the protection of cultural property.

The second theme that emerged was an effort to establish international rules protecting cultural heritage, rules that ranged from prohibitions on international trade and the looting it spawns, through agreements on the protection of cultural heritage during times of war, to active recommendations on national cultural heritage protection. Such rules were an extension of national patrimony laws to the world, in effect recognizing that cultural property embodies the record of all human heritage, not just the heritage of a particular nation as that nation's boundaries are currently drawn. The Roerich Pact (see below), for example, drafted by a Russian artist and a Paris professor in 1930 and intended to declare all cultural properties neutral zones in times of war, was a product of the time.

The third theme after World War II was the emergence in nation-states lacking a history of heritage legislation. For members of the British Commonwealth, in addition to being signatories of *Environmental Protection and Biodiversity Conservation Act* of 1999 (EPBC Act), additional/subsequent national legislation often was patterned closely on that found in Great Britain. For non-Commonwealth nations, such legislation was based on UNESCO conventions or some combination of that and the legislation enacted in adjacent Commonwealth nation-states.

Not long after World War II, there was a restructuring of the global political landscape. Israel as a state was established in the western Mediterranean Basin and, with it, a re-emphasis on heritage legislation. In 1948, Israel replaced the 1929 *Antiquities No. 51 Ordinance* with the *Law and Administration Ordinance of Israel* (No. 1 of 5708) protecting cultural properties. Jordan, also part of that British Mandate, in 1966 replaced the same ordinance with *Jordanian Temporary Law No. 51 on Antiquities*, which in turn forms the basis of the 2012 Palestinian *National Charter for Cultural Heritage Preservation*.

Although outside of Europe, thematically consistent with the European lead in much of global heritage legislation, India as part of its independence from Great Britain in 1947 embodied in its Constitution Article 49, which states that "It shall be the obligation of the State to protect every monument or place or object of artistic or historic interest, declared by or under the law made by Parliament to be of national importance, from spoliation, disfigurement, destruction, removal, disposal or export, as the case may be," while Article 59A makes preservation of India's "composite culture" the duty of every citizen (Pachauri 2006: 236). From this came the 1947 *India Antiquities (Export Control) Act*, which in 1972 was augmented by the *Antiquity and Art Treasures Act*.

North America

North America resolves into two political entities that, for the purposes here, have different histories for heritage legislation. The first is Canada, which as a member of the Commonwealth has been strongly influenced by the heritage legacy of Great Britain and, to a lesser extent, France. It also has found inspiration in the heritage legislation of its neighbor to the south. The second entity is the USA, where the introduction of heritage legislation followed a pattern similar to that in Europe from the early nineteenth century onward. Both represent nation-states with two distinct cultural heritages: one left from the pre-European populations and the other from the colonizing European population.

The Dominion of Canada was established by the British Parliament as a confederated union in 1867. One consequence of this establishment is that "legislative control of heritage properties. . .is exerted mainly at the provincial and municipal levels, not at the federal level" (Stubbs and Makaš 2011: 485). In recent times, this has been achieved through a sequence beginning with some sort of commission, ministry founding/assessment, or report at the federal level that recommends legislative action at the provincial level. As became true in the USA, the impetus for Canadian heritage legislation grew from local historical societies and similar organizations, after which it became institutionalized as part of government agency mission. Thus, Manitoba established a historical society in 1870, and the Imperial Order of the Daughters of the Empire was established in 1895 to record

the history of European settlement along the St. Lawrence River. The Royal Society established a Committee for the Preservation of Scenic and Historic Places in Canada in 1901, and the Historic Landmarks Association was formed in 1907 (renamed the Canadian Historical Society in 1922). In 1922, Quebec passed Canada's first conservation act protecting cultural properties.

In 1951, the Royal Commission on National Development in the Arts, Letters, and Sciences called for legislation enhancing the protection of heritage properties and doing so in a way similar to that established in Great Britain and France (Great Britain, e.g., reworked its 1882 legislation in 1949 with the *National Parks and Access to the Countryside Act*). This resulted at the federal level in the *Historic Sites and Monuments Act* of 1953, which was aimed at federally owned properties. The action followed the 1951 report at the provincial level as well: Quebec rewrote its 1922 legislation in 1952, while New Brunswick passed its *Historic Sites Protection Act* in 1954. Other provinces followed suit until legislation was in place in all by the early 1970s (Stubbs and Makaš 2011: 489, 493).

The introduction of heritage legislation in the USA was different. Unlike in Canada, where the pre-European remains encountered by Europeans starting in the fifteenth century were seen to be the products of the native peoples – referred to as "First Nation Peoples" – in the USA, it was long felt that much of the prehistoric remains and certainly the extensive array of earthworks and mounds across the eastern half of the country were left from the Ten Lost Tribes of Israel, the Jewish population mentioned in Christian and Jewish scriptures that disappeared with the Babylonian conquest in 587 B.C. There were two inferences from this: (1) the archaeological remains associated with those earthworks and mounds were part of Judaic-Christian heritage and thus the arriving European's cultural patrimony and (2) the current native population – referred to almost always in current US federal regulations as "American Indians" – were late interlopers who displaced the descendants of the ten lost tribes. Not all agreed with that interpretation, and as a consequence, archaeology in the USA emerged in the early 1850s as a field bent on solving – one way or another – the "Mound Builder question." The Congress of the USA specifically set aside $5,000 per year for the Smithsonian Institution to resolve that question. As long as the possibility remained of the prehistoric Mound Builders having been descendants of the Ten Lost Tribes, the funding stipulation remained intact. When it was demonstrated in 1894 that those earthworks and mounds had been built by ancestors of American Indians, the funding requirement was withdrawn.

As in Europe, the early nineteenth century was a time in the USA of emerging scientific and anthropological societies, with an ethnological society established in 1842 and the Smithsonian Institution established by Congress in 1846. In 1853, the Mount Vernon Ladies' Association of the Union, a society made up of the upper social stratum, purchased the property and buildings of George Washington's estate as part of an effort to preserve it. This action is viewed as critical in establishing the heritage preservation movement in the USA (Hosmer 1981: 184–185, 525–527; Neumann and Sanford 2010: 7; Stubbs and Makaš 2011: 430–431).

The Mount Vernon Ladies' Association established upper-class societal approval and reflected emerging values that would lead to common-law legislation for protection of heritage properties. In 1876, the courts ruled to protect from demolition the Independence Hall, the structure in Philadelphia, USA, where the American Declaration of Independence had been signed. In 1896, the US Supreme Court ruled constitutional the use of federal funds to purchase private property to protect public interest, in this case part of the Gettysburg Battlefield in South Central Pennsylvania.

Reflecting the emerging feeling that there was heritage of sorts worth protecting, the US Congress passed legislation in the 1880s protecting some Revolutionary War (the War of Independence from Great Britain) battlefields. In 1889, specific legislation was enacted aimed at protecting Casa Grande, a prehistoric Classic Hohokam ruin in Southern Arizona.

It was not until 1906 that the comprehensive *Antiquities Act* was passed, which provided for the protection of historic or prehistoric remains, "or any object of antiquity," on federal lands. Further, it established regulations and sanctions regarding disturbance or damage of those remains. The next major package of legislation was the *Historic Sites Act* of 1935. This, in essence, was the first attempt to join together, under one statute, a federal policy that would encompass the decisions regarding historic structures, battlefields, and antiquities. It went beyond the *Antiquities Act* of 1906, although it was restricted to historic resources of national importance.

After World War II, there were a few governmental and legislative actions dealing with specific situations of heritage protection: the establishment of the National Science Foundation in 1950 (the first two awards for anthropology were for archaeological research in the Yucatán Peninsula of Mexico and the Zagros Mountains of Iran, not the USA); the Interagency Archaeological Survey, established in 1946 that would do salvage (rescue) archaeology along the Missouri River; the *Federal Aid Highway Act* of 1956; and the *Reservoir Salvage Act* of 1960. The last two acts prescribed archaeological salvage on a national level as a mitigative effort in the face of the loss of cultural properties from pending construction enabled by the federal government.

All of US heritage legislation was consolidated and focused in 1966 in the *National Historic Preservation Act* (NHPA), the single most important legislative act in the nation's historic preservation history and one that serves as a model worldwide. NHPA, particularly in what was originally its Section 106 (still commonly referred to as such, although US code now lists it as 54 USC 306108), in effect requires that, before any federally enabled – meaning federal funding, permit, or property somehow involved in whole or part – land alteration activity takes place, cultural properties that would be deemed eligible for listing on the nation's National Register of Historic Places must be identified. As that land alteration activity unfolds, such identified properties can be salvaged and recorded so that their continued existence is somewhat redundant from a recordation view, or those properties can be avoided through project redesign. This entire procedure is termed the "Section 106 Process." It is important to recognize that the nation's National Register of Historic Places is meant to serve only as a listing/inventory device to facilitate project planning; it does not confer protection on the heritage property. NHPA also became the single most important employer of archaeologists in the USA: Four out of every five archaeologists who work in positions in the USA that can only be held by an archaeologist do so as a result of NHPA (Neumann and Sanford 2010: 1–4, 25–26). Indeed, private-sector archaeology addressing the requirements of NHPA in the USA employs one out of every two anthropologists, working in positions that can only be held by an anthropologist, in the USA.

Six other acts were passed by the US Congress between the passage of the NHPA in 1966 and 1979, of which the *National Environmental Protection Act* (NEPA) of 1969 is the most important. It, too, requires cultural properties to be considered during federally enabled land alteration projects. NHPA, however, has regulatory precedence.

The NHPA applies only for federally enabled actions; many states have passed counterpart NHPA legislation, as have local governments, to address non-federally enabled situations. However, for completely private ventures involving private property, there is no heritage protection. Unlike in Middle and South America, Europe, the Mediterranean Basin, and China, the USA is not driven by a view of material remains representing a cultural patrimony that needs protection. Indeed, there is a thriving industry among the rural poor in locating and selling prehistoric and historic antiquities. While denounced by the professorate, professionals, and Indigenous communities, it is all perfectly legal provided public properties are not involved.

Middle and South America (Latin America)

The introduction of heritage legislation across Spanish America – which with the exception of Belize, Brazil, and some small European

territories is coterminous with Latin America/Middle and South America – begins with the tension that came from Spanish suppression and manipulation of the cultural heritage of the Indigenous peoples. Such legislation blossomed after independence from Spain, as the newly formed governments identified then sought to reaffirm their pre-colonial heritage. It should be noted that Latin American heritage legislation itself normally consists of a mixture of statutes and ministerial policies, depending upon the nation-state and the extent to which it contained extensive pre-Columbian populations and monumental architecture. It is also very important to note that those ministries often have, as part of their title, the Spanish or Portuguese cognate for "patrimony." As is the case with Greece, cultural property often is classified linguistically as synonymous with national identity and ownership. And since people think in and classify reality through their language, this is essential to understanding how important such heritage protection is viewed in those nations.

The conquest of Middle and South America began with Cortez's conquest of the Aztec Empire in 1513 and by Pizarro's of the vast Inca Empire in 1534. As mentioned earlier, by 1573, Phillip II had declared that all cultural properties under Spain's colonial dominion belonged to the Crown.

How the introduction of heritage legislation plays out among the various Spanish territories seems to follow how those territories were organized during the period of the Spanish Imperium, along with the heritage resources those territories contained (Fig. 2). For administrative reasons, Spain eventually divided its possessions into four sets: the Viceroyalty of New Spain, which ran from what is now the Southwestern USA through Mexico into Central America (set out in 1528); the Viceroyalty of New Granada (set out in 1739), which included some southern sections of Central America into what is now Panama, Colombia, Venezuela, and Ecuador; the Viceroyalty of Peru (declared in 1542), including mainly Peru; and the Viceroyalty of the Rio de la Plata (set out in 1776), which included Bolivia, Paraguay, Uruguay, Chile, and Argentina. While all of these areas were freed from Spain within 15 years of each other in the early 1800s, their subsequent emplacements of heritage legislation vary, in the main because of the differences in the ruling philosophies of the viceroys combined with major differences in their pre-Columbian heritages (Fig. 2).

The first major changes in Spanish control came with the independence from the Spanish rule of Argentina in 1816; of Chile and Paraguay in 1818; of Mexico and the Central America republics (except Panama, which was part of Colombia until 1903, and Belize, which became independent of Great Britain in 1981) in 1821; of Peru, in a sequence running from 1821 to 1824; of Bolivia in 1825; of Uruguay in 1828; and Ecuador, Colombia, and Venezuela, first together as Gran Colombia in 1821 and then each separately by 1830 (Brazil was a Portuguese possession, with independence coming in 1822). Mexico, Guatemala, El Salvador, Belize, and Honduras in Middle and Central America and Colombia, Ecuador, Peru, Bolivia, and Chile in South America are particularly rich in pre-Columbian antiquities that have long been sought internationally, be it as part of research efforts or simply as plunder. The emplacement of heritage legislation historically has had protection of those materials in mind.

Mexico serves as an extreme example of how the territories of New Spain sorted out protection of their heritage after independence. Mexico acted quickly banning the export of antiquities while establishing a national museum in 1826, an action reflecting the international feelings of the time and closely matching what was taking place in Greece during its independence movement. In 1864, during a brief time when Mexico was a monarchy, Maximilian I banned all excavations in the Yucatán. Legislation passed in 1868 declared that all Mexican archaeological sites and associated antiquities were the property of the state, further requiring that the state was to protect and preserve those properties. A governmental archaeological institution – Inspección de Monumentos Arqueológicos (IMA) – was established in 1885 and was charged with documenting archaeological sites, making heritage preservation an institutionalized government

Heritage Legislation, The Introduction of: Disciplining Through Law, Fig. 2 Emergence of Heritage Legislation in Latin America

policy. That policy along with earlier laws establishing state control was enhanced in 1897 by legislation criminalizing the destruction of archaeological sites, restricting the export of cultural materials without federal permit and requiring that all recovered archaeological objects be housed in the National Museum. Heretofore, the laws enacted were aimed mainly at protecting the pre-Columbian heritage. However, legislation was passed in 1914 protecting the colonial heritage. By 1916, the IMA had been incorporated into the National Museum.

In 1934, Mexico enacted the *Law for Protection and Conservation of Archaeological and Historical Monuments, Typical Towns, and Natural Beauty Sites*, a law based upon the 1931 Athens Charter for the Restoration of Historic Monuments (adopted by the International Congress of Architects and Technicians of Historic Monuments). In 1939, INAH (Instituto Nacional de Anthropología e Historia) was established, becoming the government agency tasked with, among other things, explicating and preserving Mexico's cultural heritage. In 1972, a new federal law, the *Law of Monuments, Archaeological, Artistic, and Historic Zones* was passed, again reinforcing state ownership of cultural properties while also expanding restrictions on the marketing and export of antiquities and other items of cultural heritage value. One aspect of this law of interest was the inclusion of the following statement: "all documents of local and federal offices and all books and printed materials in Mexico from the same period [from the 16th through the 19th centuries]. . .are worthy of inclusion [as protected cultural properties] due to their importance or rarity" (Stubbs and Makaš 2011: 514). This law identified and also protected the kinds of classical documents that the Abbasid Caliphate in Baghdad and Umayyads in Spain had obtained in the eighth century, along with the various sacred texts removed from South Asia to Europe in the seventeenth to nineteenth centuries.

Introduction of heritage legislation in the remaining nation-states of what had been New Spain followed a similar pattern, although not always as quickly, comprehensively, or patrimonially. For example, Guatemala, which became independent at the same time as Mexico, has also sought the same kind of state-level control over its cultural heritage, Costa Rica, less so. Costa Rica did not establish its Museo Nacional until 1887, Guatemala, not until 1898. Generally, though, all of the nation-states viewed the pre-Columbian remains especially as part of their patrimony and historically have endeavored, at least on paper, to prevent those remains from being taken out of the country.

Honduras began government actions for protecting heritage properties even before becoming a separate, independent nation-state with the dissolution of the United Provinces of Central America in 1838. Action was taken in 1836 to protect the prehistoric Mayan site of Copán after archaeologist John Lloyd Stephens purchased it, a purchase Honduras later revoked. Heritage action at the legislative level did not resume until the turn of the last century, in a sense following from the activities going on in Europe in the late 1800s (Fig. 2). By 1900, Honduras had enacted a national heritage law, although this was mainly aimed at pre-Columbian antiquities. El Salvador did this in 1903, enacting laws to restrict the export of antiquities. And that is how things remained until after World War I.

During the inter-War years, as in Europe, efforts were made to consolidate and strengthen heritage legislation. In 1935, for example, Honduras enacted laws protecting historic sites, and that legislation was extended in 1940 to protect portable historic items. El Salvador passed a similar law in 1935, extending protection to portable objects in 1938. Costa Rica enacted its first laws to protect cultural properties – a law aimed mainly at archaeological excavations and limited removal from Costa Rica of artifacts recovered from sites – in 1938. However, for Guatemala, the various laws regarding its archaeological heritage would not be enacted until the 1940s.

After World War II, Guatemala's counterpart agency to Mexico's INAH – IDAEH (Instituto de Antroplogía e Historia) – was established in 1946; Honduras set up a similar agency – IHAH (Instituto Hondureño de Antroplogía e Historia) –

in 1952. Both were given authority over the respective nation's archaeological and historical heritage. The Costa Rican Constitution in 1949 declared that the government was to protect its cultural heritage. In 1955, Guatemala passed legislation declaring state ownership over its archaeological and historical patrimony while also prohibiting the export of antiquities and similar sorts of cultural property.

Six UNESCO conventions and recommendations were set forth between 1970 and 1978 (Table 1), the first being the C*onvention on the Means of Prohibiting and Preventing the Illicit Import, Export and Transfer of Ownership of Cultural Property (1970).* As happened in many parts of the world, the nation-states formerly of New Spain acted accordingly, with all eventually ratifying the 1970 Convention by 1996. This was further encouraged by the OAS (Organization of American States) 1976 *Convention on the Protection of Archaeological, Historical, and Artistic Heritage of the American Nations.* Known much more conveniently as the *Convention of San Salvador*, it was aimed primarily at illegal trade in antiquities, although it urged each signatory to pass heritage legislation.

Thus, between 1976 and 1984, most Guatemalan government heritage legislation came from ministry and agency procedures, where such government agencies were charged with protecting cultural property, be it archaeological or architectural. Some of this was done with the assistance of the OAS. Guatemala was the first Central American nation to sign the *Convention of El Salvador* in 1979, but it would not be until 1997 that it passed its *Law for the Protection of the Cultural Heritage of the Nation*. In 1983, Honduras also signed the *Convention of San Salvador* and in 1984 enacted its *Law for the Protection of the Nation's Cultural Heritage* (revised in 1997). The Law protected not only buildings, archaeological sites, and artifacts, but it also protected manuscripts while vesting authority over all of this in IHAH (Instituto Hondureño de Anthropología e Historia), which itself had been established in 1952.

Costa Rica signed the *Convention of San Salvador* in 1980; it enacted its *Law for the Conservation of the National Archaeological Heritage* in 1982. This was augmented in 1995 by the *Law for the Historic and Architectural Heritage* of Costa Rica which not only protected sites, pre-Columbian and historic, but also prescribed fines for damage to such properties. The 1995 Law also shifted protection of privately held cultural properties from the state to the owners, offering tax incentives and other enticements for preservation.

Across the former Viceroyalties of New Granada, Peru, and Rio de la Plata, the introduction of heritage legislation was not as detailed or organized as it has been to the north, generally because many of the nation-states have a history of government instability. This has resulted in periods of government interest in promoting heritage legislation or the equivalent ministerial policies and periods when such were not promoted. Stubbs and Makaš's (2011: 620) remark that Ecuador's "cultural resource policy and its enforcement has been. . .somewhat erratic during the past century" can been seen as an apt description for all of the nation-states formed out of those earlier Viceroyalties.

Ecuador itself is a case in point, where the first cultural heritage legislation was not passed until 1945, but it was not until 1978 that the INPC (Instituto Nacional de Patrimonio) was established to protect and promote the country's cultural heritage. The same holds for Venezuela, where heritage preservation measures were initiated in the town of Coro (founded in 1593, it was listed as a World Heritage site in 1993 because of its architecture) as early as the eighteenth century, and has been intermittently preserved through the subsequent centuries, but only to have UNESCO place it on its List of World Heritage in Danger in 2005. Like Ecuador, Venezuela's first legislation – the *Protection and Conservation of Antiquities and Artistic Works Act* – also was enacted in 1945 to protect the nation's cultural heritage. That Law was updated in 1993 with the *Law for the Protection and Defense of the Cultural Heritage*.

Concern in Columbia over pre-Columbian heritage was exhibited in 1761 when construction of a church over a pre-Columbian structure was

prohibited. However, excepting for establishment of a national museum in 1827 and formation of a Commission of Cartography – tasked with, among other things, documenting archaeological sites and similar heritage properties – in 1850, it was not until 1920 that comprehensive legal measures were taken to protect cultural properties from theft and export. In 1934, Columbia adopted the Roerich Pact (see below) as part of its constitution, which would render all heritage properties neutral during times of war. The Pact also was seen to provide clearer definitions of cultural properties than had Columbia's 1920 Law.

After World War II, Columbia refined and updated legislation in 1959 to specifically include archaeological sites and architecture and also to allow the state to expropriate archaeological sites if needed for their protection. The new law also established the Consejo Nacional de Monumentos, which was charged both with registering private property deemed of national importance and stopping the illegal export of cultural property. The responsibilities of the Consejo were shifted to the Instituto Colombiano de Cultura between 1968 and 1997. Colombia enacted a new constitution in 1991, which in part indicated that the state was responsible for protecting the nation's cultural heritage. As a result, the *General Law on Culture* was passed in 1997, replacing the Instituto Colombiano de Cultura with the Dirección de Patrimonio, which deals with heritage protection, conservation, and promotion of Colombia's heritage.

Peru set forth in its 1852 Civil Code that archaeological finds belong to the discoverers as well as to the owners of private property. This statute, so different from the patrimony laws found elsewhere in Latin America, was changed in 1929 by the *Law for the Protection of Archaeological Monuments* which declared state ownership of portable and immobile cultural property, restricted export of such properties, and required registration of "objects of value" be they in public or private ownership. The law was not retroactive; it only applied from 1929 forward (or backward, as Quechua phrases it, since one walks backward through time). While the 1929 law protected historic artifacts, it did not do so for historic structures; those were added in 1939, with registration of historic artifacts further added in 1958. In 1971, following the 1970 UNESCO convention, Peru established its INC (Instituto Nacional de Cultura), a government agency charged with protecting the country's cultural heritage. In 2004, Peru again updated its heritage legislation, reaffirming state ownership of all cultural heritage sites and objects, unless the INC declared the item of little value.

Bolivia followed a pattern more in line with Peru than with other nation-states of the old Viceroyalty of Rio de la Plata, in part because it contained extensive pre-Columbian remains. Heritage legislation in Bolivia has been, like Peru, both statutory and ministerial. Following independence in 1825, Bolivia issued a Supreme Decree calling for the preservation of historic – post-Columbian – buildings for educational purposes. In 1906, a number of the more significant archaeological sites were declared property of the state, and in 1927 the new *National Monuments Act* set in place more comprehensive heritage policies while also initiating a historical sites registration program. Beginning in 1961, a series of Supreme Decrees and Ministerial Resolutions refined the 1927 Law by clarifying what cultural properties were protected and the legal procedures to be used.

Bolivia established its IBC (Instituto Boliviano de Cultura) in 1975 which was concerned mainly with documenting and conserving the architectural and artistic heritage of the nation. It was replaced in 1993 with the National Secretary of Culture that, itself, was in 1997 restructured into the current VDC (Viceministerio de Desarrollo de las Culturas). The VDC is responsible for policies regarding cultural properties, compliance with international agreements, and dealing with illicit trafficking in antiquities and similar cultural properties.

Chile, like Bolivia, also has extensive pre-Columbian remains, although not as spectacular as Peru or Bolivia. Thus, Chile was late in developing heritage protection. In 1925, it established its Council of National Monuments (Consejo de Monumentos Nacionales), but due to internal Chilean politics, it was irregular in protective

actions. It was not until 1970 with the *Law 17.288 of National Monuments* that heritage properties to be protected were defined and categorized. The Consejo was reorganized first in the later 1970s and again in 1994. One element that had contributed to heritage protection in Chile was the requirement starting in the 1990s of environmental impact reviews prior to construction, serving in part to identify and salvage archaeological materials.

The remaining nation-states of the old Viceroyalty of Rio de La Plata had far less in the way of pre-Columbian populations and prehistoric wealth. Heritage legislation in the region has been more in the direction of historic remains and, excepting action by Argentina in 1913 protecting archaeological sites, did not emerge until well into the twentieth century (Fig. 2). As elsewhere in Latin America, much of the heritage protection has come from establishing government agencies that were then charged with developing some level of heritage protection. Argentina, for example, established its Comisión Nacional de Museos y Monumentos y Lugares Históricos in 1940, which was responsible for everything from designating to regulating the export of heritage properties. Uruguay established a similar government commission treating historic sites in 1950 but did not pass heritage legislation until the early 1970s which, in turn, reorganized the earlier Commission into the current Comisión del Patrimonio Histórico, Artistico y Cultural de la Nación. That Commission was reorganized in 1997 with the authority over archaeological excavations, rehabilitation, and the export of heritage properties.

Paraguay did not establish heritage legislation until 1982 with the creation of the General Directorate for Cultural Heritage (Dirección General de Patrimonio Histórico Cultural), which was mainly concerned with identifying heritage properties and overseeing restoration. A new constitution was set out in 1992, which specified the government's responsibility for protecting the nation's cultural heritage. This would be done not only by protecting what was present within Paraguay but also by locating and, if possible, buying back items that had left the country.

The introduction of heritage legislation in Brazil was different than that which had occurred in Spanish America, reflecting both the Portuguese roots of Brazilian colonization and the absence of Indigenous civilizations with monumental architecture, large populations, and great wealth (Fig. 2). European settlement began along the coast in the early 1500s, and the economy developed by 1700 into one of large sugar plantations enabled by native and African slaves. In 1808, the Portuguese royal family took refuge in Brazil from Napoleon; in 1822 and with the return of the royal family to Portugal, a son engineered an independence movement such that the Empire of Brazil was established, which lasted until 1889. Throughout that royal/imperial time from 1808 to 1889, there not only was extensive construction in a European style, but there was a concern by that royal class for the built environment (Fig. 2). The humid tropical climate necessitated continual conservation measures, and that need resulted in early and ongoing efforts at heritage preservation, mainly focused on architecture and related elements. Thus, the earliest protection program was in 1742 with the Palacio das duas Torres in what is now Recife, representing a pattern into the nineteenth century of a concern by the governing royal classes for the protection of key buildings, sites, and even inscriptions.

The period from 1889 forward was politically unsettled, and so too was any effort to protect the nation's cultural property and associated heritage. For example, in 1920, the Sociedade Brasileira de Belas Artes introduced legislation to protect cultural properties in Brazil, but the legislation did not pass. Efforts to pass such acts continued into the 1930s, and the concern for heritage protection worked its way into the 1934 constitution. A constitutional decree – Protection of Cultural Heritage – and the establishment of IPHAN (Instituto do Patrimônio Histórico e Artístico Nacional) occurred in 1937. The decree called for the registering of heritage sites and, for the built environment, the obtaining of government permission before anything was altered. The decree also classified the types of cultural properties, which included historical and prehistoric sites along with portable objects. IPHAN was

empowered in 1940 to acquire properties if needed to protect them. IPHAN remains the core agency attending to Brazil's heritage, such that its policies are effectively the country's heritage legislation. In recent times, it has followed UNESCO conventions in how to address heritage protection.

Asia

The introduction of heritage legislation across Asia varied according to the cultural values of the given area. In India, the idea of heritage was readily acceptable in part because of a long-standing acceptance of the past, which included a cosmology that had the world 4 billion years old. Thus, when India found unification under the British, the incorporation of a British sense of antiquity and antiquity laws was comparatively uneventful. That incorporation was also found in other British territories, such as present-day Pakistan, Burma, Malaysia, and the nation-states along the north coast of Borneo (the remainder of Borneo along with most of the rest of the Indonesian archipelago constitutes modern Indonesia – formerly the Dutch East Indies, Indonesia gained independence from the Netherlands in 1945). In China, heritage legislation came from a vision of a culturally unified people present in one geographic area for a very long time. This to some extent is true for Japan as well, although the impetus for heritage legislation postdates European penetration in the Japanese market, with most of the legislation itself emplaced after World War II. The cultural properties within those areas represented the peoples who, given the cosmology and structure of rule, represented the mandates of the imperial households themselves.

Other nation-states across Asia – Burma, Thailand, and Cambodia, the three kingdoms that currently are coalesced as Vietnam, among others – all had a sense of a cultural past, but it would not be until the various UNESCO conventions that each would start attending to their own cultural properties and the heritages represented by them. Each has done so in a way concordant with its own cultural values.

For South Asia: India has always had an awareness of its own antiquity, but the extent of that antiquity and how it related to the broader world – especially that of Europe – were not fully apparent until the eighteenth century. As in Latin America, it was the heritage content of South Asia, combined with the desire of other parts of the world to possess pieces of that heritage, which precipitated India's current heritage legislation.

Just as Spain controlled so much of Middle and South America, so too did Great Britain of India. British rule was incrementally established beginning in 1757, continued with the acquiescence of the Mughal Emperor to the British in 1803, and was completed with the placement of the princely states under British tutelage in 1858. During those 200 years, Great Britain enacted the *Regulating Act* of 1773 and the *India Act* of 1784, which together placed the Indian possessions firmly under British parliamentary control and, thus, physical control. Coincident with that control was the realization in the late 1700s not only of the antiquity of Sanskrit and its relationship to Latin and Greek – and thus its value for understanding European culture history – but the realization that that philological history was contained within India's sacred texts. By 1822, religious texts were being acquired and then sent back to England as part of those philological studies.

There had been an awareness of the value of historic Indian – mainly Vedic – texts and similar literary items since the seventeenth century, mainly as a consequence of Jesuit research. However, with the growing interest in Western Europe in philology, stimulated by the discovery of the Rosetta Stone in Egypt; the finding of the relationship of cuneiform writing to Sanskrit; and the general investigation not just of languages but of how languages as geographically disparate as Latin, Greek, and Sanskrit could all share a common ancestor (and eventually casting doubt on the idea that Hebrew was the original human language, a premise in the Judeo-Christian Europe/Mediterranean Basin), India's cultural property in the form of manuscripts and similar documents was suddenly of great value to Northern European scholars. Indeed, it was seen in the early nineteenth century and mid-nineteenth century that it was from India particularly that the origins of language and religion emerged, an enormous paradigm shift. Remember, the central

intellectual issue in Europe by the second half of the nineteenth century was how modern humans had come to be as they are; that issue drove nearly all archaeological heritage-related research and underlay much of the desire to acquire evidence documenting the origins of such things as language.

This removal of ancient texts (and other items) from the subcontinent is a history of which modern India is very aware, and it influenced how the country approached its cultural heritage and heritage legislation when it became independent in 1947. India as part of its independence from Great Britain in 1947 embodied in its Constitution Article 49, which states that "[i]t shall be the obligation of the State to protect every monument or place or object of artistic or historic interest, declared by or under the law made by Parliament to be of national importance, from spoliation, disfigurement, destruction, removal, disposal or export, as the case may be," while Article 59A makes preservation of Indian's "composite culture" the duty of every citizen (Pachauri 2006: 236). From this came the 1947 *India Antiquities (Export Control) Act*, which in 1972 was augmented by the *Antiquity and Art Treasures Act* (coincidentally when the UNESCO 1972 World Heritage Convention came out). India's heritage is protected mainly through the Archaeological Survey of India.

Government-level policies regarding cultural properties across eastern Asia are known mainly from China and Japan. The People's Republic of China (PRC) has a long and established cultural tradition of collecting relics, a practice common before the Revolution among intellectuals and the elite and a practice that continues today among many (Anonymous 2000). In imperial China, cultural properties – the cultural heritage that heritage legislation is now meant to protect – were seen to be a product of the people's cultural past.

Formal archaeological work began during the reign of Huizong [b. A.D.1082, reigned A.D. 1101–1125, d. A.D. 1135]. Huizong was a collector, and his fascination with the past "fostered a fashion in antiquities" (Watson 2005: 315). This appears to have been part of the zeitgeist for the time, with the Chinese Southern Song Dynasty (A.D. 1127–1279) conducting archaeological research as an exercise in state identity (Paludan 1998: 138). All of this was built on a legacy of formal historical research and classification of known antiquities/relics, such as Lu Dalin's *Archaeological Plates* published in A.D. 1092 and Sima Guang's vast *Complete Mirror of the Illustration of Government*, published between A.D. 1072 and 1084 (Watson 2005: 314). Those who could afford to do so collected what would now be termed "cultural property": Relics, be they items from under the ground, books, antiques, or architectural elements.

China does not have a cultural history of legislative rule of law, certainly not in the sense of the Roman legal system that gave rise to Western constitutional law. True, from the late 1800s to 1949, China was influenced by Western legal systems, but from the end of the Revolution until the Open Door Policy of 1978, that approach was abandoned by the PRC in favor of a patchwork of rules and regulations meant to protect cultural heritage. Guidelines on the export as well as the preservation of relics were issued in 1960, 1961, and 1967. After 1978, there was a conscious effort to establish a national legal system, which came to include consolidation and coordination of heritage legislation. The National People's Congress adopted the *Law of the People's Republic of China for the Protection of Cultural Relics* in 1982 (revised 1991, 2002, 2007), while the State Council approved regulations protecting underwater cultural property in 1989, administration of archaeological excavations done by foreigners in 1990, and an overall *Rules for the Implementation of the Law of Protection* in 1992 (revised 2005). The PRC is proactive in the protection of those cultural relics: Article 45 sets out substantial fines, including those due to damage during construction (up to 1% of the project costs). The PRC is a signatory on the UNESCO 1970 and 1972 Conventions; heritage protection proceeds from those.

Heritage legislation in Japan can be seen to start with the 1871 *Edict for the Preservation of Antiquities*, set out by the Council of State, soon augmented by the 1879 Ministry of the Interior's

Proposition to Preserve Shrines, Temples, and Their Treasures Forever. This was followed by enacting of the Koshaji-hozon-ho (*Law for the Preservation of Ancient Shrines and Temples*) in 1897 (Liebs 1998: 680). This was supplemented by Siseki-Meisho-Ten'nenkinenmutsu-hozon-ho [*Law for the Preservation of Historic Sites, Places of Scenic Beauty and Natural Monuments*] (1919), Kokuho-hozon-ho [*Law for the Preservation of National Treasures*] (1929 amendment to the 1897 law), and Juyo-bijutsuhin-to-no-hozon-ni-kansum-horitsu [*Law for the Preservation of Important Art Objects*] (1933).

Post-World War II Japanese heritage legislation starts with the 1950 Bunkazai-hogo-ho [*Law on the Protection of Cultural Properties (Act No. 214)*], which has been amended as recently as 2007 (*Act No. 7*). The *Law on the Protection of Cultural Properties*, both the original and subsequent modifications, has resulted in separate provisions "for protection of structures, designed and natural landscapes, archaeological sites, traditional crafts and skills, and even living people who could be designated as living national treasures" (Liebs 1998: 680).

Oceania

Heritage legislation across Oceania comes as much from legislation derived from or inspired by earlier colonial or protecting powers as it does from autochthonous development or using UNESCO conventions as a model. The USA and Great Britain have had the greatest influence across the region, with the latter's impact coming as much through the Commonwealth of Nations as through current or past territorial administration.

There are also regional agreements. The *Model Law for the Protection of Traditional Knowledge and Expressions of Culture Act* of 2002 is one such Pacific Basin regional instrument, although it is geared more to traditional cultural knowledge as it pertains to the given people's ecological setting. The *Model La*w was developed at a joint conference of the South Pacific Commission ("SPC"), the Pacific Island Forum Secretariat, and UNESCO and then endorsed at the First Conference of Ministers of Culture of the Pacific Region in 2002. The *Model Law* includes among its aims the protection of traditional knowledge and expressions of culture.

The Commonwealth of Nations (former British Commonwealth) in Oceania includes Australia, Papua New Guinea, New Zealand, Samoa, the Solomon Islands, Tonga, Vanuatu, Nauru, and Kiribati. All members of the Commonwealth of Nations are signatories to the *Commonwealth of Nation's Environmental Protection and Biodiversity Conservation Act* of 1999 (EPBC Act); national heritage is one of eight matters of national environmental significance protected by the EPBC Act. The predisposition for all of this, though, would have come out of Great Britain's 1882 *Ancient Monuments Protection Act.*

In addition, and a bit confusing, Australia's national law is also entitled *Environmental Protection and Biodiversity Conservation Act* of 1999 (EPBC Act). The EPBC Act lists eight categories of concern, of which two – world heritage properties and national heritage places – would include cultural properties of the kind under consideration here. The EPBC declares that any action that could affect such properties must first receive government approval, a decision made by the Minister for the Environment, Heritage, and Arts.

Nationally, Australia also has its *Historic Shipwrecks Act* of 1976, which protects shipwrecks over 75 years of age in Commonwealth waters. It also has the *Protection of Moveable Cultural Heritage Act* of 1986, which protects portable cultural properties from export. The list of "moveable cultural heritage of Australia," detailed in Part II, Division 1.7, consists of "objects that are of importance to Australia, or to a particular part of Australia, for ethnological, archaeological, historical, literary, artistic, scientific or technological reasons." However, like Canada, a lot of legislative initiative has been vested in sub-national administrative jurisdictions, which in Australia are called either "states" or "territories." Each of the states along with the Northern Territory and the ACT (Australian Capital Territory) has counterpart legislation, administered by heritage councils and branches, along with the Departments of Aboriginal Affairs or equivalents. Australia, in particular, has established extensive heritage legislative protocols, to the point where it, like the

USA and South Africa, has an extensive private-sector archaeological industry that helps clients stay in compliance with the heritage legislation.

The introduction of heritage legislation to New Zealand – in addition to that prescribed by Great Britain's by the *Ancient Monuments Protection Act* of 1882 – can be seen to start with the *Kapiti Island Public Reserve Act* of 1897, which broadly protected cultural properties. The 1928 *Canterbury Provincial Buildings Act* too was a heritage protection act. And thus after 1928 came a series of acts addressing heritage matters in New Zealand, somewhat focused in intent before World War II when there still was provincial sway, but more encompassing on a national level after New Zealand became a Commonwealth realm in 1947. A signatory to the UNESCO 1972 *Convention Concerning the Protection of the World Cultural and Natural Heritage* (World Heritage Convention), New Zealand followed soon after with a series of acts aimed in whole or part at protecting its cultural heritage.

For New Zealand, the 1975 Treaty of Waitangi (or *Treaty of Waitangi Act*) grew out of the Maori protest movement against non-Maori cultural dominance, establishing cultural rights to lands and subsistence practices. The Treaty's wording with respect to heritage properties is at best vague but was interpreted in keeping with the intent of protecting heritage properties and thus in the spirit of early 1970s to mid-1970s UNESCO cultural heritage protection. Soon after the Treaty of Waitangi came the *Reserves Act* of 1977. In addition to the protection of habitat along with flora and fauna, the *Reserves Act* provided for the preservation and management of "historic, cultural, [and] archaeological" features. This was complemented by the *Local Government Act* of 1977, which enables local authorities to protect archaeological sites, historic buildings, and similar cultural properties (as well as wildlife habitats and similar).

All of this set the stage for the *Conservation Act* of 1987. While the *Conservation Act* of 1987 was aimed mainly at noncultural properties, it did include in Section 2 "protection of. . .historic resources for the purpose of maintaining their intrinsic values. . .." However, the core legislation consists of the *Resource Management Act* (RMA) of 1991, which identified the preservation and protection of cultural properties as a matter of national importance and provided funding for such (protection funded through a national Heritage Lottery), and the *Historic Places Act* of 1993. The RMA of 1991 replaced the *Town and Country Planning Act* of 1977.

Sub-Saharan Africa

African nation-states contained within the Mediterranean Basin were considered above. Introduction of heritage legislation across the remainder of the continent found inspiration in at least one of three sources: (1) legislation developed by former colonial powers, which overlaps with (2) participation in the Commonwealth of Nations (formerly the British Commonwealth) or (3) UNESCO conventions implemented on a national level. Most heritage legislation in sub-Saharan Africa dates from after 1960. However, some nation-states do not have formal heritage legislation.

There is a disconnect between the cultural proscriptions on disturbing heritage sites – archaeological sites, graves, and cultural landscapes by whatever definition – on the one hand and the kind of legislation structured within UNESCO or its coincidents in Western legislative tradition on the other. Ndoro et al. (2009: 5), who see much of cultural heritage legislation as being distorted through the non-sub-Saharan African linguistic lens of temporal structure and material heritage, explained:

> In most areas of Africa, traditional regulatory mechanisms and practices have existed down through the ages of the protection of heritage places such as sacred groves, streams, rivers, shrines, temples, tombs, palaces, and mausoleums. These comprise prescriptive taboos, avoidances, and practices put in place by local communities and constitute customary laws and traditions which can be regarded as unwritten constitutions and laws passed on from one generation to the next.
>
> This prejudice, particularly for objects defined somehow as 'ancient,' is shown by the predilection of heritage laws being titled 'Historical Monuments, Relics, and Antiquities Act' or similar. (Ndoro et al. 2009: 25)

Roughly half of the sub-Saharan nation-states are members of the Commonwealth of Nations. Some were originally British colonies/territories by 1900: Sierra Leone, the Gambia, Ghana, Nigeria, South Africa, Botswana, Zimbabwe, Uganda, Kenya, Zambia, and Somalia. Some were essentially protectorates or applied for and were granted admission in the Commonwealth: what is now Tanzania (formerly German), Mozambique (formerly Portuguese), Rwanda (formerly Belgian), and Cameroon (formerly French). Each became independent between 1957 and 1965. Excepting Zimbabwe, which was suspended in 2002 and then withdrew in 2003, and the Gambia, which withdrew in 2013 but applied for readmission in 2017, all remain active members of the Commonwealth. All are signatories of *Environment Protection and Biodiversity Conservation Act* of 1999 (EPBC Act). The EPBC Act established the Commonwealth Heritage List, which comprises natural, indigenous, and historic heritage places within a Commonwealth area.

For example, in South Africa: the Republic of South Africa (RSA) became independent of Great Britain in 1961. The *National Monuments Act* of 1969, which in addition to clearly archaeological properties protected paleontological (which would include hominin-related) as well as mineralogical properties. The *Environment Conservation Act* of 1989 and the *Minerals Act* of 1991 enhanced heritage protection, although they were not aimed directly at that area; the *Environmental Conservation Act* was updated with the *Environmental Management Act* of 1998. Major heritage legislation came about with the *National Heritage Resources Act* (NHRA) of 1999. The NHRA established the South African Heritage Resources Agency, which is responsible for the protection of national heritage resources, controlling export and illegal import of cultural properties, and assisting provinces in managing their heritage resources. The NHRA protects archaeological and paleontological sites, burial grounds, and grave sites; these may not be disturbed, in any way at all, without a permit from the relevant heritage resources authority.

The legislation means that developers and people managing land that contains cultural heritage must employ qualified professionals to identify and mitigate harm to such sites. This requirement has resulted, as in the USA and Australia, in a professional archaeological sector, represented by the ASAPA (Association of Southern African Archaeologists), dominated by private-sector archaeologists. As in the USA, the heritage archaeological work in response to statutory mandates is known as "cultural resources management."

The only sub-Saharan nation-state that does not quite follow all of this is Sudan, now divided between north and south. Sudan was part of the Anglo-Egyptian Sudan, a dominion under joint French and British governance within the Ottoman Empire. However, it is from that heritage that Sudan – before its split between North and South in 2011 – had in place its *Antiquities Act* of 1952, protecting all human-associated objects from 1821 and before and all non-human fauna objects from before A.D. 1340.

For the other former British territories, the sequence has not been as detailed nor as immediate. Initial post-independence heritage legislation included Uganda's 1967 *Historic Monuments Act* (protecting not just landscape and culturally valued properties but also archaeological sites in a wide variety of possibilities), incorporated in general into its Constitution in 1995, Malawi's 1965 *Monuments Act*, which is similar in nature to Uganda's Act. Ghana enacted its National Museums Regulation in 1973 but protected materials only from the period before the "gold rush" of 1900. Tanzania emplaced its *Antiquities Act* in 1964, protecting "relics, monuments, and protected objects."

The other 14 Southern African Development Community (SADC) countries – Angola, Botswana, the Democratic Republic of the Congo, Lesotho, Madagascar, Malawi, Mauritius, Mozambique, Namibia, Seychelles, Swaziland, Tanzania, Zambia, and Zimbabwe – have legislation equivalent to the NHRA that makes similar demands to protect their national heritage. Zimbabwe's *National Museums and Monuments Act* of 1972 is one such example. All

15 SADC nations are also signatories on the 2000 Blantyre Protocol on Cultural, Information, and Sport, which includes a broadly worded provision for the preservation of vaguely defined cultural heritage. That Protocol was guided by the OAU (Organization of African Unity) 1969 Cultural Charter for Africa (Cultural Manifesto of Algiers) as well as the 1980 OAU Lagos Plan of Action for the Economic Development of Africa and the Final Act of Lagos. None of these, though, are mainly for or restricted to heritage protection.

In addition, many of those nations passed heritage legislation soon after establishing independence. For example, Tanzania – which was a merger of Tanganyika and Zanzibar in 1964 – had in place *Tanganyika's National Museum Act* of 1963, Tanganyika becoming independent in 1961. Zimbabwe, which as Rhodesia separated from Great Britain in 1966, emplaced its *National Museum and Monument Act* in 1972, the wording of which is very similar to Kenya's 1983 *Antiquities and Monuments Act* and *National Museum Act* (Kenya's 1983 law was updated with the 2006 *National Museums and Heritage Act*). That similarity may be due to a shared heritage as British territories.

Zambia, too, after World War II had several heritage-related government notices protecting specific heritage properties, ranging from prehistoric rock art and quarries in 1950 and 1952 to protection of the Kabwe Big Tree in 1955 (the tree from which the World War I East African Campaign departed in 1914). Zambia's *National Heritage Conservation Commission Act* of 1989 consolidated the earlier specific protective actions. Zambia passed its *National Heritage Conservation Commission Act* in 1994, which established a Commission for the Preservation of Natural and Historical Monuments and Relics. The Act relegates to the Commission the responsibility for heritage protection such that permits are required from the Commission for archaeological excavations at any heritage site or for the collecting of relics. Further, the Act gives the Commission the right to purchase any privately held relic.

Introduction of Global Heritage Legislation

Global and Regional Actions

All regional and global initiatives for heritage legislation began either in Europe/Mediterranean Basin or were developed and then promulgated from their cultural heirs, such as the USA and nation-states in Spanish America (Figs. 1 and 2; Table 1). The Hague Conventions were European in origin; the League of Nations and then the United Nations, of which UNESCO is a part, were – excepting China as a founding member – US and European in origin.

The immediate precursors for global heritage legislation were the *Hague Convention* of 1899 and of 1907, both of which were concerned primarily with the conduct of war and were aimed at nation-states regardless of where they were located on the planet. Articles 46, 47, 55, and 56 of the *Annex to the Convention of Hague II*, 1899, specifically protected private property, equated art and scientific property as private property, prohibited pillage, and required that all public property and lands to only be administered – not used – by occupying powers. The same articles were repeated with essentially the same content in the *Annex to the Convention of Hague IV*, 1907, but with the expansion of Article 56 to explicitly protect cultural properties, both fixed and portable.

The spirit of the heritage protection element of the Hague Conventions was embodied in the so-called Roerich Pact, a document drafted in 1929 by artist Nicholas Roerich along with George Chklaver. The basic idea of the Pact was that the protection of cultural properties during times of war was more important than military needs. The Pact eventually became the Treaty on Protection of Artistic and Scientific Institutions and Historic Monuments, which was approved in 1933 at the seventh International Conference of American States and signed by those nation-states in 1935.

In 1931, the First International Congress of Architects and Technicians of Historic Monuments passed "The Athens Charter for the Restoration of Historic Monuments." It embodied much of the heritage preservation

concerns of the inter-War period and is significant here for three reasons: (1) Resolution 4 calling for the reburial of excavated sites that cannot be adequately protected; (2) Resolution 6 calling for custodial protection of historical sites (which would include archaeological sites); and (3) Conclusion II recognizing the right of private ownership. This last point is of interest since some nation-states – for example, Mexico and Greece – view antiquities as being part of the nation's patrimony and thus rightly property of the state.

In 1976 the Organization of American States (OAS) issued its "Convention on the Protection of Archaeological, Historical, and Artistic Heritage of the American Nations." Known as the "Convention of San Salvador," it is concerned primarily with the illegal export and trafficking in antiquities, although also stressing that each country ensure modern excavation and conservation practices, maintain an inventory of cultural properties, and pass legislation protecting sites from destruction. Primarily the Central American republics – Guatemala, Honduras, El Salvador, Nicaragua, Costa Rica, and Panama – follow and are actively engaged in the Convention of San Salvador.

Three European regional agreements between 1985 and 1992 – *the European Convention for the Protection of Architectural Heritage* (the so-called *Granada Convention*), issued from Granada in 1985; *the European Convention on Offences to Cultural Property* (the so-called *Delphi Convention*), issued from Delphi in 1985; and *the Convention for the Protection of the Archaeological Heritage of Europe* (the so-called *La Valetta Convention*) issued from Malta in 1992 – form the basis of a European Union agreement on heritage protection. The *La Valetta Convention*, which replaced the *European Convention for the Protection of Archaeological Heritage* signed in London in 1969 and recognizing that Europe's archaeological heritage is increasingly threatened by development, aims to "protect the archaeological heritage as a source of European collective memory" (1992, Article 1.1). It further seeks to protect that heritage – that three-dimensional information storage matrix, as mentioned earlier – through prohibitions on illicit antiquities trading, pursuit of noninvasive archaeological investigations, and basic protection of archaeological resources.

UNESCO

Since its founding in 1946, the United Nations through UNESCO has issued six conventions (1954/1999, 1970, 1972, 2001, 2003, 2005), one declaration (2003), and nine recommendations (1956, 1968, 1972, 1976, 1976, 1978, 2015, 2015, 2015) in some way providing for the protection of cultural properties, ranging from protection of architectural and archaeological sites, through execution of proper scientific research on those cultural properties, to prohibitions on illicit excavations and trade in antiquities (Table 1). The vast majority of nation-states are signatories to each of those conventions.

Three conventions are seen as key: the *Convention for the Protection of Cultural Property in the Event of Armed Conflict*, often referred to as the *Hague Convention*, with the first protocol set forth in 1954 treating the return of cultural property after conflict and the second protocol in 1999 refining issues while extending penalties for violations; the 1970 *Convention on the Means of Prohibiting and Preventing the Illicit Import, Export and Transfer of Ownership of Cultural Property*, which treated national ownership of moveable or portable cultural property; and the 1972 *Convention Concerning the Protection of the World's Cultural and Natural Heritage*, which addressed the deterioration and destruction of the world's cultural and natural heritage. This 1972 Convention, known as the *World Heritage Convention*, is what established the World Heritage List, which includes what are termed World Heritage Sites, "properties forming part of [the given signatory nation's cultural heritage and natural heritage. . .which it considers as having outstanding universal value" as set forth by the Convention's criteria. Together, these three UNESCO conventions have served variously as models or impetuses for the establishment of heritage legislation in nation-states either lacking a history of such legislation or nation-states newly emerged from outside administrative governance.

Key Issues/Current Debates

There are three key issues underlying the introduction of heritage legislation: (1) removal of cultural property from one nation-state to another (often viewed as loss of patrimony); (2) repatriation of cultural properties; and (3) damage, intended or not, to cultural properties as a consequence of modern activities.

The overriding issue underlying all heritage legislation has been the taking of cultural materials from the territory/jurisdiction of a nation-state. The taking could be in the form of items, recovered from archaeological research, transferred to another nation's university or museum. This underlies much of modern heritage legislation based out of the Mediterranean Basin, the original laws from Mexico (1826), Greece (1834), or the Ottomans (1874) being good examples. Or the taking could be the acquisition by private individuals of materials for personal use, be it for personal display or for commercial sale, which actually has a greater antiquity. Alexander's classification of the looting of Cyrus's tomb as an attack on the legitimacy of the state or the concerns during the Song Dynasty would fall in here.

The term used for the unauthorized removal of cultural materials is "looting." The issue, though, is complicated by the need to distinguish between legitimate transfer of ownership during one period that no longer is recognized as legitimate in another, subsequent period and the acquisition of materials in a manner deemed illegal regardless of the period.

Major related issues to the ongoing looting of cultural materials all derive from the social structure that results in the heritage legislation. Heritage legislation is a product of stratified societies and is initiated when the upper social classes are sufficiently concerned about national patrimony to move the forces of the state to deal with the threat to that patrimony. It is the degree to which the upper social classes desire heritage legislation to be *enforced* that the resultant laws or regulations *are* enforced. Modern Greek antiquity law was framed in part to accommodate government employees who were also antiquity collectors; museums and auction houses in the USA have long lobbied that nation-state to not become a party to international rules.

None of this is right or wrong; rather, it is how stratified societies work. Since that is how stratified societies work, it means that until and only when a situation is in the best interests of society's upper social stratum will legislation against looting and its equivalent be enacted and then enforced (and being enacted does not automatically mean that it will be enforced). Further, that will hold for only as long as it *is* in that upper social stratum's interest. Thus, several sub-Saharan nation-states are UNESCO signatories, but the rules are ignored while private gains in looting are made by those in power.

Stratified societies have by definition "haves" – people with power, privilege, and prestige, as Gerhard Lenski, following from Max Weber, noted – and "have-nots" those lacking such. Lenski, as Weber before him, noted that power, privilege, and prestige were social resources, enabling those who have such (again, the "haves") to exercise their will in matters regardless of how those lacking such social resources (the "have-nots") may feel about how matters should be addressed. What is defined as "looting" is also, in the end, defined by the given society's upper social classes. However, looting is often for the lower social classes a fiscally lucrative endeavor, where the income derived from it can form a significant portion of a lower social class family's annual income. The looting of graves and archaeological sites for material gain – often by local farmers – has been going on around the world for several millennia. Indeed, the lower social classes often view heritage legislation as a product of the upper social classes and as an instrument that prevents those lower classes from accessing wealth that from their perspective is no longer of any immediate value.

Another issue is repatriation, which may seem odd for a topic dealing with the introduction of heritage legislation. However, it appears to be the grounds under which a given nation-state introduces heritage legislation that can make repatriation an issue. Laws in several Spanish-American nation-states make provisions for reacquiring

cultural property that has left the current geographic boundaries of the country. The Elgin Marbles – again – can serve as an example. They are seen by Greece to belong in Greece, and Greece has a law now that says that those Marbles – like other Greek antiquities – are to be brought back to Greece. That law is derived from an earlier sequence of laws, beginning in 1834. Those laws in effect: (1) declare that anything made within the current geographic confines of what is now the Greek state (2) belong to Greece and (3) that Greece has every right to buy back or otherwise acquire said wandering antiquity, with a tacit understanding that the current possessor must sell. Yet the Elgin Marbles were removed, amid controversy yet under permit (Lord Elgin claimed to have a firman, a claim that in modern times has been challenged) between 1801 and 1812 from the Ottoman Empire, and then purchased from him by the British government in 1816. That purchase was well before the modern Greek state existed and 18 years before the first of Greece's laws – laws set out before Greek independence from the Ottomans – came into being. A second issue, then, is who owns the past and how retroactive is that ownership? And that is an enormous pan-cultural/state debate.

Repatriation has become a retroactive restoration of materials. In the USA, the *Native American Graves and Repatriation Act* (NAGPRA) requires that items associated with American Indian burials recovered as part of a federally enabled process to be returned to the descendants of the peoples who interred those remains. However, the issue that emerges with such actions is identifying suitable cultural antecedents to whom those cultural materials are to be repatriated. There are instances in the USA where the federal interpretation of NAGPRA requires that burial remains be handed over to the descendants of the people who killed those who were buried, that is, handed over to the decease's sworn cultural enemies. Such things were unanticipated when the laws were first set up and are extremely complicated and touchy in their resolutions.

The third issue underlying the introduction of cultural heritage legislation has been a potential damage to cultural properties, be it collateral or intentional as may occur during war or unintentional as may happen during construction. In the USA, any federally enabled land alteration project must first have the affected area checked to see if there are any cultural properties present that could be listed on the National Register of Historic Places. If such are present, then there is a regulatory system in place to evaluate those materials relative to what is already known and then to either protect or record so that the loss of those materials through construction is not a major issue. Counterpart regulations also often exist in the USA at the state and, much less often, local governance levels. Similar procedures exist in many nations, Mexico, the British Commonwealth, and general European Union being good examples.

International Perspectives

There are three international-scale perspectives on heritage legislation and its presence: (1) the very existence of a tolerated international market enabling illicit trade in antiquities; (2) differences in how languages classify reality and thus what is or is not heritage needing protection; and (3) intentional destruction of the heritage of one culture by another, conquering or ruling culture.

The first major issue on the international scale involves illicit trafficking in cultural property. Despite UNESCO as well as regional and even national laws, such trade continues. Where laws prohibit, enforcement is inconsistent. Some of this erratic enforcement can be seen to arise from conflicts of interest within the particular nation-state; some of it, though, can be seen as a fundamental difference in how one culture understands the world to work relative to another. In any event, illicit trafficking in antiquities cannot be substantively reduced until there is complete international commitment to stopping it.

The second issue involves how reality is classified. The main impetus for the introduction of heritage legislation has come out of the Western Intellectual Tradition and as a result out of a linguistic heritage that places a great deal of value on how old things are, as well as on how

"material," for lack of a better term, things are. Other parts of the world, with other linguistic classificatory schemes, do not see things quite this way, melding what in an Indo-European language would be past and present into a continuum. This is an issue among sub-Saharan African nation-states; it is also an issue in New Zealand and the USA. In the latter, American Indian languages and kinship systems do not distinguish "past" from "future" in the same way as English. For American Indians, the skeleton of a centuries- or millennia-old individual often will be seen as the remains of a person closely and immediately related to the particular American Indian group. The phrasing that that American Indian people will use will express in English that closeness of relationship as "recently departed next of kin." This is extremely hard for English speakers to internalize but, for the American Indian group involved in such removal and handling of burial remains – prehistoric *only* in English-speaking US eyes – is extremely upsetting. Again, this goes back to what was said above about how people think in and classify their reality through their language.

A third issue is that not everyone's heritage is seen as heritage by others. Historically, conquering nations have either attempted to merge the heritage of the conquered with their own or to erase that heritage, the Spanish razing of Mesoamerican temples and then the capping of said with their own churches being such a case, a practice common across post-Roman Europe as Christianity spread, but also found across South Asia for both Hindu and Islamic places of worship.

The destruction by ISIS of millennia-old Christian libraries and churches, to say nothing of the World Heritage site of Palmyra, or of the medieval Islamic libraries in Timbuktu by Islamic extremists reflect an ongoing problem of religious intolerance. Proselytizing religions hold that everyone else except the practitioner is in error. A logical extrapolation from this – frequently exercised throughout history – is that the conquered people must have the material heritage associated with their beliefs destroyed (it should be noted, as part of this, that commonly in the classical world the conquering peoples defaced and otherwise destroyed the images of their foes – the destruction of the cultural materials of subject peoples has a long and bitter history). And while Islam – among other proselytizing religions – has done this for centuries, the destruction of the Library at Alexandria and the stripping of the façade from the Pyramids to construct mosques being two better known examples (the core blocks of the Pyramids proved too large to be taken away), it is not alone; the Franciscan obliteration of the Mayan libraries in the 1500s ranks, along with the First Emperor's burning of the books in 220 B.C. in China, as similar – and successful – efforts to erase a people's cultural heritage. The Mediterranean Basin has a long history of destroying heritage properties after conquest; so, too, do most other nation-states. This even includes modern regime changes: Mao Ze-dong had the walls around Beijing pulled down and during the Cultural Revolution encouraged destruction of Confucian monuments and tombs.

Future Directions

The future directions for the introduction of heritage legislation go into two directions: international and intranational. International directions include further refining of existing legislation to cover heritage issues left vague or unaddressed by earlier acts while also getting hesitant nation-states to endorse or otherwise approve the various UNESCO conventions and recommendations. Nation-states must always act in their own interests first; this means that the aims of heritage legislation have to be shown to be of paramount importance for each particular signatory and must be done so in ways that can be enthusiastically embraced by that signatory. Until that is done, the various regional and international agreements will work more as ideals than actualities.

There are two future intranational directions, one which works for the other. The first is the emplacing of heritage legislation that is detailed

in what is covered and what triggers protection. For example, in the USA, any federally enabled action that results in land alteration or property transfer requires the area impacted to be examined first to see if anything present *could* be listed on the National Register of Historic Places. Such listing is specific in the general categories but quite flexible in what within those categories is eligible. But again, as mentioned under "International Perspectives," the USA works in an Indo-European language along with a cultural heritage driven by an empirical, Aristotelian, Enlightenment perspective of fixed rules and protocols, something derived from Roman law by way of English common law.

In the USA, Australia, and to some extent South Africa, retrieval of imperiled heritage properties has become a business concern, where private-sector archaeologists, reviewed and regulated by government archaeologists, recover endangered archaeological materials in response to heritage regulations. However, in the USA particularly, such work outside of a university setting in what has been until the mid-1960s traditionally an academic field is viewed as anathema, such that those participating are normally refused candidacy for faculty posts. Yet, such work melds the need to save a long-term three-dimensional information storage matrix with ongoing research questions, generates basic analyses while saving that information, and offers a chance for new archaeologists not just to do research but to underwrite future research. Indeed, in the USA particularly, major referents for ongoing scholarly questions in prehistory are scientists in either the archaeology divisions of engineering firms or stand-alone archaeology/cultural resources firms.

The collapse of public archaeological research funding along with the enormous surplus of PhD archaeologists as well as the needs both of the German research university model for publications and of the emplaced regulations together will drive an emerging private-sector/university research alliance enabled by heritage legislation. In the USA, where the demographics are well known (e.g., Neumann and Sanford 2010), there are around 1,300 university archaeologists, but federal research funding goes to fewer than 20. The private sector now does the vast majority of empirical research, and that research is funded through private contracts that bring clients into compliance with heritage regulations. There is at the same time a shortage of people to work within private-sector firms doing archaeology, which employs six out of every ten archaeologists in the USA with another two in ten serving as government regulators. A similar ratio of private-sector to academic-sector archaeologists appears to exist in the Republic of South Africa and Australia, at least to judge by institutional affiliations listed among the association of Southern African Professional Archaeologists and the Australian Association of Consulting Archaeologists. Both of those countries also have an active private-sector archaeological community addressing compliance requirements from heritage legislation.

Certainly in the USA, the capacity to protect archaeological heritage properties has in large measure been due to the availability of full-time archaeology firms (either stand-alone firms or divisions/departments within engineering firms) to execute the demands of the nation's heritage legislation. A future direction, then, not just in the USA but globally, will be archaeologists helping entities to comply with the requirements of heritage legislation. The second intranational direction grows out of that first, that presence of legislation that automatically triggers protection: development of professional heritage archaeologists who make those regulations work.

Related to this, a second collateral direction will be the mandatory training of future archaeologists in heritage legislation. Most university curricula internationally prepare the nascent archaeologist for life within a university setting. However, the field technique, research, and management skills needed to do heritage-driven archaeology, especially as a full-time non-university exercise, are often quite different and rarely are presented in university settings. Future archaeological training will need to address not just how the heritage legislation and associated regulations work in the particular nation-state but

also how the data recovery mechanics work in the extra-academic world.

Heritage Museums and the Public

Steven Lubar
John Nicholas Brown Center for Public Humanities and Cultural Heritage, Brown University, Providence, RI, USA

Introduction

Museums are public institutions. The American Alliance of Museums Code of Ethics states that "for museums, public service is paramount." But there is continuing and useful debate about how public service – indeed how the public – should be defined; what the public might require, demand, or need; and what the museum might offer. How might museums balance the needs of general and specific publics? How should museums balance their responsibility to the immediate needs of the public today and those of future publics?

Museums have long been public institutions, but the nature of their interaction with the public

has changed. Victorian museums often aimed at "edifying" the masses. In the early twentieth century, many museums saw their role as providing training for citizenship. Exposure to the best that civilization had to offer, the thought went, would improve museum visitors, making them better people and better citizens. Toward the end of the twentieth century, many museums aimed to educate and inspire the public and to work toward democracy and social justice. In the words of museum theorist Stephen Weil (1999), museums moved "from being about something to being for somebody."

Current Debates

Over the past few decades, the role of the public in heritage museums has changed dramatically. Members of the public or the publics – many museums now prefer to use the plural to acknowledge the diversity of participants in their communities – have gone from being *visitors*, passive recipients of the wisdom of the curators to *participants* in museum processes and have become increasingly central to the ongoing work of the museum. Many museums – though by no means all – have begun to share authority with the public.

This has happened in three ways. Many heritage museums have invited source communities to participate in the curation of collections and exhibitions, giving them a measure of control over the aspects of the museum related to them. Funders looking for results from their support have insisted museums measure the outcome of their work, to show how they have changed the visiting public. And, in what has been called Museum 2.0, museums are increasingly allowing visitors to co-curate collections and exhibitions, part of a more general rise in participatory culture.

The reasons for these changes are social, cultural, and technological. Aboriginal peoples have gained new political and cultural authority. New public funding sources have demanded that museums consider public outcomes of their work. The rise of a postmodern museology that encourages multiple points of view and decenters authority, part of a larger cultural change that has shifted authority from experts to participants, is key. So too is the rising importance of education as the goal of museums and the concomitant rise of evaluation, making reception of the message as important as transmission. Finally, new technologies, especially Web 2.0, have made it much easier for the public to participate in museum exhibits and have raised the expectation of participation as a norm of cultural experience.

Heritage museums with indigenous collections have seen the most dramatic changes in their public role. Stating in the 1970s, as part of a postcolonial rise in communities demanding control of their history and future, many source communities for museum collections protested the way their objects were displayed and the way their stories were told. Heritage museums, they noted, were agents of colonialism and deculturation and needed to be redefined for a postcolonial era–to be "decolonized." Repatriation, the creation of culturally specific museums, and a new role for these publics in heritage museums reshaped museum culture.

Indigenous peoples around the world, and especially in the United States, Canada, Australia, and New Zealand, gained increased control of the stories museums told about them. In the United States, Native Americans wrested some collections away from museums, a policy written into law by the Native American Graves and Repatriation Act of 1990. The National Museum of the American Indian (1989) put Native concerns central to its mission; it "works in collaboration with the Native peoples of the Western Hemisphere to protect and foster their cultures by reaffirming traditions and beliefs, encouraging contemporary artistic expression, and empowering the Indian voice." In New Zealand, a policy of biculturalism gave Maori a formally recognized stake in the display of not only cultural materials but also historical paintings that showed their ancestors (Kirshenblatt-Gimblett 2012). The rise of ethnically specific museums in the 1980s, for example, the Wing Luke Museum of the Asian Pacific American Experience, in Seattle, and the Japanese American National Museum, in Los Angeles, shows the increased role that specific publics

play in heritage museums. These museums preserve and tell a community's story by and for that community.

The general audience for museums has also come to play a larger role in the work of museums. Part of a widespread rise in participatory culture, many heritage museums now consider their public audiences as the central factor in collecting, research, and display, where they might once have put collections, or research, in that place. A focus on the importance of the audience's needs and interests was rare, but not unknown, in the early twentieth century. For example, John Cotton Dana, director of the Newark Museum, emphasized the importance of allowing local communities to help shape the collections of museums and the stories told about them. "Learn what aid the community needs: fit the museum to those needs," he wrote (Dana 1917).

This focus on the importance of the public as audience became common in museums in the 1980s and 1990s. Increased dependence on federal and foundation funding and an increased demand by funders for evaluation of the results of their funding played a key part. Museums moved from considering *intent* of their programs (what did they claim to do?) to *output* (what did they produce?) and to *outcomes* (what change did they produce in their audiences?). This change, following similar changes in social services and then education, meant that audiences were central to funding and thus to mission.

Related to this is the rise to prominence in many museums of museum educators. "Audience advocates," as some educators called themselves, were responsible for seeing that exhibitions worked for an increasingly diverse audience. Evaluation became central to exhibitions, with questionnaires, focus groups, and other survey instruments becoming a part of the process of exhibitions in many museums. Front-end evaluation helps shape ideas for exhibits, based on public interests and knowledge; formative evaluation helps to shape exhibition concepts and techniques; and remedial and summative evaluation helps to suggest improvements or to show funders that exhibitions had the desired outcome. Together, these kinds of evaluations bring the public's voice into the processes of museum work in significant ways.

The third trend in the increasing role of the public in the heritage museum is the rise of audience participation in museum work. This trend, part of a more general participatory culture, is sometimes called Museum 2.0 (the term, coined by museum consultant Nina Simon, is derived from Web 2.0, the increased participation, collaboration, and interoperability that became common on the World Wide Web starting in about 2004). It is a part of more general trends in public engagement noted above but includes a more profound sharing of authority with the public.

Like Web 2.0, Museum 2.0 embraces the idea of a two-way interchange and the blurring of lines between authors and readers or curators and exhibit audiences (Simon 2010). While visitors have always been cocreators of meaning, interpreting exhibitions based not only on the intent of curators but also based on their own interests and knowledge, museums have increasingly recognized this, allowing visitors to suggest collections for acquisition, choose objects for display, display their own collections in museums, "tag" collections both online and in the museum, and add their own labels to exhibitions, among other experiments.

Future Directions

The notion that the museum is fundamentally for the publics that use it and should be shaped to their needs and desires – rather than about museum staff expertise, collections, or research – remains a contested one. The contest of ideas about the role of the public in museums and the compromises and synergies that it promotes provides for some of the most exciting opportunities in museum work today.

Heritage Research and Visitor Planning

Hilary du Cros
Faculty of Business, University of New Brunswick, St. John, NB, Canada
Management Discipline Group, UTS Business School, University of Technology, Sydney, NSW, Australia

Introduction

Visitor planning and management are crucial to achieving the sustainability of resources presented and the effectiveness of the educational messages imparted in the visitor experience. Increasingly, the world is developing an experience economy. In terms of visitor planning, designing meaningful and engaging visitor experiences is also becoming as important as managing physical impacts. Archaeological heritage assets are also meaningful in more than one context, and planning should take into account pluralism in their presentation by using the most comprehensive heritage research available, as well as paying attention to physical planning issues, such as visitor flow. Accordingly, this entry will discuss planning principles and models for managing physical impacts of visitation, as well as a few examples of the measures essential for ensuring a memorable and educational visitor experience.

Definition

Visitor management has been defined as "the management of visitors in a manner which maximizes the quality of the visitor experience while assisting the achievement of an area's overall management objectives" (Hall and McArthur 1998: 107). This definition would fit with that for most archaeological heritage sites but perhaps not purpose-built facilities, such as museums, which tend to act as if visitor management is not a distinct activity. Accordingly, museums tend to submerge visitor management for archaeological assets among a number of planning and management concerns.

Underlying Principles

The three key books that have influenced the development of visitor management for archaeological assets in most cases deal with both heritage sites and museums (Hall and McArthur 1998; Leask and Yeoman 1999; Swarbrooke 2002). Hall and McArthur (1998) outline a range of possible visitor management models for heritage sites, from those developed directly for mainstream tourism attractions (e.g., Recreation Opportunity Spectrum) to those that have been applied more commonly to archaeological and other heritage sites (Carrying Capacity and Limits of Acceptable Change approaches). Leask and Yeoman (1999) principally advocate an Operation Management System based on Schmenner's Service Process Matrix (1995). Overall, both Hall and McArthur (1998) and Leask and Yeoman (1999) advise the use of specific models in order to assist heritage managers achieve a balance between visitor experience requirements and conservation needs.

In terms of the underlying principles of visitor management in relation to archaeological assets, Table 1 will act as a basis for the discussion that follows.

Heritage Research and Visitor Planning, Table 1 Underlying principles of visitor management for archaeological assets (based on du Cros and McKercher 2015 and own later research)

Themes	Principles	Explanatory notes
Nature of archaeological assets	Not all archaeological assets are suitable for visitation or should be visited	Some assets may be unsuitable for a number of environmental, social, or political reasons
	Purpose-built facilities, such as museums and visitor centers, are easier to manage well for visitation than archaeological sites	Although this seems obvious, resources are not always allocated in a way that reflects this principle or protects the asset
Factors influencing visitation levels	Access and proximity to large population centers and easy transport dictate the potential number of visitors	Consequently, remote assets will have to be very appealing or well known to attract visitors. Also, popular assets may need congestion management to prevent impacts
	Time availability influences the quality and depth of experience sought	Some visitors may not allow themselves or be allowed by others to spend much time during the visit
Visitor behavior	The visitor experience must be controlled, which in turn controls the actions of the visitor	Careful design of the activities the visitors' undertake is essential to the first stages of planning. It will also govern expectations of the visit later on
	Visitors want controlled experiences	Most visitors are risk adverse
	If visitors encounter engaging interpretation or activities, there is likely to be less damage to assets	Research has shown that bored or unhappy visitors are less likely to absorb conservation messages
Visitor experiences	Visitors differ in depth of experience sought	Marketing research is therefore essential as part of visitor management and planning
	Visitors want memorable and enjoyable experiences	Who would not? However, this aspect does not always get directly addressed in planning
	Updating and improving interpretation needs to be an ongoing process	Repeat visitation, particularly from a local area, is more likely if resources can be found to provide new ways to engage visitors over time
Tourism issues	Not all tourists are alike	Increasingly, popular assets are being visited by tourists from all over the world, so language and other needs have to be taken into account
	Not all archaeological assets are tourist attractions	Tourist market appeal does not equal archaeological significance – They are two different things
	Cultural tourism products may be presented in a challenging and confronting manner, but cannot be presented in an intimidating or accusatory manner	Conservation and other messages cannot be absorbed, if the visitor feels unwelcome or uncomfortable for some reason

Key Issues and Current Debates

Key issues for visitor management generally revolve around the initial planning, operations management, and ongoing monitoring and revision of actions. This cycle is often inseparable from other kinds of management for a well-managed heritage asset. Even so, some issues may arise for monitoring efforts that require faster or more frequent revisions. If an archaeological asset is managed with consideration of service quality, this aspect will often be one that requires frequent attention and revisions.

An example of a current debate regarding visitor management is that regarding whether World Heritage Sites are always managed as exemplars

of international best practice and in a way that clearly conveys their outstanding universal values to visitors (Su and Walle 2011). The sad truth is that, despite receiving such a designation, many sites have been inscribed without visitor management plans and a number still lack these instruments to guide the institution of best practices, despite availability of information on the topic (e.g., Pedersen 2002). Taking a step back, the evaluation process for nomination should actually call for more information on possible visitor and tourism development impacts to make this planning easier.

Another delicate issue is that of how to manage visitation of archaeological sites that are close to, or of significance to, particular groups. Asia has a number of significant archaeological sites that either include settlements (Angkor World Heritage Site) or are located close by settlements (Wun Yiu Archaeological Site, Hong Kong) (Miura 2005; du Cros and Lee 2007). Multiple issues that need some consideration in planning and management include shared use, visitor flows, profit from visitation, possible impacts on privacy, use of local volunteers, and employees in education/interpretation programs. Archaeological sites that have been more recently found to have significance for particular groups, such as for Stonehenge and Avebury in the UK, where these groups want to conduct rituals or festivals at these sites, need visitor management planning strategies to prevent inconvenience to other users and possible damage to the asset (Morris 2011).

Recent research on visitor behavior and visitor experiences (McKercher et al. 2008) indicates that inappropriate behavior (such as souveniring) can involve a complex set of rationalizations. The visitor may well know that what they are doing is against conservation needs or other interests but deals with this knowledge in a number of different ways cognitively to assuage their guilt. Strategies to engage visitors before they decide to undertake some activity likely to result in a negative impact are more successful than leaving them on their own to decide. Such strategies generally include greeting and orientation at the start of the visit (Shackley 1999), clear signage, and engaging staff who provide more than just a security function in order to manage the visitors' experience. Accordingly, bored visitors have been found to be more likely than others to engage in inappropriate behavior (du Cros 2007; McKercher et al. 2008).

Finally, a key issue for popular archaeological assets is that of overuse, which is a part of the overtourism phenomenon (Goodwin 2017; Seraphin et al. 2018). This is an issue for cases where there are many user groups competing to visit or where the asset is particularly well known, such as some archaeological sites in Europe. Some popular assets are already seeing impacts from overuse (such as congestion) as tourism grows to include visitors from developing countries to others' and their own countries' attractions. The United Nations World Tourism Organization (UNWTO) has issued a series of reports about tourism management and sustainability issues that sometimes include archaeological assets. The Tourism Congestion Management at Natural and Cultural Sites' (UNWTO 2004) set of guidelines is particularly useful in this respect.

Future Directions

Future directions for visitor management of archaeological assets may include more attention to and discussion on international best practices. While funding and resources will always remain a problem for many sites, there still should be more discussion on how new strategies can be used. Even those strategies that utilize community involvement and information communication technology (ICT) can be inexpensive and employed to prepare visitors' expectations prior to arrival and promote better visitor activities that engage the public. Also, visitor management needs to be more clearly recognized as important prior to any kind major promotion or designation of assets.

Archaeological heritage management of assets for tourism means more partnerships with tourism stakeholders. For instance, archaeological authorities interested in responsible tourism are finding that there are a number of initiatives in place from intergovernmental sponsored projects to self-regulation of tour operators (UNWTO 2019). Marketing still has an important role to play in visitor decision-making and behavior, and so heritage managers should try to employ more and increasingly sophisticated marketing research techniques to aid them in understanding how to reach their publics.

Overall, tension remains between resourcing services for the visitor experience as against the asset's long-term well-being. Visitor management could be seen in this context as a means to "generate a benefit between the heritage manager and visitor" (Hall and McArthur 1998: 138). While it tries to provide as high a quality visitor experience as possible from within its resources, it must also provide this service without allowing a reduction in the values of the asset. Some issues for future heritage managers and others to research may include increasing/decreasing visitation levels; visits involving shorter time frames; increasing public expectations; increasing mobility, such that nowhere is truly remote; changing markets; increasing politicization of heritage (in some countries); unpredictable weather conditions; and finally, unpredictable and often decreasing resourcing.

Heritage Sites: Economic Incentives, Impacts, and Commercialization

Peter G. Gould[1] and Paul Burtenshaw[2]
[1]Penn Cultural Heritage Center, University of Pennsylvania Museum of Archaeology and Anthropology, Philadelphia, PA, USA
[2]Sustainable Preservation Initiative, Los Angeles, CA, USA

Introduction

Particularly as tourism has grown into the world's largest service industry, heritage sites increasingly have been recognized as potential sources of revenue for government agencies, of economic development for communities, and of profit for private enterprises. The organization and exploitation of these opportunities, known as *commercialization*, takes myriad forms. The motivations for commercialization range from providing funding for preservation of heritage to the creation of jobs and profit from investments in commercial heritage. However, there is considerable debate about the consequences of commercialization for heritage sites themselves and for the people who live and work around them. Whether commercialization has constructive or destructive consequences for any particular heritage site depends on the distribution of the economic and noneconomic benefits and costs of commercialization, its *impact*, and on how stakeholders respond to the *incentives* created by these benefits and costs. The debate over commercialization thus raises ethical, practical, and technical questions that are of importance to archaeologists. Each of these three concepts – commercialization, impact, and incentives – is central to the economic analysis of heritage sites.

Definitions

Incentives

Incentives are the inducements that drive personal behavior. They may be pecuniary – working for wages or seeking to profit from an investment – or they may be nonfinancial. Economists argue that individuals whose behavior is incentivized by personal gain are likely to be more productive and efficient; however, if incentives are misaligned with social needs, they can generate undesirable behavior. Heritage sites produce a complex web of incentives. Some are *economic incentives*, such as the potential to generate government revenue to pay for preservation or the opportunity to profit privately from tourist investments. Others are *social/political incentives*, such as the opportunity for governments to inculcate an "authorized" vision of history or the potential to reframe the story of people and places in a manner that appeals to tourists. Such incentives may produce socially positive outcomes – monetary rewards from income or jobs benefitting community members or outside businesses – or the hope that the benefits of commercialization may motivate local people to protect heritage sites. But incentives also may induce undesirable behavior. Heritage sites typically are managed and staffed by archaeologists and heritage professionals whose behavior may be driven by noneconomic incentives, such as acquiring bureaucratic authority or professional standing. Similarly, communities may be incentivized to pursue economic gain at the expense of the authenticity and cultural values of their heritage sites or to compete for tourist revenues in ways that disrupt the harmony of local communities. The opportunity for economic gains may incentivize corruption among the stewards of heritage sites, with damaging consequences to sites, communities, and national patrimony. Such negative incentives work against the interests of other stakeholders. A thoughtful analysis of the incentives that face individual stakeholders is essential to understanding why people behave as they do with regard to heritage sites, which in turn is essential to shaping ethical and effective public policies toward heritage.

Commercialization

Commercialization involves the introduction of market-based practices to the management of a place, a product, or a social practice in order to make it available for public consumption. The

process may be instigated by government action or by private entrepreneurs, including community members, seeking to exploit market opportunities to create income and jobs. Tourism is a primary driver behind the commercialization of cultural heritage sites and related practices because both international and domestic visitors have great interest in cultural, historical, and archaeological displays. Heritage commercialization takes many forms. Heritage sites may be managed and curated for tourist visitation. Traditional crafts may be adapted to produce marketable products. Even traditional activities, such as rituals or art, may be reconstrued for sale or public demonstration. Tourism enables a variety of commercial activities at heritage sites including guiding; collection of fees for admission or entertainment; retail sale of books, souvenirs, or food; and economic activity associated with operating and maintaining the site. Archaeological sites may be exploited through the sale of images used in advertising promotions, books, or movie and television productions; and sites may be rented for private events. Museums may license the copies of objects in their collections. Outside of heritage sites and museums, one encounters local micro-economies of shops, transportation concerns, restaurants, hotels, and other retail and service businesses created to satisfy the heritage tourist. Such tourism "supply chains" (Gould 2018) exist at every tourist venue, from Machu Picchu in Peru to the British Museum in London. Finally, excavation research and conservation activities at archaeological sites may provide significant occasional revenues for local communities and host countries, processes that may be directly commercialized by scholars, nonprofit, and for-profit organizations who market participation in research and conservation to students and other paying members of the public.

Economic Impact

Economists measure the economic impact generated by commercialization on two levels, the direct impacts of commercialization associated with the site and the follow-on "multiplier" effects on the broader economy. These impacts are included in the gross domestic product (GDP) of the country. Direct impacts include the revenues received by heritage sites, the salaries paid to workers there, payments to vendors and others to supply and operate the site, and the investments in conservation, signage, and site preparation required for it to receive visitors. These direct impacts stimulate further economic activity, defined by economists as "multiplier effects." To illustrate: An investment in a retail shop at a heritage site generates demand for products sold there. Some portion of the money spent at the store will be kept by the owners, and the rest will be used to buy replacement goods from producers, who in turn must pay to restock their raw materials and pay workers or themselves. Some portion of workers' pay will be saved, but most will be spent on housing, food, clothing, and other necessities. The economic impact of spending at a heritage site is multiplied through this process of spending and re-spending. Governments also benefit directly from commercialization. Governments are responsible for many important heritage sites and often earn revenues from ticket sales and on-site services or from taxes on the private tourism sector. Spending by foreign tourists is counted in national income accounts as an "export" and is a key source of foreign exchange for many governments. Revenue from sites may be spent by governments to benefit the sites themselves, be redirected to subsidize other sites or national heritage in general, or may simply be used to support the general activities of government.

The overall economic impact of tourism is substantial. Worldwide in 2018, tourism is estimated to have directly generated almost 154 million jobs and $3 trillion in global GDP. Taking multiplier effects into account, tourism is estimated to have contributed 10.4% of global GDP and 10% of global employment in 2018 (WTTC 2019). Visiting heritage sites is a primary driver of this vast industry, although there are few detailed studies of the actual magnitude and impact of heritage tourism. One agency that does attempt to do so is the National Lottery Heritage Fund (NLHF) of the UK. The NLHF's study concluded that heritage tourism drove four out of ten overseas visits to the UK in 2009 and, even when visits

to natural heritage sites are excluded, generated 270,000 total jobs in the UK and accounted for £11.9 billion of GDP. Foreign heritage tourists are highly valued economically, but the majority of tourists in the UK are domestic travelers (HLF 2010). However, estimating the economic impact of a cultural activity is complex and a subject of considerable technical debate (Snowball 2008; Crompton 2006). The magnitude depends on whether the money triggering the effect originates outside or from within the economy under study, the source of investment capital, and the rate of spending or saving of the various members of the value chain. Heritage managers also need to understand how much of the multiplier re-spending occurs within their targeted economy (e.g., a local village) and how much is lost or "leaked away" from the local area and the local stakeholders in the heritage site. For example, if souvenirs sold at a site are made in another region or country, much of the value goes to those foreign producers. Similarly, if workers live in other regions or hotel accommodation are owned by national or international chains, the income earned by nonresidents is leaked outside the immediate region of the heritage site.

Key Issues and Current Debates

Site Protection

Those who enjoy an economic benefit from a heritage site may have an incentive to conserve and protect that site and even to invest in it to continue to receive that economic benefit. However, increased tourist visitation also risks degradation of the physical site from foot traffic or pollution. Furthermore, the commoditization of heritage may detach traditional artifacts, practices, and places from their original context, presenting them in a distorted form for consumption by visitors who may not value their cultural significance (Kehoe 2007; Silberman 2007). Over the long term, reliance on tourism may reduce local economic diversity, with adverse consequences in later years on sites and communities because tourist interests are highly unstable (Timothy and Nyaupane 2009: 56–69). Economic incentives for communities to protect places have been widely pursued in environmental conservation (McNeely 2006) and, to a more limited degree, in archaeology (Coben 2014). The concept of ecotourism relies on using tourist revenues to make natural resources economically valuable for the groups that otherwise may cause them harm or who are in a position to protect them. However, ecotourism programs have had mixed success, encountering problems that include challenges in getting economic benefits to intended groups (e.g., the local population), achieving a linkage in people's minds between the economic impacts and the natural resource, and producing the desired behavioral changes in response to the proffered economic incentives (de Vasconcellos Pêgas and Stronza 2008). Parallel issues have been seen with commercialization projects that have heritage preservation as a central objective. Archaeologist-led programs to create community businesses based on heritage are nascent and still developing strategies, models, and best practices.

Benefit Distribution

The distribution of the benefits from commercialization is a critical political and ethical issue, one that can lead to contention among local, national, and international stakeholders, each of whom may assert rights to the site and its benefits. The power held by stakeholder groups is far from equal, corruption is hardly unknown, and residents living adjacent to a heritage site may be disadvantaged in commercial competition. The preparation of a site to appeal to the tourism market may displace long-standing residents from newly demarcated parks, looters may become aware of the value of artifacts to be unearthed at the site, or the aesthetic or sacred values of the site may be disrupted. Local community members often lack access to the banking system, to investment capital, or to the political connections needed to obtain permits or approvals, and they may lack the market knowledge and experience essential to compete with more sophisticated outside parties, especially national or multinational corporations. As a result, the economic impact of tourism can be compromised by high levels of leakages away from local stakeholders. The jobs created by

heritage commercialization can be low wage, informal, and seasonal and are exposed to fluctuations in tourist demand. Similarly, the jobs created through archaeological research can also be low paid and seasonal, with higher-skilled, better-paid jobs inaccessible to unskilled local populations. The distribution of benefits depends on the capability of stakeholders to take advantage of economic opportunities, as well as the multiplier benefits and leakages discussed above. Whether any particular distribution pattern is acceptable will depend on the political, social, and economic context of each site and the aims of any commercialization project. Studies into the distribution of economic benefits have demonstrated the severe challenges facing efforts to direct the benefits of heritage commercialization to local stakeholder groups (Adams 2010; Kausar and Nishikawa 2010; Hampton 2005).

Privatization

Heritage sites are often referred to by economists as public goods, tangible or intangible resources that benefit people in common in ways that cannot be managed purely through private ownership. Private goods, by contrast, are those that can be owned and controlled for the benefit of individuals for the purpose of making profits. Neoliberal economists, whose impact on public policy has been strong in countries such as the UK and the USA, argue that an entrepreneur incentivized by the opportunity to earn a profit on investment introduces to heritage management competitive pressures, financial capital, operational skills, knowledge of customer desires, and the willingness to take financial risks. In the case of heritage sites, neoliberal policies have promoted the emergence of privately owned businesses to deliver tourist services and, in limited cases, enabled entrepreneurs or nonprofits to manage the activities of museums and archaeological sites. In a period when most national governments are under stress, privatization can appear to be a particularly attractive policy. However, markets do not work optimally when faced with the extended time horizon of heritage sites and their important noneconomic values (Mason 1999). Such "market failures" have occurred sufficiently often that skepticism is rising, including in the management of heritage, that privatized services can deliver efficient and effective solutions.

Measuring the Benefits

A key issue is how one determines which heritage sites should be given priority for commercialization. Economists often take a "benefit/cost" approach to such questions (Brent 2017). In principle, this is a straightforward matter of comparing the benefits of a project, in monetary or other quantifiable terms, to the investment and operating costs of the project. If the value of the benefits exceeds the costs, the project may be seen as having a positive overall return. If not, it is either a poor investment or requires a government subsidy to continue providing benefits to the public. However, the measurement of the benefits flowing from cultural heritage is confounded because many of those benefits are intangible and difficult to reduce to monetary terms or otherwise quantify for the purposes of benefit/cost comparisons. The noneconomic values of heritage can include the local or national identity attached to a site, the value to Indigenous people of sustaining aspects of their culture that are not shared with fellow citizens, the scientific or historical value of preserving artifacts from the past, the aesthetic value of a site, or the general social value derived from uplifting the public through education that results from visiting heritage sites. Commercial heritage management is unlikely to prioritize those values. Furthermore, as pointed out above, there may be intangible costs to commoditizing heritage sites, such as site degradation or the desecration of places sacred to Indigenous people. Economists have developed tools that attempt to measure the value of cultural heritage through a variety of techniques (see Snowball 2008). They are subject to numerous qualifications and technical limitations that render the evaluation of the benefits of heritage sites a problematic enterprise. Furthermore, stakeholders' incentives may be widely divergent, leading to very different views on the value of any particular heritage site.

Sustainability

The economic principles governing the commercialization of heritage are applications of neoclassical theories developed to explain the behavior of firms and consumers in short-term market situations. While the theory may be applied sensibly to some long-term problems, there remains the problem that the time horizon associated with heritage sites – measured in decades if not centuries – is difficult for market-based institutions to address appropriately. Decisions whether to preserve, conserve, or open a heritage site to the public have implications that extend well beyond one individual's lifetime, which introduces the matter of "sustainability" to heritage site commercialization. Three decades ago, the Brundtland Commission defined sustainable development as a process that "seeks to meet the needs and aspirations of the present without compromising the ability to meet those of the future" (WCED 1987, Ch.1 Par. 49). Applied to heritage sites, that definition raises questions such as: What is to be sustained, for whose benefit, and for how long? And, who will make those decisions? Governments historically have performed this role. However, as noted above, some policymakers argue that market-based management solutions are a better choice. Alternatively, archaeologists increasingly see ethical and practical reasons to lodge decision-making responsibility in community-based structures. This divergence of views gives rise to a debate whether "top-down" or "bottom-up" control over heritage commercialization is most likely to meet the standards of sustainability. That debate, which also pervades the broader economic development literature, has practical, theoretical, and political implications that yield no single resolution (Binswanger-Mkhize et al. 2010).

The Role of International Organizations

International organizations have come to play an important role in the commercialization of heritage resources. UNESCO certifies as World Heritage Sites those deemed to exemplify "outstanding universal value" and requires management plans and detailed schemes both to conserve and preserve the site and to exploit it for economic purposes through tourism (Robinson and Picard 2006). World Heritage Site status is widely sought-after for its value as a tourism-inducing brand. International financial institutions, including the World Bank and regional development banks, provide capital for infrastructure investments, such as roads, electrification, and water systems, that often are required for successful heritage tourism (Cernea 2001). International nongovernmental organizations, such as the World Monuments Fund, the Sustainable Preservation Initiative, and the Global Heritage Fund, have experimented with community-based projects intended to create economic benefits for localities adjacent to important archaeological sites. Government entities such as USAID in the USA and the European Commission also are significant underwriters of projects that engage heritage resources to promote economic development. Usually, these international programs are undertaken with the approval and involvement of national governments, although increasingly NGOs are looking at alternative community-based models in order to address the operational failures of past top-down-driven programs or to redress the unequal distribution of benefits from past projects. Regardless, the intrusion of international organizations into heritage commercialization has introduced an array of new stakeholders to the processes of heritage conservation and commercialization. Often these institutions and individuals have priorities, values, and incentives that are very different from the national and local stakeholders in heritage sites. Furthermore, as critics of international organizations engaged in the heritage process point out, these international organizations lack the financial resources and enforcement powers needed to protect heritage and have been shown to respond to institutional and international political incentives in ways that are contrary to the long-term interests of cultural heritage sites (Meskell 2018).

Future Directions

Commercialization of heritage sites has proceeded rapidly since the 1950s as countries have

competed for the burgeoning income from tourists. However, the adverse consequences of the often-perverse incentives created by large-scale heritage bureaucracies, privatization, and the drive for tourist revenues also have become increasingly evident. The quest is for heritage management approaches that incentivize behaviors that will promote conservation of heritage sites and honor their cultural value even while delivering the beneficial impact of commercialization to communities and to national economies. In some countries, such as the UK in recent years, this project has resulted in greater levels of privatization and market dependence. In others, such as Italy, decentralization experiments are underway to improve efficiency and responsiveness to tourist needs while diminishing the influence of conservative cultural bureaucracies. In China, many aspects of heritage management have been devolved to regional and local authorities. With government budgets facing competing demands from urgent social problems, the tourism market will continue to be an alluring source of local and national economic impact, and cultural heritage will remain at the center of both national discourses and commercial opportunities. Thus, while experimentation in the management of heritage commercialization is in its infancy, the search for better ways to manage commercialization, limit the consequences of undesirable incentives, and promote desirable impacts will continue unabated.

Heritage Theory

Helaine Silverman
Department of Anthropology, University of Illinois at Urbana-Champaign, Urbana, IL, USA

Introduction

The field of heritage studies burst onto the academic scene in the late 1980s in tandem with the birth of critical museum studies, rise of the new social history, growth of postcolonial theory, the cultural turn in anthropology, and so forth throughout the humanities. Over the past three decades, heritage studies have ranged from descriptive to theoretical, local to worldwide in scale, focused on developing and developed societies, and directed at deep prehistory through to the present day. A multitude of issues in countless places have been addressed, sometimes repeatedly with different disciplinary nuances.

Definition

The retheorization of heritage studies as "critical heritage studies" (henceforth, CHS) focuses on many topics of interest in the humanities and social sciences overall: bodies of knowledge, class, colonialism/postcolonialism, dominant rhetoric/authoritative discourse, gender, globalization, identity, ideology, institutions, memory work, nationalism, negotiation, political economy, power structures, and the reproduction of hierarchy, race, representation, resistance, spatialities, technologies, and voice. CHS privileges some of these interests more than others and adds other concerns particular to it, such as cultural rights and human rights. Fundamentally, CHS examines "how power, identity and knowledge intersect with the practice, interpretation, display and management of cultural heritage" (Baird 2010). Harrison and Linkman pithily define the scope of CHS as "understanding how heritage functions in societies and the relationship between heritage and power" (2010: 77). Basically, CHS investigates top-down/official and bottom-up/unofficial processes and the relationship between them (Harrison 2010a: 8–9). A CHS approach reveals competitive intersections of power (political, economic, other), knowledge (monopolized/shared, authoritative/avocational), discourse (official/outsider), and interest groups (professional, international, national, popular, other).

CHS is sensitive to those who typically receive inadequate attention from the wielders of power. CHS recognizes the different and often contradictory understandings of the nature, ownership, value, meaning, and significance of heritage that are held by official interlocutors and unofficial sectors of the population. It attends to the varied ideologies and economies that underlie the uses of heritage. For instance, CHS responds to the commodification of heritage by the tourism industry and its nation-state partners. CHS valorizes non-Western as well as Western approaches to heritage conceptualization and practice. CHS considers the range and vast differences in scale of intangible heritage while retaining interest in the tangible manifestations of heritage that are well represented in heritage research. CHS advances the discipline of archaeology – so prominent in the heritage field – from its traditional interest in sites and monuments (the ultimate tangibility) to the inextricably associated intangibilities of the past and present.

Key Issues

Knowledge Brokers

CHS is very interested in institutional and vernacular decision-making as this reveals and enacts relations of power and domains of knowledge. CHS interrogates unofficial expressions of heritage and different (including non-Western) practices of heritage preservation (e.g., Karlstrom 2005), management, and promotion, including how these, at the local level, challenge official prescriptions and representations. Thus, CHS eschews authoritative positionality (e.g., Smith 2006).

Governance

Governance is the capacity of non-state organizations to accomplish something without the legal competence that states have to command their fulfillment (Czempiel 1992: 250). Instead, global governance may draw on moral power to advance its agenda. Global governance is of particular interest for CHS because it characterizes entities like UNESCO. Kirshenblatt-Gimblett observes that UNESCO's "World Heritage is one of several ways of envisioning and constituting a global polity. The goal is an active cosmopolitan citizenry" (2006: 189). But that global citizenry actually has little say in global cultural governance because of the monopoly of decision-making and lack of transparency in UNESCO's World Heritage Committees.

The authority of UNESCO itself and of national heritage institutions is being challenged intellectually by CHS scholars and also on the ground by a new form of heritage organization: the independent global-reaching heritage NGO that is unencumbered by the bureaucratic and diplomatic baggage of the United Nations/UNESCO and has its own private sources of financial capital. NGOs occupy an interesting intermediary terrain as knowledge brokers for they operate outside the self-policing of academic peer review and professional societies. The World Monuments Fund and Global Heritage Fund are exemplary as heritage NGOs. They have created a community of heritage-sympathetic individuals and sponsoring foundations. They are able to contract talented practitioners from the necessary disciplines to go into a country and, commando-like, tackle a perceived problem.

Following a recent discussion by Kate Clark (2008: 92), the following principles of heritage governance fall fully within the CHS agenda:

- Enable multi-sector participation.
- Formulate a strategic vision that encompasses human development and take into account historical, social, and cultural complexities.
- Insist on responsive performance by institutions.
- Maintain transparent accountability to the public and all stakeholders.
- Practice fairness involving equity and the rule of law.

The Contribution of Legal Scholars to CHS

A number of talented legal scholars are working within and advancing the CHS framework. Rosemary Coombe (2010), for instance, explores the global legal geography of cultural rights and cultural property as framed by international legal documents of a compulsory nature as well as various forms of "soft law" that recommend or proscribe certain actions. She explicitly unwraps neoliberalism as the context in which heritage operates and correctly argues for the inseparability of tangible and intangible heritage. Coombe recognizes new forms of social organization and their expression in social movements. Here we see CHS attending to the grassroots but with keen awareness of the significantly larger processes and agents in whose context they act. Other lawyers include Yvonne Donders (2008, 2009, 2010), Ana Filipa Vrdojlak (2009), and Jane Anderson (2009).

Heritage as Performance and Process

Whereas much previous heritage scholarship approached its object of study as fixed, something that can be apprehended because it is "there" (whether tangible or, more recently, intangible), CHS emphasizes the dynamic process of heritage production and the vernacular performativity of heritage. CHS denies the separability of tangible and intangible heritage. As David Crouch

observes, "heritage is continually emergent in living" (2010: 57), what he calls "perpetual performance," which is intrinsically related to cultural practice or the practice of culture in a Bourdieuian sense.

Festivals are an obvious example of heritage as performance and process (Kirshenblatt-Gimblett 1998; Harrison 2010b). Some formally staged performances in the tourist circuit are also very interesting to CHS scholars, especially when the nation-state or other official entity expresses interest in them or exerts control (see Bruner 2001). This is because "choices in repertoire and style are ideologically charged" (Kirshenblatt-Gimblett 1998: 65).

Memory and Landscape

Memory and landscape are at the heart of many diasporic heritages. Landscape – physically, socially, and cosmologically constructed – grounds heritage. Moreover, some landscapes are imbued with tragedy: a "heritage that hurts" (e.g., Sather-Wagstaff 2011) and places of pain and shame (Logan and Reeves 2009). Keller gives the example of geographies of memory and identity under conditions of migration and diaspora in the Melanesian archipelago, whereby "the heritage principles derived from emplaced community life are clearly still relevant… as generative principles embodied in memories subject to transformation and relevant to forming new dispositions and principles of habitus" (2009: 143). Fennell observes of memory that a "particular social group's construction of their cultural heritage often entails a selective emphasis on specific subjects within their history. The selective process of heritage construction includes instances of elision and omission as well as those of remembrance and commemoration" (2009: 149).

Heritagescapes

Across a range of disciplines, we are now awash in *scapes*, beginning with the social constructivist reengagement with *landscape* (e.g., Cosgrove 1984) and especially since Appadurai's (1996 [1990]) proposal of five dimensions of global cultural flows – all *scapes*: *ethnoscape*, *mediascape*, *technoscape*, *financescape*, and *ideoscape*.

It was inevitable that *heritagescape* would be coined (see Garden 2006). Among the many uses of the term today, Mitchell and De Waal (2009) define heritagescape as a landscape of historical buildings cum amenities, a place of commodified heritage. Here we have awareness of the economic forces driving heritage construction (literally and figuratively). Their work resonates with earlier studies of the manufacture and consumption of heritage (see, e.g., AlSayyad 2001).

Michael Di Giovine (2009) analyzes the *heritage-scape* that UNESCO has created, deploying the term in hyphenated form with the full weight of Appadurai's disentanglement of globalization. He asserts, correctly, that UNESCO is engaged in an "ambitious placemaking strategy designed to rearrange the geopolitical landscape into a reconceptualization of the world… the heritage-scape is a real social structure which creates real material effects on a globally distributed population in accordance with UNESCO's long-term goals" (2009: 6). This apprehension becomes a new point of departure in CHS.

Activism

CHS challenges the material-based notion of heritage in favor of recognition of public or community-based assertions of heritage and history (Waterton and Smith 2009). Heritage is not simply past looking, building upon dead remains excavated by archaeologists, be they grand or small. The issue is what living people *do* with those remains in the present, working toward the future. Indeed, criticizing the old model of heritage as material, Denis Byrne argues for "a new model: heritage as social action" (2008: 162; see also Harrison 2010b).

Not content to remain in the theoretical sphere of "studies," CHS has an activist dimension that builds, for instance, on applied anthropology's laser focus on real-world problems of race, gender, class, knowledge, political power, and the naturalization of discursive and embodied privilege. Examples include the work of Australian colleagues with Aboriginal communities (Davidson et al. 1995 inter alia), "teaching archaeology as a revolutionary act" (Pyburn and Sheperd

2005), and African American community mobilization (McDavid 2004; Mullins 2004).

The archaeology of the contemporary past is the study of the present as the present in terms of its materialized pathologies of class, race bias, economic disparities, conflict, labor, and human rights – issues of great importance to any engaged person today. The papers collected by Rodney Harrison and John Schofield (2009) and Larry Zimmerman's (Zimmerman and Welch 2011) work on the archaeology of the homeless are remarkable for their incisive and unflinching treatment of these issues, so different from the usual past focus of archaeologists.

Future Directions

Although the theoretical pendulum swings cyclically in the humanities and social sciences, in the case of CHS it is difficult to believe that this perspective will recede, since lack of attention on the ground to its concerns has resulted in too many multiparty heritage confrontations or deficient heritage management decisions, whether tangible or intangible in focus.

CHS has demonstrated that heritage is not a monolithic project. Rather, heritage should be conceived as an arena where "various issues are debated, negotiated, fought out, forced and manipulated by representatives" (Strauss 1991 [1978]: 124). Although not all participants have an equal voice, the opening of CHS is a dramatic advance in heritage studies and, to an increasing degree, heritage practice.

In decades past – as is well documented in early heritage instruments (conventions, charters, declarations, etc.) – heritage was an extremely limited arena with few participating social worlds. Indeed, it was the realm of architects and conservators, particularly. As living culture came to be regarded as part of the built heritage, the social worlds expanded, but it has taken a long time for primary cultural stakeholders – the communities – to be meaningfully involved. CHS will be more focused on the intersections of macro, midrange, and micro levels of social worlds.

CHS will increasingly involve institutional ethnography, particularly of NGOs and their relationship to the national entities charged with the care of cultural heritage (tangible and intangible) and to the local stakeholders whose heritage it is. This focus also speaks to the increasing scrutiny of UNESCO and heritage policy overall by CHS scholars.

CHS scholars will not just write about their discomfort with the purveyors of "authorized heritage discourse" (Smith 2006), they will increasingly demand to be heard in practical terms.

Attention to cultural rights, human rights, and cultural property/intellectual property rights will grow in importance. Issues of environmental heritage and the biological environment in which heritage operates will also become significant in CHS. Bioprospecting is an example (see Pan 2006).

CHS will increasingly focus on the economic and social dimensions of sustainability in the face of tourism's linkage with economic development and its propensity to consume vernacular life and its meaning-laden built environment.

CHS will become particularly concerned with historical discourses of citizenship and their evolution into new discourses, as well as with reconfigurations of citizenship in the current global world order. An important aspect of this issue is networked technologies of citizenship and their relationship to democratic movements and the generation of individual and collective subjectivities (see especially Stevenson 2003). We need to attend more to new social, cultural, and political forms of participatory heritage.

Western and especially Anglophone scholars dominate international academic forums on cultural heritage. If CHS is to be true to its own stance, it will need to more actively engage with non-Western scholars and heritage practitioners who may hold very different notions of what heritage, heritage studies, and heritage management are. Since its creation in 1986, WAC (World Archaeological Congress) has striven for equitable incorporation of colleagues and viewpoints from outside the dominant countries.

As the context of heritage studies changes, so, too, does its empirical focus and theorization. Today's transnationalism, multiscalar politics, and multidimensional and diasporic societies call for a different kind of research and fieldwork than that of the traditional community ethnography, richly nuanced though it has been. The situation of heritage today is so complex that its investigation and professional practice must be multisited, transdisciplinary, and longitudinal – involving the historic, present, and future study of culturally diverse local communities, regional governments, national offices, public policy, foreign players, and their networks and discourses. Archaeologists are increasingly subscribing to the CHS agenda.

Ultimately, CHS should produce not just academic scholars but also public practitioner-interlocutors who can advocate before an audience beyond university walls and directly engage policy makers.

Heritage Tourism and the Marketplace

Lyn Leader-Elliott
College of Humanities, Arts and Social Sciences, Flinders University, Adelaide, SA, Australia

Introduction

Tourism destinations attract visitors for many reasons, and heritage is high on the list of things many travelers want to experience. Visitor expectations about the nature of the place and the experiences they will have there will be set in advance of their visit, based on what they have read, seen, or heard.

Successful tourism at heritage places must incorporate regard for heritage values and integrity. Through marketing, it must create accurate expectations of the nature of the place and the experiences available to selected groups of potential visitors (target markets). These experiences should be designed to engage visitors with the place, and help them understand its meaning. Host communities should be able to collaborate actively in both heritage management and tourism activities (ICOMOS 1999, 2008).

The heritage tourism marketplace is global but product and consumer bases differ at local level, depending on the nature and location of the heritage place and the potential market segments it might attract. Understanding of both domestic and international expectations and markets is increasingly important as use of electronic and social media expands along with globalized tourism (European Commission 2009; Govers and Go 2009).

Balancing these potentially conflicting elements to achieve outcomes that meet heritage, community, industry, and customer needs poses continuing challenges.

Definition

Heritage tourism includes both production and consumption of "experiences" based on places

or collections with heritage or historic value. This value need not always be formally recognized in official heritage lists, but is realized at community level. It often includes intangible cultural elements as well as material culture. The "marketplace" in this entry refers to the global tourism marketplace.

Key Issues

1. Destinations and attractions are the product component of the tourism marketing mix (Ritchie and Crouch 2003; Pike 2008). Heritage attractions are part of the product mix of destinations, and include interpretation centers, shops, thematic reproduction, trails, and staged events, as well as the original site, place, or collection.

   In some cases, sites can be such strong attractions that they create destinations (Timothy 2011: 276–7). Sites like these usually have World Heritage status, like Machu Pichu (Peru), Angkor Wat (Cambodia), Pompeii (Italy) and Uluru (Australia). Most cultural heritage sites, however, act as attractions for destinations that people visit for a variety of reasons. In this case, they compete with all other attractions in that destination, as their destination competes with all other destinations

   Images of destinations and attractions are projected into marketplaces through a wide range of media. They are the vehicle through which destinations compete in the marketplace (Pike 2008: 201) and are central to branding and positioning. Visitor expectations of what a site will offer are frequently set well in advance of the actual visit, and their behavior on site reflects those expectations.
2. For any product to succeed in a marketplace, it must set itself apart from its competitors (Pedersen 2002: 53) and convince potential customers to prefer it over others. Where the attributes of an attraction or destination are very strong, these can create the necessary points of difference. Heritage classification is often used as a point of difference, and World Heritage listing is particularly valuable as a visitor attractor.

   In heritage tourism, the heritage values of the place should form the basis of its distinctive difference. Once heritage values are identified and accepted by stakeholders, they can become a springboard for planning appropriate tourism experiences and activities. Such experiences of the visitors are often used as market differentiators.

   Frequently, this does not happen. For instance, Uluru is a sacred place for the indigenous people of central Australia, who strongly prefer that visitors do not climb the rock. Yet many tour companies develop itineraries featuring "the climb" as the essential experience at Ayers Rock (the preferred tourism marketing term for Uluru) rather than taking a tour with an Anangu guide who can give unique insight into some of the meanings of the Dreaming site Uluru.
3. "Authenticity" is often used as a selling point, but tourists are often seeking a sense of "otherness" rather than authenticity per se (Timothy and Boyd 2003: 239–55; Timothy 2011: 103). The concept of authenticity itself is constructed differently in the tourism and heritage sectors, (Wang 1999; Smith et al. 2010) and in different parts of the world. Tourism, for instance, is likely to focus on the "authenticity" of the visitor experience, which may mean a tour is led by local guides and local food is served at meals. For heritage managers influenced by western paradigms of heritage, their main concern is likely to center on integrity of physical fabric, but in Asian cultures like Japan, there is no such concept as authenticity (Winter 2009).

   It is never possible to recreate the past accurately, nor to offer a single version of heritage as the only one that is true or authentic. Using an informed understanding of heritage values offers a path toward honesty in presentation, if not authenticity.

   The need for visitors to enjoy themselves, to have a positive experience, is likely to be paramount for a tourism operator, and that is what they will promote. If cultural and heritage

values are not to be compromised through tourism, heritage managers need to be able to convince tourism operators that it is in their interest to offer and promote an experience that relates to the heritage values of the site.

4. Selection of elements of heritage for tourism promotion is political, in the sense that it favors some histories over others (Timothy 2011: 118–39) and can be contentious (Graham and Howard 2008). Representations of the past are always selective and subjective. The reductive processes of branding and positioning for marketing aim to arrive at a simple, clear statement. "Honest" representation of heritage and culture through marketing is bound to be problematic because complexity and multiple voices are difficult to convey accurately in a way that will entice visitors.

   As Graham and Howard (2008: 13) note, "[when] heritage place meanings are contested, communication, and control over it, are potentially powerful weapons." For many countries, heritage which is closely linked to cultural and national identity is their main tourism selling point. Often, heritage tourism operators need to consider whether they will reinforce a national position or interpretation of the past. The following questions are raised:

   Which strands of heritage are chosen for representation and promotion? Are representations accurate? Do they create or reinforce stereotypes of past events and groups of people, for instance, of different races, classes, or religious faiths? Will minority views or unpleasant events and memories (such as war, slavery, massacre) be represented? Whose viewpoint will prevail? Which aspects will attract money for development? Which elements will attract paying visitors? How will these factors influence decision making? Baram and Rowan (2008) and Hitchcock et al. (2010) put forward case studies examining these and related questions in Asia, Europe, the Middle East, and North and South America.

5. Potential markets for heritage tourism vary with nature of the product and the experiences it offers at a location and with the demographic and psychographic profiles (values and interests) of potential visitors. Visitors have different interests, motivations, behaviors, and desired experiences – for instance, somebody traveling to visit cultural monuments will have quite a different motivation, set of expectations, and likely behaviors than someone who visits the same monument but is only incidentally there (Pedersen 2002: 24).

   To enhance their competitive position in the cultural and heritage tourism marketplace, many governments and industry associations carry out research that identifies their target markets and potential matches of different types of product with different market segments. For instance, the Canadian Tourism Commission (2002: n.p.) "identified culture in its broadest sense as a key component of the tourist industry" and began to work on a business strategy to "position culture and heritage as a key product line for Canada's tourist industry." The New Zealand Government commissioned a report on the demand for cultural tourism in that country (Angus and Associates 2008). Both these reports analyzed their potential cultural and heritage tourism product, and the market segments to which these products might successfully be promoted. The European Commission (2009) has also published research that identifies potential markets for cultural and heritage tourism product.

Heritage values and the tourism marketplace have the potential to conflict at many levels. Heritage specialists, marketers, communities, and product developers need to work together to meet the needs of the site, its visitors, and host community.

Heritage Valuation: Paradigm Shifts

David W. Morgan
National Park Service, Southeast Archeological Center, Tallahassee, FL, USA

H

Introduction

The heritage preservation movement in the United States has traditionally focused on tangible, physical resources – real property – as its anchor to a concept of national heritage, with language about intangible heritage values finding footing in more recent years in National Park Service Preservation Brief 36 and National Register Bulletins 18, 30, and 38. The historical development of this unique preservation movement and how heritage resources have come to be valued and managed are well documented (e.g., Murtagh 1997; King 1998; Tyler 2000). In short, there were several major paradigm shifts in the early years of the preservation movement. What began as a wealthy women's grassroots movement intended to enshrine colonial patrons shifted over decades into the domain of sociopolitically elite philanthropists. It then evolved into a federalized bureaucratic system in response to the Great Depression and, later, in reaction to destructive federal transportation and housing programs launched in the mid-twentieth century. This entry is an overview of an additional transformation that has occurred in the decades since the 1960s. Specifically, this entry asserts that the civil rights movement coincided with a rise in a multi-vocal interpretation of the past, which largely overwhelmed the notion of a monolithic national patrimony, and the response in the last three decades was to emphasize stakeholder

power and community-level heritage valuation. The result was a pendulum swing from the definition of heritage value by affluent, sociopolitical gatekeepers to a much more democratized practice of historic preservation.

Definition

Heritage valuation is simply the process by which stewards – ranging inclusively in scale from governments to local community members – attempt to assess, identify, and specify what it is about a particular place on the landscape that gives it cultural significance and meaning. It reflects an understanding that values are mutable, multifaceted, and open to divergent interpretation, and that heritage resources have both historical depth and contemporary meaning.

Historical Background

More than a century since its inception, heritage valuation in the United States is now codified in more than a dozen laws, regulations, and presidential executive orders, and is measured in the coin of national patrimony. Arguably one of the most influential laws in terms of fiscal and preservation impact is the *National Historic Preservation Act* of 1966 (NHPA; PL 89-665). The NHPA, among other things, established the National Register of Historic Places and placed it under the administration of the National Park Service (16USC470[a]). The law was passed to ensure that resources significant to national heritage and exhibiting a certain "quality of significance" and "integrity" would be preserved (36CFR60). Such resources were defined strictly as "any prehistoric or historic district, site, building, structure or object included in, or eligible for inclusion on the National Register" (16USC470[w][5]). In advance of destructive federal projects, it is only properties listed on or eligible for listing on the National Register that are afforded consideration to determine whether their preservation or destruction is in the public's best interest. An entire private sector enterprise – "cultural resource management" – has arisen in response to the NHPA and other relevant preservation law, with parallel responses in the government sector and with theoretical grounding in the academic world.

Key Issues/Current Debates

The National Register and its associated guidelines have at times had difficulty reconciling the interwoven areas of stakeholder consultation, community-level resource valuation, intangible resources recognition, and national documentation. Major preservation interests in the United States have in recent years begun to grapple with these issues, responding to calls to reconcile the national recognition system with more democratic, grass roots understandings of what it is that gives heritage resources and places their value. A shift seems to have occurred in the late 1980s and 1990s, in which community-level valuation of these resources by ordinary people began to penetrate the traditional preservation practice of commemorating patrimonial icons.

International Perspectives

Several historical trends in different arenas – academic, economic, and social – have converged to make such a paradigm shift possible. One trend is for the deconstruction of the notion that there is "a" national heritage, largely as a consequence of the activism of descendant communities during and after the 1960s civil rights movement. Accepted national stories, such as how the west was "won" or how enslaved people were treated on plantations, were questioned, contested, and sometimes recast. Even the primacy of Western epistemology, including notions of "property" and "ownership," has been challenged by indigenous belief systems that view cultural objects and society as inextricably entwined (Ziff and Rao 1997; Warren 1999). Native Americans in the 1960s and 1970s were especially vocal, and their perceived connection with the natural environment made them key players in the evolution of cultural resource management (King 1998: 16).

This position enabled them to advocate strongly in the 1980s for federal recognition of "intangible" heritage values. Ultimately, they influenced the NHPA by means of an amendment in 1992 that specifically identifies properties of "traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization" as eligible for the National Register (16USC470 Section 101 [d][6]).

The National Park Service issued National Register Bulletin 38 in an effort to illustrate how traditional cultural properties were to be identified, assessed for significance and integrity, and considered for inclusion on the National Register (Parker and King 1990). Significantly, the authors of Bulletin 38 identified community stakeholders as the only people with the ability to recognize and evaluate the value of these types of resources, but reversed themselves to make stakeholders' opinions subject to validation by cultural anthropologists, i.e., "outside experts." One of the unintended consequences of the guidance thus was to highlight issues of authenticity, authority, and cultural legitimacy and their gatekeeping roles in the national heritage documentation system. Gatekeeper controversies and how to surmount the sociopolitical realities embedded historically already were a part of the traditional preservation conversation, and the new bulletin expanded that dialogue significantly, even if unintentionally. Consider, for instance, the highly visible and controversial "Chumash Debate" that transpired in the 1990s in cultural resource management and academic circles (e.g., Haley and Wilcoxon 1997). A series of critiques emerged and centered around the notion that at some level, arguments about the authenticity of indigenously identified traditions are a subtext for continued arguments over imperialism, sovereignty, and power. These discussions held that federal preservation law fosters the notion of a static past that is incompatible with the anthropological notion that change, fluidity, and situational boundaries are the sine qua non of culture.

Similar debates also arose that were centered on resources of value to other communities (e.g., places of African-American enslavement, Japanese American prisoner internment camps, and other "sites of conscience"), and the challenge to resource valuation grew. The recognition of subaltern histories and contradictory, competing interpretations of "patrimonial" icons became a primary concern in the traditional preservation community. Consider, for instance, the promulgation in 2004 of the *Ename Charter for the Interpretation of Cultural Heritage Sites* by the International Council on Monuments and Sites (ICOMOS), which was ratified in 2008 and called for interpretation of contested viewpoints. Gustavo Araoz (2006), then executive director of U.S. ICOMOS, explained that although "the international heritage community has managed to get by without detailed guidance on how to articulate a site's significance to the general public," there was a need for a new set of ethical principles based on the recognition that there are no unchallenged, uniformly accepted stories within a pluralistic democratic society. In summary, the empowerment of indigenous communities as part of the civil rights movement gave them the means by which to challenge the notion of a homogenous national patrimony, which indirectly challenged the idea of a homogenous national recognition system.

In addition to multivocality, another trend that has converged to promote a paradigm shift in heritage valuation is the growing recognition that, with few exceptions, the developmental trajectory of historic preservation in the United States has resulted in the exclusion of places that give specific communities their particular identity – sense of place. Sense of place is the connection between people and the places they repetitively use, in which they dwell, in which their memories are made, and to which they ascribe a unique feeling (Morgan et al. 2006: 706). Historic preservation in the national context has excluded the commonplace and the seemingly inconsequential markers on the landscape that anchor people to what they call home, and to what they identify as their heritage. This became poignantly clear in the aftermath of Hurricane Katrina in 2005, when local communities on the central Gulf Coast questioned the value of a federal commemorative system when it was not individual icons but an entire "sense of place" that was

endangered (Morgan et al. 2006). Preservationists were obliged to reconsider exactly what it is that our federal system documents and how effective it is at helping communities preserve the places important to them. Seemingly ordinary places underrepresented in the federal system can be as important to the people who live among them as the properties that preservation "experts" deem worthy of the National Register. That the gap between community sense of place and National Register placement did not come into sharp relief sooner suggests there is an institutional misunderstanding about what makes heritage resources valued in local and community contexts.

Additionally, the globalization of national communications, economics, and politics in recent years has strained notions of community identity. Randall Mason (2006) places the impetus for a paradigm shift in resource valuation in what Andreas Huyssen (2003) termed "memory culture." The last decade, Huyssen asserts, represents a time of innovation in how society deals with memories of its past, a crisis response catalyzed by "deep, fundamental dislocations in society caused by mega-trends like globalization, regional economic transformations, post-colonial policy shifts, migration, and the influence and reach of the media" (Mason 2006: 26). Memory culture, says Mason (2006: 28), "demands a different sort of preservation practice, in which preservationists' traditional focus on materiality is augmented by means for dealing with different cultural interpretations, competing political demands, and economic influences," which he dubs values-centered preservation.

Future Directions

Internationally the shift in heritage resource management toward decentralization and toward the placement of management and valuation into the hands of stakeholders is well under way (e.g., Mitchell 2003; Phillips 2003). In the United States, the practice of resource management suggests that what the American people value about the past is changing. Evidence may be seen in the explosive growth of National Heritage Areas: a grassroots, decentralized management strategy anchored on the concept of community sense of place, with valuation and management both at the local level (e.g., Barrett and Carlino 2003; Barrett et al. 2006; Morgan et al. 2006, 2010; Morgan 2010). It is also evident in the rising interest in historic highway corridors and historic trails, and in professional discourse about heritage values. The latter includes recent Preserve America Summit proceedings held by the Advisory Council on Historic Preservation (2007a, b), and a round table discussion at the National Trust for Historic Preservation annual meeting in 2007. Discussions at the Preserve America Summit, for instance, were oriented formally around stakeholder and intangible heritage value issues, and panels of distinguished preservation practitioners urged the Council to attempt to merge "places presently protected informally by cultural groups in the greater protection of the NHPA," with resource evaluation beginning with the stakeholder (Hutt et al. 2007: 1).

From these, we glean a sense that what ordinary citizens value about the places they hold dear is much more expansive than what is currently encompassed by traditional historic preservation. That which is valued tends to include modified and unmodified aspects of the landscape; encompasses living and diverse communities, along with their cultural traditions; is centered on people and sense of place rather than historic "fabric" alone; and connects people through their heritage via the act of narration. In short, preservation has belatedly embraced its overlap with cultural anthropology as it shifts the locus of its efforts to contemporary communities of local people. Stakeholder participation must rest at the heart of any documentation and preservation system that tries to capture sense of place at a local level.

Heritage Values and Education

Melanie Coughlin Depcinski
Department of Anthropology, University of South Florida, Tampa, FL, USA

Introduction

Heritage is a complex topic that has critical relevance to social, cultural, and national issues around the world. In general, heritage professionals seek to document, preserve, interpret, and promote heritage stories on local and global levels. There are many complex issues involved in this work. For example, how does one interpret the heritage of the past, the present, their own heritage, or the heritage of others? More importantly, how do heritage professionals responsibly distribute this information to the public once it has been created and interpreted? This section examines how researchers in a wide variety of academic fields have studied heritage and how these researchers struggle to negotiate heritage in an increasingly globalized world.

Definition

The nature of its existence necessarily means that heritage is a difficult concept to identify in concrete terms. Heritage has a wide range of meanings and interpretations throughout the world and can hardly be defined in a way that would be appropriate for all of its applications. However, it is possible to consider some of the key issues that surround the idea of heritage. Identity, memory, and sociocultural values all contribute to how heritage is understood and interpreted (Smith 2007). While it may seem that heritage is necessarily synonymous with culture, the two concepts have very different aims in what they seek to describe. Heritage is the conglomeration of cultural or ethnic practices, beliefs, and expression throughout time. Although culture is absolutely necessary to understand heritage and it is very often the case that heritage helps in the understanding and formation of culture, both heritage and culture must be taken in their own contexts and then considered in relation to one another rather than as a single entity. Heritage and culture are not so much two sides of the same coin as they are different variations of social currency that influence one another heavily.

Beyond looking at manifestations of culture that include music, dance, art, architecture, language, religion, mythology, and/or folklore, heritage as a concept also represents the impressions, reactions, and the formation of ideas that come from interactions with each of these forms of cultural expression. Also at issue is whether heritage is purely a construction of those who recognize some notion of the concept for themselves or if heritage is constructed from the outside. Some could argue that the answer to this question is a combination of these two ideas. Heritage is not only the connections to the past that are recognized by a particular cultural group but also the characteristics assigned to the interpretation of these connections from those on the outside. It is from this point of view that key studies into the misinterpretation or "silencing" of cultural heritage come into play, an issue that will be discussed further in this entry (see Trouillot 1995).

Although heritage cannot be easily defined, the ways in which researchers have considered heritage in their work can lend to an understanding of the concept's scope. Valene L. Smith's highly influential book, *Hosts and Guests* (1977), catalyzed the analysis of cultural tourism within the

context of anthropology and ultimately influenced the study of heritage for the next three decades. In subsequent editions, Smith's view of heritage places the identification of the concept firmly in the hands of the cultural group. What this means is that the members of the group are the ones that claim association with a particular cultural tradition and are the ones who determine how this tradition is made available to an audience outside themselves (Smith 2001a). Furthermore, Smith carefully asserts that heritage is not history. Rather, heritage is the result of cultural groups adding value to the interpretations built from historical fact (Smith 2001b). It is clear from the evolution of the discussion of tourism and culture in her work that heritage grew as a focal point for tourism studies from the 1970s through to present-day studies of the concept.

The consideration of heritage in relation to tourism typically necessitates a commoditized view of heritage. Barbara Kirshenblatt-Gimblett (1998) views heritage as a new concept that works to connect the past to the present with the result of a new cultural interpretation of the past. Where some authors acknowledge a relatively narrow view of what heritage means, others explore the meaning of the concept in broader terms. In his book, *The Tourist Gaze*, John Urry (2002) grapples with the idea of what heritage is – or how it evolved – and examines how it has been folded into the tourism industry. He considers the many embodiments of the concept: heritage as a commodity constructed by the state, as fantasies about history, as artificial stories meant to entice the imagination into connecting with the history of a region, or as a result of public nostalgia and the need to tie together preservation efforts and public interest. In Urry's (2002) treatment of heritage, it seems that heritage displays as representations of history fail to properly encompass the social processes necessary for understanding the past on display. Thus, while heritage exists outside of historical fact and functions as a story about what took place during a particular time, the perception of what has taken place relies on the interpretation of facts rather than on the facts themselves. This interpretation is ultimately what is meant when heritage is discussed in present-day contexts. Erve Chambers (2000) also examines heritage through the lens of the tourism industry. Rather than focusing on heritage as the product of past cultural or historical expression, Chambers characterizes heritage as the history and cultural connections to the past that groups – in this case, indigenous groups acting as hosts for tourist engagement – recognize and embrace as part of their cultural story. The performances and simplistic representations of these stories are commoditized manifestations tied to the intersection of heritage and the tourism industry and not manifestations of heritage in and of themselves.

Looking beyond heritage in the context of tourism, authors such as Laurajane Smith and David Lowenthal characterize heritage as tangible and intangible links to the past, whether these links are manifest in the form of place, material culture, or other culturally significant connections to a shared past. Smith (2004, 2007) considers heritage in association with identity formation and how indigenous communities and professionals who view manifestations of heritage as data interact with one another. Lowenthal (1998) succinctly characterizes heritage as anything that has been handed down from the past, yet carefully ensures that heritage is understood as distinct from history. As both authors show, heritage and environment are inextricably linked, as are heritage and history, and these links are the foundations for the cultural stories that develop into the heritage product. Though these considerations of heritage are not particularly unified, they do point to an effort to broadly characterize heritage and heritage studies rather than constrain the concept to a single definition.

Historical Background

In the last several decades, the study of heritage has blossomed as both an anthropological and archaeological topic. The discussion of cultural heritage in an anthropological context has been building in importance and frequency since the late nineteenth century with a marked rise in relevance in the final decades of the twentieth century (Smith 2007). The past 75 years have been

particularly formative for the theoretical, methodological, ethical, and professional underpinnings of cultural and archaeological heritage issues. Until recently, heritage studies were focused largely on the technical matters of conservation, preservation, and management. It has taken this long period of development for heritage studies to be considered in a more sociocultural context (Harvey 2001). As has been discussed, heritage is not an easy concept to define but can generally be taken as a way cultural groups link the past, present, and the identities and connections formed from this link.

For centuries what we now refer to as heritage was a deeply meaningful but un-termed connection to the past that was inherent in cultural and personal identities. Serious academic consideration of heritage as an anthropological and archaeological topic took hold in the 1980s and 1990s. Since its inception, the concept of heritage has been viewed from a number of theoretical and academic perspectives. Cultural heritage as presented in the museum was the earliest manifestation of heritage for the public and was thus the aspect of heritage that was first considered by researchers. Discussions of display eventually gave way to the global showcasing of heritage and how it fits in to the globalization and the spread of culture that can be connected to the dawn of the mass tourism industry in the 1970s. With the increased engagement with physical manifestations of heritage – architecture, artifacts, and monumental remnants of the past – it has become necessary to consider how these objects and spaces can be protected while functioning to educate the public on their origins and uses. While exhibition and public access to sites and monuments are some of the key ways in which the public is educated on both the heritage of their own cultures and the cultures of other groups, these exhibitions are inherently taxing on the integrity of the object, if not destructive. Thus, the intersection of technology and heritage has gained relevance for researchers as it is becoming necessary to present tangible and intangible heritage digitally in order to preserve and protect this important resource (Pozzi and Ott 2011). This recent and innovative avenue of research coupled with issues of globalization, identity formation, agency, and community involvement makes up the contemporary format of heritage studies as it functions across disciplines today.

Key Issues/Current Debates

The distribution of heritage to the public is a complex process fraught with challenges and opportunities. Michel-Rolph Trouillot's work on "silences" is a key example of how heritage presentation can have both positive and negative outcomes (1995). In this work, Trouillot considers that heritage presentations do not always encompass the whole story. Rather, the truth in matters of history and heritage is bypassed by the narrative's presentation as a result of the power and authority that the narrative carries. The silencing of cultural history has to do with the power that competing stories have. This can mean that the most powerful faction, the group with the ability to make their voice heard, tells the story and effectively silences other interpretations of heritage and the past or it could mean that a particular story is more interesting or economically exploitable than another that is equally valid, as is frequently seen in heritage tourism. One must always consider what the representation of one set of facts or ideas rather than another does to the viability of the alternative views regarding the story being presented.

The display of cultural and archaeological heritage in venues such as museums or heritage centers is the primary way in which the public encounters the materiality of heritage. Whether these institutions are utilized at home or abroad, their influence is no less profound. Museums give legitimacy and authority to the items on display within them, they carry a certain level of power that allows objects to be seen as outside the world as it is typically presented. In some cases, this has the result of items on display in this context being viewed as artistic expressions, rather than as a cultural item with tangible connections to people alive today (Alpers 1991). This view of "object as art" disconnects the material cultural heritage from the community that claims it, and audiences come to see these items as having little to no

relevance in the present. However, display can be used effectively to unite heritage stories with their objects, particularly as new technological methods for enabling interaction and engagement between museums, heritage centers, and their audiences continue to emerge (Pozzi and Ott 2011).

The issues of ownership and agency have recently gained primacy in the discussion of heritage. Community involvement in the interpretation of heritage and the production of heritage display has risen to a level of ethical necessity. Just as display influences how those who engage with heritage presentations understand the heritage on display, the process of interpreting heritage for display influences how it is understood. Those professionals who decide what the story is and how it should be told filter the information through their own perspectives and experiences before they arrive at the final representation of the heritage they are considering (Karp and Lavine 1991; Copeland 2006). Thus, it is necessary to involve communities in the interpretation of their own heritage. Agency and ownership are vital in the authenticity of the story. The telling of one's heritage gives individuals power not only over the story of their past but the identity that grew out of it. They are able to influence how other people see them and engage meaningfully with their past, and in many cases this can have a powerful effect on the community on both a local and global scale (Jackson 2009; Figueroa et al. 2012). When heritage professionals attempt to interpret cultural stories without the help of the communities who embrace them as heritage, they effectively change how the story is perceived. Rather than originating from those who hold the heritage story as part of their cultural history, it is filtered through an outside perspective and becomes distanced from those who hold that heritage as their own (Karp and Lavine 1991).

Though the problems involved with the presentation of heritage are many, they are not insurmountable. The distribution of cultural heritage in both local and global contexts can serve to help cultural groups tell their stories and promote a more culturally relative world. When community relationships are built between the heritage professional and those whose heritage is being presented, the community can directly benefit. Participating in the display of their heritage, and deciding what will and will not be made available to the public, gives communities control over how their stories are used in a present context. Heritage and the cultural past have been used for centuries to affirm rights over lands, inheritances, and identities, and this is no less at issue today. This discussion has been focused on heritage as an embodiment of the past and the connections that people make to their own perceived history. However, it is also necessary to consider the production of heritage as it takes place today. How does society protect what they feel will be important for future manifestations of the cultural patterns that are identified and adhered to as heritage? What is the legacy that is left for future researchers, archaeologists, and enthusiasts? How does our own interpretation of what is important about us now and in the past influence the way we think about our past, present, and future? The establishment of heritage for the future is one realm of exploration that has yet to be considered and is one that will undoubtedly make for intellectually stimulating dialogue as the conversation about heritage develops.

International Perspectives

Heritage concerns vary across national borders. While in some countries it may be important to ensure preservation of intangible forms of heritage or work closely with cultural groups who identify as living ancestors of past peoples, other countries place greater emphasis on preserving the built environment. The United States and Australia are two examples of countries where a close relationship with local groups is vital to understanding and responsibly interpreting and displaying archaeological and cultural heritage. In both cases, there are descendent communities whose concern for the integrity of their ancestors' property and remains outweighs the interest of the general public. In the Mesoamerican region, the relationship between the built heritage and the descendent community is tied so closely to the

tourism industry that much of the power involved in heritage presentation is in the hands of the government or foreign interests.

Heritage has been developed at an international scale to appease both local and global publics. As tourism ventures have become more accessible to people living around the world, so have the cultures in the areas to which tourists are drawn. Outside of the media, tourism is the largest heritage educator for the global audience today. Despite the fact that travel may not be a possibility for every individual who learns a cultural lesson as a result of tourism, the stories that travel with those who are able to leave their home cities and countries influence how heritage is learned and understood throughout the world. As the world becomes more globalized, so does the understanding of culture and heritage. Depending on the context in which this information is presented and the methods taken to ensure responsible public education, people will come away with different perceptions of the places they visit (Salazar 2012). This globalization essentially builds heritage identities that may not necessarily be those that are embraced by the cultures to which these identities are inscribed.

With the recognition of heritage as a valuable asset for knowledge and commerce, the international community has developed a concern for the protection of these resources to be appreciated on a global scale. Indeed, it has become the trend to protect and view natural, anthropogenic, and intangible heritage resources as the legacy of all people, not just those that live in the areas where the resources reside. In order to facilitate the protection of these resources, the United Nations and other world organizations developed programs to oversee the preservation and care of the world's heritage. The United Nations Educational, Scientific, and Cultural Organization (UNESCO), the International Council on Monuments and Sites (ICOMOS), and the International Committee on Archaeological Heritage Management (ICAHM) are three examples of organizations who strive to protect the world's heritage legacy. Where UNESCO focuses on a variety of global issues and works to protect and educate the public on both tangible and intangible forms of heritage, ICOMOS, which operates in association with UNESCO, focuses mainly on bringing together professionals that work towards the research and protection of architectural and archaeological heritage. The ICAHM advises ICOMOS on issues concerning the protection of both archaeological sites and landscapes with a focus on professional method and practice.

Although these organizations certainly do a lot for heritage resources throughout the world, it is important for heritage professionals and academic researchers to recognize that, though these organizations have an international focus, they are largely based in Western views of heritage and heritage management. This results in an organizational bias towards Western heritage management strategies and practices that are not necessarily applicable globally. While Western cultures have largely embraced the roles of organizations such as UNESCO, ICOMOS, and the ICAHM, non-Western cultures are beginning to lament the assertion of Western heritage values on their cultural properties and perceived heritage (Smith 2007). A reflexive self-analysis of the role that heritage professionals and interpreters play in the final representation of heritage has become a vital part of heritage studies. This same reflexivity needs to be applied to the discipline and to look more closely at non-Western considerations of heritage, what it means, and how it should be presented to the global public, if at all.

Future Directions

This entry considers heritage education as a complex process of interpretation and presentation. How archaeologists and anthropologists interpret heritage is always changing and is consistently influenced by the local stakeholders and public interests that are at play. Although individuals may construct and interpret a personal view of their own heritage, the heritage of the other is mediated by professionals who strive – typically from an outside perspective – to understand past cultural knowledge for the benefit of a global audience. Although a definition is elusive, it is possible to understand heritage as connecting the past and the present of cultural groups in a way that is meaningful for the formation of identity

and the mutual understanding of cultural differences and similarities in the world. Heritage is essentially an umbrella term for a variety of cultural expressions that link people to their past and present. Heritage can, and does, represent everything from material culture to intangible forms of culture, such as dances or musical expression. In order to ensure that the host culture is properly served, heritage professionals must be responsible in the ways in which they showcase heritage. One must always be acutely aware of audience, display, context, and, inevitably, their own biases, as well as their knowledge of the material they are attempting to disseminate to a wider public. Without this care and attention to detail, the public may come to know a heritage story that is either inaccurate or does not do justice to the wishes of the community.

Introduction

Safeguarding natural and cultural heritage is complex for many reasons, not least, determining what is important, to whom, and why. Inherent in the challenge is the engagement of a broad public. Fostering attachment and custodial responsibility for our patrimony, while ensuring heritage values embody the aspirations of sustainable futures in an inclusive and constituency-building manner, is not simple. Layered on this are the increasingly borderless and entangled realities of the "glocal" (Bauman 1998). Moreover, "heritage" and "identity" are contested, continually reconstructed, renegotiated, and subject to reinterpretation and to shifts in collective worldviews (Kirshenblatt-Gimblett 2004). ICOMOS acknowledges this slipperiness in Article 3 of the *Quebec Declaration for the Preservation of Spirit of Place*:

> A continuously reconstructed process, which responds to the needs for change and continuity of communities, we uphold that it can vary in time and from one culture to another according to their practices of memory, and that a place can have several spirits and be shared by different groups. (ICOMOS 2008)

This constancy of change and plurality of view are at the heart of numerous debates around heritage. Cultural migrations and blurrings are nothing new; however the speed of change is much greater, as is our awareness and sensitivity to what Bauman (2000) describes as "liquid modernity" where change is hyperconstant. Ongoing debates map tensions between conservation and development, between the developed and the developing world, between western and non-western views, between different cultural constructions of our connections to place and time, between global and local, and between Indigenous and non-Indigenous understandings among other deliberations on what is important and what "our" heritage means. These deliberations set in motion contestation around who should arbitrate on what is important, what should be protected, who should be entitled or empowered to make such decisions, and through what processes. To sensitively communicate heritage values, it is necessary to consider what agendas should be privileged; who is "authorized" to speak on behalf of particular places, histories, and understandings; who has agency and voice; and whose values are being communicated in these processes (Staiff and

Bushell 2003). These are significant ethical, philosophical, and pragmatic questions.

Defining the Topic

As noted heritage values do not lend themselves to simplistic definition. Heritage sites and places have both official and unofficial interpretation and visitor information, through visitor centers, Internet sites, guides, audio tours, guidebooks, and so on. With the democratization of mass communication and the exponential rise of electronic experience and idea sharing, various forms of social media are employed for the distribution of information and the experiences of place. Communicating heritage values entails processes of engaging and sharing with others, with place. Material should encourage an appreciation for both tangible and intangible heritages. The process of communication must be mindful of the complexity, and embrace the fluidity, and hybridity of both heritages and communities. Both are located at the interface of economy, place, stakeholders, history, and ongoing cultural productions. And so communications need to be sophisticated to be effective and to do justice to the values.

Key Issues

Many processes and relationships, social, political, and cultural, are in play, shaping views of heritage values. Contestations surrounding integrity and authenticity continue unabated and influence what should be valued, to be protected, and communicated as the embodiment of heritage. The *Nara Document on Authenticity* responded to concerns about *very* particular cultural views of how authenticity should be managed, protected, and understood. It states that:

> In a world that is increasingly subject to the forces of globalization and homogenization, and in a world in which the search for cultural identity is sometimes pursued through aggressive nationalism and the suppression of the cultures of minorities, the essential contribution made by the consideration of authenticity in conservation practice is to clarify and illuminate the collective memory of humanity. [Article 4]

The document continues. . .

> All judgements about values attributed to cultural properties as well as the credibility of related information sources may differ from culture to culture, and even within the same culture. It is thus not possible to base judgements of values and authenticity within fixed criteria. On the contrary, the respect due to all cultures requires that heritage properties must be considered and judged within the cultural contexts to which they belong. [Article 11] (ICOMOS 1994)

A nuanced framing is requisite to communicate such ideals to preserve the very local essence of these heritage values. This suggests moving away from approaches that treat heritage as though it were a tangible object that can be readily presented, represented, explained, and communicated. Attempts to do so through particular heritage "messages" – the triggers that curators, interpreters, and heritage professionals and bureaucracies hope will invoke passion and commitment toward heritage – are too often simplistic. Rather than a "takeaway message," given the complexity, is for any communication to open ongoing dialogue, through an engaging and empowering process encouraging personal connections and embodied responses; allowing a diversity of experiences, meanings, understandings, attachments, and purposes. Such processes should be designed to encourage greater opportunity for involvement from those who reside in and visit these special places, not keep the safeguarding, the rights, and the responsibilities for heritage specialists only. This would seem more appropriate, resonating with the democratization of communication and information sharing, allowing for a more subtle and personal sense of connection. The lead should come from communities working together to identify and protect that which is important to them – their heritage – and building civic pride, knowledge, and stronger bonds for the future (Staiff 2014).

The technological revolution has enabled everyone to be connected in real time to everywhere and everything. In this highly mobile and technologically linked world, places are not fixed

entities; rather they are sites of movement and change. The idea of "the expert," "the local," "the visitor," "the guide," and "the tourist" and the relationship of each to a place, and hence the relationships, connections, cultural productions, rights, and responsibilities toward the heritages of a place, are blurred, converging, and transformed by contemporary movements and mobilities (Bushell and Staiff 2012). Urry (2006) reminds us that within a place:

> There is no simple and unmediated relationship of subject and object, presence and absence. There is a haughtingness of place, through voices, memories, gestures and narratives that can inhabit a place for locals and for visitors (Urry 2006: vii).

Problems may occur as places are packaged and presented to visitors. Discursively constructed and selective representations of heritage places and landscapes through which particular narratives and images are appropriated, (re) produced, and (re)circulated may resonate with visitors who arrive with certain expectations created through online environments, travel shows, tourist brochures, and so on, but these same representations may alienate the "local," causing residents to feel like the stranger within the intrusiveness of the touristic performance of a place. It is incumbent on heritage site managers to consider the ethics of how heritage places are portrayed. However, visitation should not be positioned as a problem. Issues of scale, volume, and distribution of tourism pressures and the effects of commodification of heritage values worry many who consider tourism a threat to the integrity of the tangible and intangible heritage of many sites. Of particular concern are the most iconic and heavily visited such as small World Heritage towns which are increasingly attracting large numbers of investors, tourism operators, and visitors. Visitation therefore deserves more careful and holistic consideration, planning, and management. It is an important mechanism, not only for the financial support of heritage enterprises and regional economies but also for the presentation and transmission of heritage values to both local people and visitors. Well-managed tourism not only communicates and reinforces conservation values to local people, for many living in places with significant heritage, these sites are symbolic of hope. They can be catalysts of community development and, through improved education, can engage local people to advocate for the protection of their natural and cultural heritage. Conversely, poorly planned and/or not managed responsibly tourism can contribute, along with many other forces in play within all communities, to degradation and loss. It can create many negative impacts on the integrity of the material, the ambient, the cultural, and the spiritual, destroying sense of place and quality of life for associated communities.

While heritage sites are complex with multiple stakeholders, values, and meanings (Edensor 1998) contested by competing stakeholder groups (Owens 2002) and nodes where global forces converge, they are also the intrinsic elements of nation-building projects. Hence, the communication of heritage values needs to be seen in a much wider context than just the local.

Winter (2004) argues the importance of places being sites of living heritage, in which the past is significant in the formulation of "collective identity" (Edensor 1998), but these pasts should not erase the present. "[A]ll heritage interventions . . . change the relationship of people to what they do. They change how people understand themselves" (Kirshenblatt-Gimblett 2004: 58). This locates ethical responsibility with historians, heritage professionals, national and international bodies, as well as tourism developers to respect the present and to find processes and opportunities that are inclusive and empowering in community development as well as the representations of place. Further to concern about selectivity, Byrne (2007) eloquently reminds us of the disjunction between that which is readily accessible and that which has been socially and politically silenced; that heritage is a "surface discourse" selectively presenting some aspects of heritage and history.

Tourism should be planned to integrate local culture into its heritage economy and invigorate the sense of place and enable more voices to be heard. But instead, tourism often acts as a valorizing and idealizing agent of the past (Kirshenblatt-Gimblett 2004), selectively sanitizing histories (Hewison 1989) and further

vanquishing inconvenient pasts (Byrne 2007), stereotyping and commodifying peoples, places, and traditions. In these heritage spaces, the flow is not only of different bodies, the "local" and the "visitor," but of different histories, cultures, purposes, and understanding of the values of a place. Edensor (2007) agrees tourism serves to generate a host of competing discourses and practices about a place, identity, and culture.

As everything is relational, messy, and in process, expressing the values of heritage must reflect contemporary practice. With increasing self-authored communication to worldwide audiences on blog sites, Facebook pages, and so on, these competing discourses are powerful and give a significant voice to those who may have an intimate knowledge or may indeed have quite limited connection, knowledge, or respect for a place, its heritage, or its people. Processes and ways to engage with these alternate modes of communication need to be part of any strategy if heritage values are to work in the service of conservation, people, and place. Winter (2004: 330) describes tourism as "the context within which . . . history [can be] articulated and made meaningful." If embraced as an opportunity, tourism can be a vehicle to communicate and share multiple heritages and understanding of one place with many pasts and presents.

Future Directions

Albert and Dyer (2009) conducted a thorough critique of current heritage interpretation praxis. Like Staiff (2014) who presents a blueprint for heritage interpretation, both call for a very different framework, moving away from the dominant thinking in communication models based in cognitive psychology and characterized by the presentation of information. They express deep epistemological concerns about the objectivist, western scientific paradigm on which the "tradition" of interpretation praxis is based. Both raise ontological issues with the asymmetry inherent in such approaches, which are based on many assumptions about "facts," "knowledge," and "experts."

Heritage practitioners should not feel they are the "keepers" of the understanding; they are not the "inheritors"; rather they are the facilitators who should encourage a multiplicity of explorations and a richness of engagements. These should be two-way and utilize processes respectful of the knowledge systems of others. The alternative – to be didactic and *expert* – serves to alienate and threaten that which is deemed to "belong" to all. Heritage professionals know the material history and archaeological bibliography of things, yet may hold quite limited understandings of the emotional and spiritual meanings. Byrne (2007: 20) speaks – evocatively – of his experiences as a heritage professional "travelling through a universe of traces with insufficient local knowledge to be able, for the most part, to quite see them or of being conscious of the murmur of traces without, for the most part, ever quite hearing the words." This opens us to the "world of local knowledge."

Different backgrounds, beliefs, attitudes, understanding, and purposes mean people can relate in meaningful ways to the same place for very different reasons. Seeking to acknowledge, respect, and communicate plurality, diversity, and constancy of change in a living heritage serves the protection of tangible and intangible values of heritage places while sustaining local values and encouraging more responsible and custodial practices.

Heritage, Changing Views of: A Legal Perspective

Hilary A. Soderland
Attorney-at-Law, Seattle, WA, USA

Introduction

The role of law in cultural heritage management is now commonplace. Most, if not all, nations have a legal framework to preserve, protect, and regulate the past. From local to global, law has become interwoven in current cultural debates and practice, as well as in the contemporary fabric of archaeological discourse. International norms and consensus – in some instances amounting to customary international law – have embraced jurisprudence as implicit, if not compelling or obligatory, to appropriate heritage management. Law has the capacity to order, and even to transcend, nation-states' sovereignty as well as conventional geographical, national, and methodological boundaries. Legal burdens of proof, evidentiary standards, and jurisdiction affect the disposition of heritage as well as who has access to the past. Conflicts over repatriation and reburial decided by court ruling are highly visible and typify well-known and easily identifiable points of intersection (*Bonnichsen v. United States*, 367 F.3d 864 (9th Cir. 2004); Burke et al. 2008). However, the compass of law orienting heritage reaches further (Prott and O'Keefe 1984; Carman 1996; Greenfield 1996; Pugh-Smith and Samuels 1996; Richman and Forsyth 2003; Hutt et al. 2005; Gerstenblith 2012). For archaeology, law stipulates excavation and curation protocols and provides enforcement measures to combat threats to preservation and protection, such as looting, illicit trade, and fraud. It defines what constitutes a protected archaeological artifact, establishes who has standing to claim such an object, and frequently is the tool utilized to determine ultimate ownership and disposition. Indeed, legality also structures contemporary policy formation, viability of partnerships, and sociopolitics of the past, present, and future.

Definition

Insofar as jurisprudence has become a customary managerial norm or apparatus for governance, divisions continue to separate the bailiwick of law from the trenches of archaeology (Bruning 2006, 2010). Legal and cultural heritage metrics are often at odds. Cultural heritage encompasses conventional conceptions of the archaeological record as well as intangible constructs of tradition, expression, knowledge, skills, and practice that

recognize nuance and diversity. The ascription of value to heritage can be highly individualized and acutely subjective, particularly when heritage is viewed as a non-fungible, singular commodity. Authenticity and identity vest in modalities of culture. In contrast, law typically adheres to fixed standards and bright line rules. Definitional specificity is essential and legal reasoning is predicated on precedent, procedure, and canons of statutory interpretation. Law has a limited capacity to deviate from such jurisdictional principles, evidentiary standards, burdens of proof, and the right to judicial relief (the requirement that a claimant demonstrate a showing of "standing").

Key Issues/Current Debates/Future Directions/Examples

As such a formal prescriptive mandate, law situates heritage within a rigid regulatory rubric. Archaeological excavation constraints (such as permit requirements), curatorial methods, museological practices, and ownership rights all fall within its regulatory reach. So does prosecutorial discretion for enforcing criminal penalties. Legal standards that operationalize archaeological practice and policy also affect a claimant's ability to assert rights under the law by dictating that expressions of cultural heritage align with or, indeed fit within, a legally articulable right (Bruning 2006). Within heritage contests, the judge's gavel, not the archaeologist's trowel, increasingly directs how the concept of cultural heritage is to be interpreted, and accordingly, whose ownership claim or status is validated. In the legal adversarial process, juridical standards and procedure, as well as legal definitions of heritage, are dispositive. Thus, the true practical nature of opposing cultural heritage claims is exemplified because the contested cultural heritage object(s) (such as ceramics, burial goods, or skeletal remains) effectively can be owned by one claimant only. Ownership determination grants possession, and simultaneously legitimizes and authenticates both the claim to the heritage (or cultural property) and the particular claimant as stakeholder (Crawford 2000). Contentious heritage litigation is not immune to the media fanfare that accompanies courtroom contest and involves a wider, sometimes global, audience.

Nevertheless, as law affects the expression of heritage, so too does heritage inflect the lawmaking process. Heritage and law increasingly acculturate. Both within and beyond national borders, law has become a foremost instrument of change within the domain of cultural heritage and in the field of archaeology. From preservation protocols and looting prohibitions to proprietary interests, change to archaeology has – and will continue – to emerge through legislation and policy. Yet, law, akin to heritage and archaeology, is not exempt from inequalities or power imbalances and so the entrenchment of (post)colonial and hegemonic paradigms exists. Law accords rights to some but not to others. For instance, in the United States, the 1990 *Native American Graves Protection and Repatriation Act* differentially situates indigenous peoples vis-à-vis their cultural heritage since only lineal descendants, "Indian tribes" recognized by the United States federal government, or "Native Hawaiian organizations" have standing under the statute (25 U.S.C. § 3001 *et seq*.). Legal standing also can remain elusive for groups or peoples in "occupied" or war-torn areas or in regions of disputed sovereignty or without formal recognition under international law.

Heritage's definition and demarcation in law for nations to implement protective and regulatory policies, to prioritize rights to certain stakeholders, and to adjudicate conflicting claims is steadily expanding. This phenomenon raises the question of how legal classification directs a contemporary understanding of heritage (Miller 2003; McHugh 2004). It also inquires whether increasingly narrow definitions within law hinder law's capacity to offer a framework that can effectively reach beyond – as well as within – national borders. For even though judicial mores of justice, equity, and impartiality impart useful precepts to competing cultural heritage claims, formal adjudication can fail to account for the multiplicity of values embodied in heritage (Johnson 2007). Traditional forms of legal redress are not always appropriate or realistic when heritage has suffered irrevocable harm – financial compensation

("money damages"), and even restitution/repatriation, may never truly right a "wrong," or make the heritage "whole" again.

Law is certainly not a flawless instrument of heritage management. It does not offer an automatic solution or panacea for conflicting ideologies and complex questions. Tension between cultural heritage/archaeology and law can be great, particularly when court ruling, legal doctrine, or *stare decisis* (precedent) can be viewed as upholding the letter, but not the spirit, of the law. Heritage as a complex dynamic construct with intangible and culturally sensitive attributes is more fluid than law and can be incompatible with law's strictures. Law is often inadequate, lacks sufficient enforcement capabilities, impedes viable local or indigenous partnerships, or is ill-suited or overwhelmed by the practical realities of management, local priorities, indigenous perspectives, and/or grassroots initiatives. However, in spite of its limitations, law is a modern instrument of management often chosen to resolve heritage conflicts. Successful joint management plans or memoranda of understanding can be crafted carefully under judicial auspices to offer innovative, equitable, and legally binding resolution. Differences in law and heritage are not necessarily irreconcilable. With the expanding role and place of law vis-à-vis heritage, law is becoming a fundamental international instrument not only in the domain of cultural heritage but also in the contemporary archaeologist's toolkit.

Heritage: History and Context

Pat Cooke
Department of Art History and Cultural Policy, University College Dublin, Belfield, Dublin, Ireland

Introduction

Definitions of "heritage" are unstable. In particular, the categories of phenomena covered by regulatory definitions of heritage are subject to periodic alteration in scope and content. This is due largely to the fact that in contemporary multicultural and diverse societies, there is constant competition among cultural groups and communities of interest to have their heritage formally or officially recognized. More recent definitions recognize that definitions are rooted in subjective understandings of material culture, not objectively inherent in the material traces of prehistory and history.

Definition

In thinking about heritage, we need to distinguish between a primordial intergenerational practice and a particular, institutionalized mode of structuring identity and experience that the word has more recently come to embody.

It is part of our common humanity to inherit things, practices and ideas bequeathed us by our predecessors. This sense is largely captured in the term "inheritance." But in modern times "heritage" has become detached from the realms of personal, familial, and tribal transaction and emerged as an *episteme*, a way of structuring our understanding of the world (Hooper-Greenhill 1992: 12). By the 1980s, we had become so suffused in heritage-consciousness that it precipitated a strong, critical reaction. Lowenthal's spirited polemic *The Heritage Crusade and the Spoils of History* (1998) described a world cosmically supersaturated with heritage. "All at once," he cried out in exasperation, "heritage is everywhere – in the news, in the movies, in the marketplace – in everything from galaxies to genes" (1998: xiii).

Though it is possible to trace the modern roots of heritage from practices of collecting and keeping in Renaissance Italy, and onwards through the incipient stages of a travel and leisure industry in the nineteenth century, the elevation of heritage into an episteme that structures our understanding of the world, and saturates it in the way described by Lowenthal, postdates the Second World War. The long-run period of prosperity that stretched from the late 1940s through to the crisis of 2008 facilitated a massive expansion in the scale and scope of leisure activities, combined with the economic means to pursue interests in culture. More than 90% of the world's museums postdate the

Second World War, as does most national heritage legislation and almost all international charters and conventions designed to protect it.

Tourism became the primary medium through which cultural phenomena and experiences were converted into economic resources and objects of consumption. Travel, the key modality of tourism, shaped the modern idea of heritage through the sense of space and place (one traveled to see places – Machu Picchu – or to see things gathered together in certain locations, the British Museum and the Louvre). Heritage was both material and experiential in nature, what you went on your holidays to see and what you photographed to prove you had been there. However, the construction of heritage through tourism and cultural consumption provoked the emergence of a heritage critique in the 1980s. At the heart of this critique lay a challenge to the assumption that the prehistorical, historical, natural, and aesthetic dimensions of the world can be categorized and packaged as heritage according to expertly determined or putatively objective criteria.

Tunbridge and Ashworth offered the first systematic analysis of heritage as a deeply subjective phenomenon in *Dissonant Heritage: The Management of the Past as a Resource in Conflict* (1996). They noted how the meaning of the term had been dramatically expanded to include all physical traces of the past in the present, the natural world, and those "experiences" generated by the tourist industry (1996: 1–2). The effect of this category expansion was to render heritage increasingly unmanageable. If heritage was without apparent boundaries, how were scarce resources to be deployed in its care? They rejected the notion of heritage as a "fixed resource endowment." The idea that there was "a fixed quantity of a conservable past that is recognizable through objective, universal, and measurable sets of intrinsic criteria" was, they argued, an illusion given credibility by legislation designed to define, conserve, and protect it. Heritage arose in response to consumer demands and management skills in exploiting them (1996: 9). Heritage, in essence, was rooted in subjectivity; it was a matter of choice, most often of consumer choice.

French economist Francois Benhamou noted how the definition of heritage for legislative purposes was subject to refinement and expansion but rarely to contraction. "The concept of heritage is becoming more and more extended," she wrote and warned that "heritage policies promote their own destruction by widening the definition of heritage" (Benhamou 1998: 75). A growing body of national and international legislation authorized an iterative and expansionary approach to the definition of heritage. The *UN Convention on the Protection of the World Cultural and Natural Heritage* (1972), for example, divides heritage into "built" and "natural" components but then leaves it to each state to decide how these broad categories are to be extended to particular properties in its jurisdiction – a level of discretion that allows for boundless variation in how the convention is applied. The resource challenges posed by heritage led some to argue, the author among them, that the effective management of heritage required its containment through more restrictive approaches to its definition (Cooke 2003).

A more historically based approach to defining heritage was to focus on the process of its production. Stanziola (1998: 168–176) traced the growth of heritage in the American context. Up to the 1940s, the rationale for recognizing phenomena as heritage remained primarily patriotic (Washington's home at Mount Vernon was the first protected historic house) and aesthetic (landscapes protected under the National Parks Act of 1916 were chosen primarily for their sublime and picturesque qualities, while wealthy philanthropists funded the great art museums). Then, beginning in the 1950s, the process of definition expanded to include the heritage content of the historic environment and its role in maintaining the fabric of community at local and regional levels. Hitherto, heritage's reach had embraced a selection of iconic national sites and artifacts and things and places chosen with discriminating connoisseurship for their aesthetic appeal; now, it extended over a wide expanse of popular culture and subcultures.

Goodey traces this growth more precisely in the British context. In the 1960s, he identifies two

main vectors of growth: firstly, the "democratization of culture," a process by which the heritage of all was deemed to be as significant as that of the (mostly aristocratic) few and secondly what he calls "geographical equality," which is closely related to the democratization process but arises more precisely from the attempt to revitalize areas impoverished by the decline of heavy industries. Government, local, and national turned to the "designers of a new geography" that relied heavily on nostalgia and historic associations to bring new life to dilapidated towns and industrial areas (1998: 201).

Tunbridge and Ashworth's "dissonant heritage" model works both as an epistemological tool and as a vector of production. At its core is the question of representation. Where nation states used to project a synthetic "imagined community" by claiming authority over a coherent national culture and heritage, now the diluting influence of globalization compels them to recognize and validate complex layers of local, communitarian, and multicultural forms of identity. Heritage dissonance arises substantially from these competing perspectives. The more we disagree about heritage as an expression of disputed identities, the more of it we tend to produce to satisfy the various identity claims.

The growth of cultural economics as a discipline added further tools and refinements to the critique. A central concern of economics from a public policy perspective is the allocation of scarce resources among competing interests. Though most economists accept the legitimacy of public funding of heritage, Peacock (1998: 22) states as a basic principle of its economic analysis that "the preservation of the past is not some segregated element in the list of benefits to humankind, but consists of inputs of resources which must be shown to contribute to our welfare in a more effective way than in any alternative use." Keeping up the stock of heritage amenities requiring care and conservation creates opportunity costs, as the resources involved could be used for alternative purposes (Frey 1997: 31). By developing concepts such as option value (the postponed gratification of enjoying a cultural amenity in the future), bequest value (a thing whose intrinsic value lies in its anticipated value to future generations) and existence value (the sheer pleasure of knowing something exists, regardless of the personal opportunity to experience it), and methodologies such as contingent valuation (a survey used to elicit people's willingness-to-pay for objects or projects), economists have contributed to the containability and manageability of heritage at both the conceptual and managerial levels (Throsby 2010).

Heritage: Public Perceptions

Cornelius Holtorf
School of Cultural Sciences, Linnaeus University, Kalmar, Sweden

Introduction

In the public domain, heritage is perceived and widely appreciated in relation to stories which people tell about themselves. This applies in particular to the perception of cultural heritage in public life within so-called Western societies. Intriguingly, heritage is here often not valued for its literal content, that is, what it reveals about a past reality, but for its metaphorical content, that is, the stories it evokes about present reality. Such stories may establish social distinction through the onlooker's display of knowledge that is considered desirable; they may manifest belonging through symbolic references of heritage to a common past suggesting a shared collective identity; or they may describe alternative ways of life which can stimulate audiences in the process of reconsidering their own lives. All such stories are sometimes used politically or for commercial purposes, for example, in the context of cultural tourism, advertising, and commodified experiences. The way heritage is publically perceived has profound implications for how to manage cultural resources.

The motivation to travel and visit heritage sites is in many cases not a genuine experience of foreign places and their past but the realization of dreams and desires firmly linked to and preconceived at the point of origin (Hennig 1999). David Horne cited the telling example of the Stoa of Attalus which the American School of Classical Studies at Athens, Greece, reconstructed during the 1950s in its original place on the Athenian Agora. Significantly, "they were faithful to every known detail except one – they couldn't bring themselves to paint it in red and blue as it had been in the original. To have been authentic would have made it seem untrue to the modern stereotype of the classical" (Horne 1984: 29). In other words, the authenticity of a place is judged by the tourists' own preconceptions of the place and needs to be carefully managed by the heritage and tourism industries. The main asset of cultural heritage is thus its capacity to tell or evoke stories that appeal in the present.

Key Issues

Heritage and Social Distinction

As tourists, people travel the world to visit heritage attractions, but they also visit local heritage sites. Visitors often wish to learn about a culture by learning about its heritage and history. This preference is often perceived as a question of personal choice and taste. Taste and preference are however acquired and governed by social parameters like class and lifestyle. This is the main point of the French sociologist Pierre Bourdieu's (1984) famous "social critique of the judgment of taste": tell me what you like and I tell you who you are!

The German sociologist Gerhard Schulze (1993) argued similarly that the Experience Society in which we are living is segmented and that customers demand experiences that correspond to one of several predefined schemes related to their social position and lifestyle. Some people, who see themselves as particularly cultivated, enjoy culture that is consumed with the brain and does not stimulate extensive bodily reactions. Others will prefer cultural experiences that are unpretentious, embodied, and best consumed collectively.

A final group prefers experiencing environments that involve the entire body and all the senses and quickly change focus in order to avoid boredom. All these different groups may enjoy heritage, yet in distinctive ways that conform to the particular scheme with which they associate themselves. Whereas some can never have enough written information, others may primarily demand short and entertaining guided tours, and others again mostly want to engage themselves in exciting activities. Often heritage destinations now offer something for each of these (and other) preferences. Significantly, in each case one of the main aims of consuming heritage is in fact a confirmation of the visitor's own social milieu and lifestyle.

The story people are perhaps most interested in when they choose to visit heritage sites is thus in part a story about themselves rather than one about the sites or objects they look at. It takes some education and class to actually choose to look at ancient ruins at all, rather than lie on the beach or watch a blockbuster movie (Schulze 1993: 145). Heritage is valued because it allows people to tell stories about – and thereby reaffirm – their own social affinities and lifestyles. These stories are best told at sites whose significance is widely recognized in people's own social context, which is why tourists always "must see" the same sites first. At the same time, heritage can be meaningless for visitors when it appears to be unrelated or contrasting to the scheme governing their own lifestyle. The story of heritage matters insofar as it is about the visitors themselves and not about the past. Visitors like to buy, and often treasure, tokens of their visits such as postcards, entrance tickets, and especially souvenir guidebooks. Although many such guides will remain unread, they remind people for many years of their trip and that (rather than what) they have learned. In *The Great Museum: The Re-Presentation of History*, Australian writer Donald Horne (1984: 10) argued accordingly that "what matters is what [tourists] are told they are seeing. The fame of the object becomes its meaning; what finally matters may be a souvenir postcard, perhaps even the admission ticket, kept for years afterwards. . .."

Heritage and Shared Collective Identities

Another public perception of heritage is related to stories it evokes about the visitors' shared collective identities as members of distinctive ethnic or cultural communities. At the most general level, World Heritage sites and any exhibits about human origins emphasize our human identity as members of the same species and the fact that all people on this planet belong into this same category. For example, the Hall of Human Origins at the Smithsonian Museum of Natural History opened in 2010 with the aim "to provide visitors and online guests with an exciting educational experience that will encourage them to explore for themselves the scientific discoveries about what it means to be human" (www.humanorigins.si.edu/exhibit). On a continental level, the European Commission and the Council of Europe have long been pursuing cultural policies that promote European integration, for example, with the European heritage label introduced in 2013.

At the same time, heritage sites and many museums have long been managed as part of the collective heritage of a given nation-state. They thus reify preconceived national identities (Kristiansen 1993). On a somewhat smaller scale, something equivalent might be said about regional and local heritage and the regional and local identities supported by them. In each case, the cultural heritage contributes to people's self-understanding as members of a given community, whether as neighbors locally, as inhabitants of a region, or as citizens of a nation-state. The heritage seemingly manifesting such collective identities is often proudly presented to visitors of these nations, regions, or local communities. By appreciating the shared heritage of other communities, the visitors may also become more aware of their own ethnic or cultural collective identities.

In some cases, heritage can also stimulate or strengthen cultural identities of people that are linked to their social positions, as discussed earlier. Examples are particular segments of the population pursuing an interest in the heritage of the working classes, the heritage of African Americans, or the heritage of specific families. Here too,

a shared heritage serves to link people with each other and contributes to their shared identities in the present. But at the same time, these identities reflect social realities and lifestyles as well.

Heritage is thus valued because it allows people to tell stories of the past which can reassure them as members of particular communities in the present. It is almost irrelevant precisely what kind of past is shared or how limited our knowledge about that past may be. The limited knowledge of our most distant ancestors during the Pliocene is as sufficient for collective human identity as the well-documented heritage of twentieth-century cities for collective urban identities. German collective identity is to the same extent manifested in the heritage of Nazi atrocities (or Beethoven) as is Russian collective identity in the heritage of Pushkin (or Stalinism). A community of people may be as strongly defined by genealogical links going back two or three generations as by racial oppression or discrimination that has been going on for centuries. What matters is not so much the richness or character or length of the story being told but that a story is being told at all! Heritage thus does not necessarily function as a source of information about the past but may also become a therapy for people uncertain about who they are.

Heritage and Alternative Ways of Life

Heritage is also valued in society because it tells stories about alternative ways of life which stimulate audiences in the process of reconsidering their own present-day realities. Time-travel experiences are becoming ever more popular, whether in the form of role-play or living history, docusoaps, historical novels, or computer-generated simulations in games and films (Petersson and Holtorf 2017). Time travel does not demand a particular intellectual attitude, but it is about imagining other worlds from the embodied perspective of somebody actually living in that world, often involving multiple senses. The lessons drawn from such experiences may be nostalgic in character, admiring conditions of the past; they may be reconfirming the status quo of human life in present society; or they may be progressive, hoping for continuing improvements in the future.

The popularity of time travel is indicative for the transformed society we have been living in for more than two decades. Gerhard Schulze (1993) argued that experience value is quickly replacing use and monetary values in significance. As people in affluent Western societies have become economically secure and possess all the tools they require, they are orientating their lives more and more toward other values. Sometimes you hear today that a full life worth living is one in which the person concerned has seen and experienced a lot of different things. The market for experiences has thus been expanding fast. The American economists Joseph Pine and James Gilmore argued in their book *The Experience Economy* (2011) that those businesses that relegate themselves to the diminishing world of goods and services will be rendered irrelevant. Instead, businesses now need to offer experiences to people. These experiences consist of more than simply fun and are first and foremost about engaging people sensually, cognitively, socially, culturally, and emotionally. Yet there is still also a risk that fictive commercial pasts serve nothing but monetary gain or particular political ideologies (Kristiansen 1993).

Another widely appreciated alternative way of life linked to heritage is expressed in stories about the experts working with heritage. The aura of the genuine and authentic site or artifact puts even professional archaeologists and conservators (among others) in a special light. David Horne (1984: 17) reasoned that precisely "the importance of the authentic can be so great that techniques of restoration may be more interesting to tourists than what has been restored." This was borne out, for example, in the extremely popular Vasa Museum in Stockholm, Sweden, where for many years the main display in a foggy hall was the partly covered remains of a seventeenth-century warship regularly sprayed with water during the process of conservation.

Heritage may also evoke stories about exciting exploration and discovery, about meticulous documentation and analysis, and about outreach and preservation. This is mostly the domain of the archaeologist investigating heritage, not the least through the method of excavation. In popular

culture, the archaeologist is often portrayed as a hero and role model, competent and resourceful, responsibly serving the interests of society and of humanity (Holtorf 2007). Many visitors are excited about the process of archaeological research and would like to get involved in archaeological excavations themselves. Many wish they could realize this childhood dream in their own lives. The Canadian archaeologist Karolyn Smardz (1997: 103) once speculated that it is precisely "the excitement and romance of archaeological discovery that makes people think archaeology is worth doing and learning about." Quite rightly, she concluded that "it is not archaeology's ability to help all of us gain a better understanding of how people lived in the past that makes archaeology marketable, it is also that mysterious, romantic, exotic sense of delving into the unknown – ergo, the very process of archaeological research." The process of doing archaeology seems in many cases more exciting than its results, and it may bring about benefits for the visitors' quality of life that reach far beyond those gained from insights about the past.

Conclusions: Public Perceptions of Heritage and Cultural Resource Management

This analysis of the public perceptions and appreciation of heritage may imply that it is almost beside the point to convey to visitors any specific information about what actually happened in the past. Whether or not this conclusion holds true in its totality, heritage managers are certainly well advised to acknowledge existing preconceptions of heritage and the stories it evokes about the present. An interesting medieval cathedral may be interesting because it reaffirms a social milieu in which "you know your art history," and a precious Stone Age burial may be precious because it marks the beginning of the story of your own local community. Heritage is often less valued for its literal than for its metaphorical content, that is, stories about remains of the past that are much more stories about the present. As a consequence, it matters little for the storytelling potential if a heritage site has been meticulously repaired, faithfully restored, or entirely reconstructed – as long as it provides visitors with a believable experience. This does not make heritage any less important. If anything, experiencing heritage in terms of the stories it tells about the present increases its currency in the Experience Society. As many have argued, stories and experiences have become essential to people's social identities and often give inspiration, meaning, and happiness to their lives. It is the stories we tell that distinguish us from each other and make life enjoyable, maybe even worth living (Schulze 1993; Pine and Gilmore 2011). This is the larger social context within which the contemporary significance of cultural heritage must be seen.

One immediate implication is that heritage managers should from the very start of their involvement be actively engaging with all the people involved (the multiple stakeholders) and take seriously the stories about the present that are told through the cultural heritage. By the same token, in a major review of the Swedish heritage sector entitled "Putting People First," it was concluded that "we must make the public's involvement and participation our top priorities" and that "the motivation for preserving an object or an environment comes from the need and desire to tell a story" (Operation Heritage 2004: 12–13). Not all such stories will, however, be equally acceptable in political and indeed ethical terms. Whereas some public perceptions may deserve to be supported for the benefits they bring to quality of life and social cohesion, others may need to be problematized and even undermined when they harm political or ethical core values of society. In order to do so competently, a great deal of new research will be needed in order to better understand precisely how the cultural heritage is experienced and what stories are being told or appreciated by whom, in which contexts, and with which consequences. As the Danish archaeologist Kristian Kristiansen pointed out already in 1993, it is high time that archaeologists lose their political innocence and critically assess the way in which heritage and the past are popular, useful, and marketable in present society. Although research into that direction has begun by now,

there still remains much to be done, especially as society is continuously evolving.

Archaeologists and historians will always run the risk of construing in their work a representation of the past that is mostly an extension of the present. But this is maybe less a risk as an opportunity, as heritage matters when the stories about heritage matter. Ironically, therefore, an extension of their present may be precisely what visitors value most in their perceptions of heritage.

High Lodge Archaeology Site

Nick Ashton
Department of Prehistory and Europe, British Museum, London, UK

Introduction

The site of High Lodge is situated in a disused clay pit in the Brecklands of Suffolk, UK. Artifacts were first discovered in the 1860s and were described together with the stratigraphy of the site by Sir John Evans (1872). He noted that at the base of the site lay glacial chalky boulder clay, which was overlain by red clay containing finely retouched scrapers. These in turn were overlain by sands and gravels containing handaxes, and boulder clay was also noted higher up the slope. Skertchley was the first to argue that this was a separate, stratigraphically higher boulder clay (Whittaker et al. 1891), which was controversial in the late nineteenth century as the pre-glacial antiquity of people had yet to be accepted.

A second controversy arose because the finely retouched scrapers were likened to those from Le Moustier in France (later termed Mousterian), while the overlying handaxes were typical of the earlier "drift" period or Lower Paleolithic. This inversion of the typological sequences observed

elsewhere led to a series of papers describing a variety of stratigraphic schemes, none of which could be observed within single sections (Evans 1897; Sturge 1911; Marr 1921; Harrison 1938).

Key Issues/Current Debates/Future Directions/Examples

The first large-scale excavations took place from 1962 to 1968 by Gale Sieveking of the British Museum. In addition to recovering properly excavated lithic assemblages and environmental data, a primary aim was to unravel the geological sequence and dating of the site. A conflict between an early geological age for the site and the apparently late date for the "Mousterian-like" flint artifacts delayed publication. These problems were resolved through further fieldwork in 1988, and the excavations were finally published in 1992 (Ashton et al. 1992). This latter work established the current understanding of the geological and environmental succession.

The oldest sediments at the site consist of clayey silts laid down as floodplain sediments and attributed to an eastward flowing river, called the Bytham (Lewis 1992). The Bytham river flowed from the Midlands across East Anglia, depositing quartz- and quartzite-rich gravels from its source areas and incorporated into the floodplain sediments at High Lodge. The course of the Bytham river was destroyed by the Anglian glaciation (MIS 12: c. 470–420 ka), which was the most extensive glaciation across Britain, reaching as far south as London. At High Lodge the floodplain sediments were glacially transported as frozen blocks by the ice, resulting in their emplacement above Anglian Lowestoft Till (the "chalky boulder clay"). The transported clayey silts were then overlain by outwash gravels and a soliflucted till from the same ice sheet. The clayey silts therefore date to a temperate phase prior to the Anglian glaciation, probably MIS 13 (c. 500 ka) or possibly older. An MIS 13 age is also supported by the recovery within the clayey silts of part of a rhinoceros tooth attributed to the *Stephanorhinus hundsheimensis* group, which became extinct after MIS 12 (Stuart 1992).

The clayey silts preserve pollen, insects, and occasionally wood and vertebrate remains. The palynology appears to show little change through the sequence with vegetation dominated by pine and spruce together with juniper and heathland plants (Hunt 1992). Pools and marshland are indicated with seasonal flooding from the nearby river. The insect fauna reflects a similar array of wetland habitats and also provide Mutual Climatic Range temperature estimates of summers between 15 °C and 16 °C and winters between −4 °C and 1 °C (Coope 2006). The vertebrate fauna is sparse but in addition to *Stephanorhinus hundsheimensis* can be added straight-tusked elephant (*Palaeoloxodon antiquus*), horse (*Equus sp.*), a medium-sized cervid, and a large bovid (Stuart 1992). In combination, the environmental remains reflect the marshy floodplain of a large river, surrounded by pine and spruce forest in a climate several degrees cooler than East Anglia today (Ashton and Lewis 2012).

The archaeological assemblages have been divided into five stratigraphic units, three of which come from different horizons within the clayey silts (Beds B, C1, and C2). A fourth assemblage (Bed D) was recovered from small runnels cut into the top of the clayey silts and probably derived from that bed. The final assemblage (Bed E) was recovered from the base of the overlying outwash sands and gravels (Ashton 1992). All the assemblages are in fresh condition, with slightly more abrasion occurring on the artifacts from Bed E.

The assemblages from Beds B, C1, and C2 can be treated as a single unit. The artifacts are spread over a depth of 2 m, but it is difficult to recognize distinct horizons, although they occur in greater densities towards the top. Over 1200 artifacts were excavated including 984 flakes, 69 flake tools, and 52 cores. The exact source of raw material is unknown, although as chalk-containing flint underlies the site, large nodules of flint would have been available in the nearby river sediments. The core working is typical of that found in other British Lower Paleolithic assemblages, where nodules of flint were worked through single-platform and alternate-platform techniques, sometimes with the core being rotated to find the next

High Lodge Archaeology Site, Fig. 1 Flint core with refitting flakes from High Lodge Bed C2 showing alternate-platform technique. (Illustration by Phil Dean. Reproduced by permission of the Trustees of the British Museum)

best platform from which to detach further flakes (Fig. 1). In this way the evolving configuration of the core determined the next flake removals. This type of technology has often been described as Clactonian but in fact also occurs in Acheulian handaxe assemblages (McNabb 2007).

Flint knapping occurred on the site, as shown by the refitting flakes, flake tools, and cores, which were excavated as distinct knapping scatters in two locations. Elsewhere the scatter of artifacts seems more disturbed, perhaps caused by the transportation by ice.

The flake tools consist of notches, denticulates, and a range of scrapers. The notches and denticulates tend to be made on smaller flakes with single or multiple detachments from lateral, distal, or proximal edges and sometimes on the ventral side. By contrast the scrapers tend to be made on slightly larger flakes with semi-invasive retouch on a variety of lateral or distal edges. In two particular cases, large single scrapers have been created with finely executed, invasive retouch (Fig. 2) and are more typical of those recovered by collectors during the nineteenth and early twentieth centuries. The old collections are clearly biased towards the larger more elaborate tools, but they do provide an insight into the full range of scraper forms. These include convergent scrapers, sometimes with retouching or thinning of the butt and occasionally retouch on the ventral face.

The assemblage from Bed D was recovered from fine silts that infilled shallow channels and runnels across the surface of the floodplain clayey silts. The runnels were often less than 1 m wide and 50 cm deep and contained a small lag gravel containing artifacts at the base. The lag gravel was almost certainly derived from the underlying floodplain deposits. This interpretation is supported by the similarities in technology and typology of Bed D with Beds B, C1, and C2. The Bed D assemblage consists of 301 artifacts including 254 flakes, 16 flake tools, and 15 cores. The core technology is indistinguishable from that of Beds B, C1, and C2, and there is a similar range of notches and scrapers.

The assemblage from Bed E occurs in the lowermost part of the overlying glacial outwash gravels and consists of 462 artifacts, including 384 flakes, 15 flake tools, 14 handaxes, and 13 cores. The technology of the core working is again similar to that from Beds B to D with the use of single-platform and alternate-platform

High Lodge Archaeology Site, Fig. 2 Flint scrapers High Lodge Bed C2 (*1*, *2*, and *4*) and Bed D (*3*). (Illustrations by Phil Dean. Reproduced by permission of the Trustees of the British Museum)

techniques deployed around the evolving cores. The flake tools are also similar with a range of notches, denticulates, and scrapers. At least one of the scrapers is invasively retouched and resembles the more elaborate scrapers from Bed C2. The only distinction of the assemblage from Bed E is the presence of 14 handaxes (Fig. 3). These consist of cordiform, ovate, and limande forms varying from 20 to 7 cm in length. They are finely made with soft-hammer percussion and occasionally have tranchet-sharpening removals. This range of forms is consistent with those recovered by collectors during the nineteenth and twentieth centuries.

The slight abrasion of the artifacts in Bed E suggests minimal transport within the glacial outwash gravel. Equally it seems unlikely that the assemblage is contemporary with the glacial conditions represented by the outwash gravel, when Britain would have been difficult to inhabit. The most likely explanation is that the assemblage was derived from a different location on the floodplain and transported a minimal distance prior to deposition. Whether the distinction in the assemblages reflects different activity areas on the floodplain or separate human groups with different tool types perhaps occupying the area at slightly different times is not clear.

The finely made scrapers from High Lodge are still unusual in the context of the Lower Paleolithic of Britain, where scrapers are rare and retouch is often sporadic with little attention paid to form. One exception is the site of Warren Hill, which lies only 800 m to the south of High Lodge (Bridgland et al. 1995). Here Bytham river gravels from the lowest terrace, also dating to MIS 13, contain a wealth of handaxes, many being similar to those from Bed E at High Lodge. In addition to the handaxes is a small series of elaborate scrapers, which have a remarkable similarity to the scrapers from Bed C2 at High Lodge. Indeed the assemblage from Warren Hill has been fluvially transported and could derive from the same floodplain sediments.

One aspect of the scrapers that should not be overlooked is their possible function. Although there is no direct evidence, there is little doubt that they would have functioned well in the processing of hides. If this is the case, High Lodge provides one of the earliest records at least in

High Lodge Archaeology Site, Fig. 3 Flint handaxes from High Lodge Bed E. (Illustrations by Phil Dean. Reproduced by permission of the Trustees of the British Museum)

northern Europe for the abundant production of hide-working tools and by inference the use of hides for perhaps clothing or shelter (Ashton and Lewis 2012). It also implies that they were the top carnivore and had first access to the carcasses prior to the destructive scavenging by other predators such as hyena. At High Lodge it is pertinent that the possible early evidence for thermal buffering in the form of hide use coincides with a climate that is several degrees cooler than Britain today.

In summary, the site of High Lodge dates to c. 500 ka or possibly earlier. Humans occupied the open, marshy floodplain of the Bytham river surrounded by forest of pine and spruce in a climate several degrees cooler than Britain today. At least one of the activities taking place at the site was the manufacture of carefully crafted scrapers, perhaps used for the processing of hides for use as clothing or for shelter. Elsewhere on the floodplain, another or perhaps the same human group made handaxes, perhaps closer to the flint raw material sources exposed by the river. With the ensuing Anglian glaciation about 450 ka, the floodplain deposits were rafted as frozen blocks and emplaced above and within the glacial sediments, awaiting discovery in the middle of the nineteenth century.

High-Altitude Archaeology in Southeastern Europe

Paolo Biagi[1], Renato Nisbet[1] and Elisabetta Starnini[2]

[1]Department of Asian and North African Studies, Ca' Foscari University of Venice, Venezia, Italy

[2]Department of Civilizations and Forms of Knowledge, University of Pisa, Pisa, Italy

Introduction

The scope of this entry is to describe and discuss some aspects of high-altitude archaeology. The paper focuses mainly on the data available from

High-Altitude Archaeology in Southeastern Europe, Fig. 1 Distribution of the sites and localities mentioned in the text. (1) Zurich Lake (CH), (2) Schnidejoch (CH), (3) Similaun (I), (4) Adige Valley, Romagnano (I), (5) Valcamonica, Crestoso (I), (6) Balm' Chanto (I), (7) Hallstatt (A), (8) Lessini Hills (I), (9) Monviso (I), (10) Finalese caves (I), (11) Iron Gates (SRB), (12) Cheile Turzi (RO), (13) Prut River (UA), (14) Ohrid (MK), (15) Dispiliò (GR), (16) Samarina (GR), (17) Epirus (GR), (18) Dmanisi (GE), (19) Trialeti (GE), (20) Chikiani (GE), (21) Aruchlo (GE), (22) Göytepe (AZ), (23) Muhkoi (RUS). (Drawing by E. Starnini)

four important mountain regions of Southeastern Europe, which show quite different geomorphological characteristics, climate, altitude, and latitude: the Alps, the Carpathians, the Pindus, and the Caucasus (Fig. 1). During the last 50 years, archaeological research in the highland zones has greatly improved. Moreover, it started to attract attention of many archaeologists throughout the world. These changes were due to the developing consciousness that mountains do not necessarily constitute impassable natural barriers for humans. This is demonstrated also by the fact that they are inhabited, at least since Medieval times, by peoples with very similar attitudes, behavior, and cultural background though often speaking different languages and dialects.

Slowly, the improving number and quality of archaeological data began to show how important mountains are in the study of human history and adaptation. Natural resources, such as precious ores, among which are gold and silver and everyday use stones and salt also employed as exchange goods, in many cases played a key role in the economy of very important prehistoric and protohistoric systems, while geographic locations and alpine pastures of easy access were approached moving from the surrounding plains following well-defined footpaths, gentle slopes, and watersheds. The same mountains started to be part of the subsistence strategy of prehistoric communities at least since the Late Neolithic.

During the last decades, we have seen an intensification of highland zone archaeological research in many countries of Europe, Asia, as well as the Americas (Stirn 2014). Many projects have been promoted, aimed to the interpretation of the reasons why, and the periods when, humans began to explore and settle at high altitudes, as well as to study the different types of traces they left during their movements across mountain environments. It has become clear that some Southeastern European mountain chains began to be approached already at the very beginning of the Palaeolithic, at least 2 Myr ago (Vasilyev and Amirkhanov 2018). These discoveries show that humans explored and exploited high-altitude resources during almost every period of prehistory, despite challenging environmental conditions.

State of Knowledge

Geography and Environment

Most of Europe south of the 49th parallel is mountainous, with its largest ranges running from west to east (Pyrenees, Alps) or forming a wide arc toward south (Carpathians) (Fig. 1). The forces responsible of the uplift of these enormous masses altogether covering ca 340,000 km^2 were active in different geological periods (the Pyrenees being older than the Alps and the Carpathians), though similar in their origin (collision between tectonic plates) (Siegesmund et al. 2008). The huge southern compression forces resulted in different size and shape: the Pyrenees stretch over a length of 430 km, with a maximum width of 120 km; the Alps over 1200 and 200 km; and the Carpathians over 1450 and, at their maximum, 400 km. Farther east, Caucasia is another very large ethnical and linguistic highland zone covering 440,000 km^2, with a length of 840 km and a width of 240 km, with peaks higher than 5600 m that find no comparison with those from other regions of Europe.

The main longitudinal striking of the chains has several important consequences. For instance, in the Alps:

(1) The separation between waters and runoff, with a higher stability of the regimes with glacial melting mostly on the north and relative instability of the regimes in the rain-fed rivers on the south. The contribution of the mountains to the periodic flow of the main rivers is always crucial, particularly in summer when river flow is low in the lowlands, though high in the Alpine Rivers due to snow and ice melt.
(2) A difference in the altitude of the permanent snow line of even 700 m between the northern and the southern side, with strong climatic implications.
(3) Local sharp changes in the topography and microclimate.
(4) Geological and soil chemistry peculiarities (crystalline rocks and acid soils prevailing in the western part of the chain, sedimentary calcareous rocks, and basic soils in the eastern section).
(5) Resulting local/regional ecological properties affecting prehistoric settlement distribution and economy.

Throughout the Pleistocene, glacial and interglacial conditions repeatedly affected entire Europe, drastically changing landscapes, faunas, and floras. During the last 800 ka, glacial cycles have succeeded with a periodicity of ca 100 ka. They are currently explained as consequent to changes in solar radiation coupled with critical levels of atmospheric CO_2. Evidences of glaciations can be observed in the geomorphologic characteristic roundness of the mountain slopes, ice cores, marine sediments, and sea-level variations. The structure of climatic change in the last 100 ka has been analyzed using different proxies, recently taking into account ice volume variations throughout several glacial cycles. During the last glacial maximum (LGM) roughly between 26 and 20 ka, most of the mountain range was capped with ice. Numeral models suggest a maximum ice volume of 163×10 km^3 just after 24 ka. However, we know that temperatures during the cold stages were not uniform. For instance, within the very cold Marine Isotope Stage MIS-4 and 2, spanning between 71 and 10 ka, a warmer interval occurred between 57 and 24 ka (MIS-3), with short cycles of 100–1000 year between warmer and nearly glacial conditions. During this period anatomically modern humans (AMH) replaced Neanderthals all over Europe. However, it would be misleading to consider the Alpine environment to be unable to offer favorable niches for hunting and collecting even during the harsh climatic conditions of the LGM. Middle- and high-altitude Middle Palaeolithic Mousterian sites have been discovered in the Alps, Pindus, Rhodopes, the Caucasus, and the Crimean Mountains. If one would suggest that during the coldest phases of the Late Glacial the Alps acted as an obstacle to hunters moving from the southern provinces of Europe, nevertheless we know very well that their unique ecosystems were locally exploited as soon as the slopes became free from ice toward the end of the LGM.

Human Settling

In the case of the Alps, a first exploration of the highland zones by the last hunter-gatherers began around 12,000 BP, during the Allerød interstadial. It was followed in the following periods, characterized by Early Holocene climatic ameliorations and later by the advent of Neolithic farming during the mid-Atlantic (Weninger et al. 2006). At present, the chronology of these events is well known both in the Alps and the Apennines, thanks to many pollen cores extracted from peat basins located close to high-altitude archaeological sites (Lowe 1992; Oeggl 1994).

The barren surfaces exposed by glacial withdraw were rapidly occupied by a pioneer vegetation, composed mainly by Poaceae (grasses) and *Artemisia*, with the presence of willows and pines. Pollen and macrofossil diagrams show similar evolutionary patterns both in the mountains and the plains. Broadly speaking, tundra-like vegetation is followed by a conifers tree cover. Starting from the plains, the slopes are gradually invaded by broad-leaved trees, and the typical Alpine vegetation zonation is settled during the mid-Holocene when the last hunter-gatherers are replaced by the first farmers. This is an important turning point in the ecology of the mountains, when the human impact on the landscape becomes an important element of transformation. Pastoralism, short (prehistoric)- and long (historic)-range transhumance, mining, and large use of fire to open wide pastures in the previous woodland are elements (Primas 1999) whose effects, protracted for centuries, result in soil erosion, slope instability, and stronger surface runoff. Growing intensity of mountain exploitation from the Late Neolithic onward is a general pattern observable in high-altitude sites all over Europe, as widely shown by the research currently underway in the Pyrenees (Catalan et al. 2017a) and the Carpathians (Pelisiak et al. 2018).

In the Swiss Alps, the present glacier retreat caused by global warming has brought to light the presence of organic archaeological artifacts among which are wooden bowls, a bow, shoes, a leather legging, and bark fibers in the melting ice at Schnidejoch and other high-altitude passes. They demonstrate that this region of the Alpine chain was frequently crossed between the Neolithic and the Iron Age (Hafner et al. 2017). A similar case is known also from the eastern Alps of South Tyrol, where the Similaun Man (otherwise known as Ötzi) was discovered in the autumn of 1991 at 3210 m of altitude within a natural depression later filled with ice. His very rich organic equipment, composed of everyday use artifacts, clothes, and shoes, was radiocarbon dated between ca 4700 and 4500 BP. This find shows us the way Chalcolithic people were equipped to survive extreme environmental conditions during their movements that involved the crossing of high-altitude passes (Kutschera et al. 2000). Curiously enough, the mtDNA analysis has shown that the Similaun Man belongs to a group that does not show any descendants in the extant population of the Alps (Coia et al. 2016).

Not all the mountains of Southern Europe share the aforementioned pattern. The Italian Apennines and the Pindus in Greece run north/south, and their climate is influenced by the sea. However, also the role played by lower altitude glaciers has been important during some periods of the Quaternary. Around the Smolikas, the highest peak of the Pindus range of Western Macedonia in Greece (2637 m), at least four glacial advances have been recognized and dated (Hughes et al. 2006), with frequent warmer cycles favoring, most probably after ca 70 ka, the repeated presence of Neanderthal hunters between 1500 and 2300 m of altitude (Biagi et al. 2016).

In the Caucasus, the presence of Mousterian artifacts in high-altitude sites located well above 1000 m shows that palaeoclimatic changes took place in a way similar to those known from other parts of Europe and produced comparable ecological changes since the beginning of the Pleistocene (Amirkhanov 2016). However, number and frequency of sites throughout the Late Pleistocene and the Holocene show that the same region was widely crossed by both ancient hominids and modern humans in search for raw materials, practicing hunting and probably gathering and, later, agricultural and farming activities. To sum up, also in the Caucasus, like elsewhere, mountains represent in most cases a link, and not a barrier between different regions as the richness of high-altitude discoveries demonstrate.

Current Debates

The Alps

The importance of high-altitude landscapes in prehistory started to become clear around the middle of the 1800s, thanks to the unexpected discovery of Neolithic and Bronze Age wooden pile dwellings at Obermehler, along the shores of Lake Zürich in Switzerland (Keller 1866). However, the study of Alpine archaeology greatly developed since the beginning of the 1970s, following the 1969 discovery of a few important rock shelter sequences at Romagnano III, Vatte di Zambana, and Pradestel in the Adige Valley near Trento, in northeastern Italy, that covers the entire Holocene from the Early Mesolithic to the Roman period. These finds showed for the first time the existence of valley bottom sites settled in prehistoric and also historic times, which were later buried by meters of alluvium transported by fluvial conoids. This fact was absolutely unknown to all archaeologists until those times. The new finds helped revise the general impression that most archaeologists had developed in Northern Italy during the last century, according to which the Mesolithic hunter-gatherers had never settled anywhere in the entire region with the exception of the Trieste Karst. It is important to repeat once more that before the end of the 1960s, the general assumption was that the Alps had never been settled before the metal ages and the Roman conquest. Moreover, following the aforementioned discoveries, most prehistorians started to compare the "newly available" knapped stone assemblages with those well known from the Mesolithic sequences of neighboring France and utilize the same terminology to describe and attribute them to the same cultural aspects. These discoveries were followed, in 1970, by those of high-altitude Mesolithic camps located along the shores of small glacial basins, close to alpine passes connecting important communication routes, in the inner alpine chain of the same Trentino region (Fig. 2).

High-Altitude Archaeology in Southeastern Europe, Fig. 2 Excavations underway at the high-altitude Mesolithic site of Laghetti del Crestoso in the Central Italian Alps. (Photograph by P. Biagi, 1988)

A few years later, international round tables and congresses on mountain archaeology started to be organized in Northern Italy and their proceedings to be published in different local and international journals. Their scope was to discuss and update the results already achieved and improve the quality of the research to organize in the years to follow (see Biagi and Nandris 1994).

This is why before those years, almost nothing was known of the prehistory of the alpine valleys and their surrounding highlands in the periods that followed the Late Pleistocene deglaciation. The same can be said of the reasons why, the modes how, and the times during which the Alps began to be settled in prehistory. In effect nobody had any idea of the great archaeological potential of the alpine chain, and the mountains in general, except for the role they had played during the Iron Age, the Roman, and Medieval periods (Pauli 1984) mainly for the exploitation of important mineral resources. Among them are salt (Kern et al. 2009) and copper, whose presence has been reported by classical and postclassical authors. At present we know that the Alps were undoubtedly (seasonally) settled by Mousterian hunters during the Middle Palaeolithic, though in many cases the traces they left are ephemeral, sometimes consisting of isolated tools, or have been destroyed by repeated ice movements.

During the milder Allerød interstadial, we assist at the first seasonal settling of the Alps by last hunter-gatherers. This fact took place toward the end of the Late Palaeolithic, around the beginning of the definitive retreat of the Late Pleistocene glaciers. Roughly during the same times, studies on the human impact on the alpine highland zone ecosystems started to develop. Their scope was the reconstruction of the alpine environment exploited by groups of mobile hunter-gatherers at high altitudes, their settlement pattern, and the interpretation of the relationships with their complementary low-altitude base camps.

In this respect the presence of rock-art engravings, in Valcamonica, for instance, played an important role in the interpretation of different aspects of human life in a wide alpine valley. According to the experts in this field, their earliest appearance is most probably to be referred to the end of the Late Palaeolithic, though they became far more important and numerous during the Copper, Bronze, and the Iron Ages (Fig. 3) (Pini et al. 2016). During these latter periods, human representations, scenes of daily life, house structure types, cultivated fields, weapons, and sacred images form complex engraved patterns on the rocks rounded and striated by glacial action.

Since the 1970s our knowledge has greatly improved not only in Northern Italy but all over

the Alpine arc, though highland zone research strategies and subsequent discoveries greatly varied country by country. The differences are mainly due to the characteristics of the natural resources, the great landscape variability of the mountain regions, the results achieved by excavations carried out in several countries (Fig. 4), the quality and quantity of published sites and materials, and the improving number of radiocarbon dates from both settlements and pollen cores extracted from neighboring peat-bog deposits. Thanks to the study of the lithic resources, trade models were developed regarding mostly chert and "greenstones," both of which are abundant in some well-defined zones of the Alps and the pre-Alps due to the richness of the raw material sources. Chert, hyaline quartz, and greenstones undoubtedly played a very important role in the prehistory of Northern Italy. They both were traded also across the Alps in different periods, according to different modalities.

Regarding chert, much effort has been paid to the study of the rich Lessini Hills sources and their mines located along the Alpine foothills of western Veneto near Verona. They were exploited already from the Palaeolithic, though mainly between the Early Neolithic and the Bronze Age. During these periods, many varieties of Lessini chert, mined or collected from well-defined outcrops, were traded throughout the Po Valley, even across the Ligurian Apennine/Alpine chain down to the Neolithic cave sites of the Finalese, close to the Ligurian Sea coastline (see Fig. 1, n. 10).

Moreover, also the western alpine high-pressure metaophiolithes rocks commonly named "greenstones" played a very important role in these periods. Greenstone artifacts were traded from the primary sources of Piedmont (Mt. Viso or Monviso) and Liguria (Voltri Group) and from secondary Oligocene deposits, according to models that are becoming more and more clear, thanks to the results obtained from highly refined scientific analyses and the typological study of polished stone tools from well-dated complexes, among which are axes, adzes, chisels, ring stones, and unique, ultra-polished ceremonial

implements (Pétrequin et al. 2012; Váczi et al. 2019). The distribution of polished stone artifacts are to be framed within a wider network system that regard also the trade of shell ornaments of Mediterranean origin, mainly *Spondylus* artifacts, among which are different types of beads and bracelets. These latter are known mainly from Neolithic and Copper Age settlements and graveyards excavated along the fringes of both sides of the Alps and from sites located well inside valleys of great trans-Alpine communication, among which is the Adige Valley of Trentino-South Tyrol (Séfériadès 1995).

The Carpathians

Located midway between Central and Southeastern Europe, the Carpathians are the second extensive mountain system in Europe. They form a large semicircle, over 1500 kms long that starts from Southern Poland, in the north, down to the lower Danube, in Romania. Though they are not dotted with impressive peaks, given that the highest mountains reach ca 2500 of altitude, their geographic location across the Balkan Peninsula always played a very important role in the prehistory of Europe since at least the Middle Palaeolithic period. The Danube, which separates them from the Alps, crosses the Carpathians throughout a narrow, winding gorge called the Iron Gates (Djerdap), between Romania and Serbia (Fig. 5). Politically this is a very important region that was always contended by the three great empires of the eighteenth century (Ottoman, Russian, and Austro-Hungarian), similarly to what happened ca 2000 years between the Romans and their facing enemy Dacian tribes, because of its strategic importance as a compulsory passage along a natural route linking Anatolia and its surrounding Aegean and Black Seas, in the south, with Central Europe, in the north. It is not a case that many prehistoric, classic, and more recent archaeological sites are located along the Iron Gates, among which Lepenski Vir is undoubtedly the most important and famous (Bonsall et al. 2015). The gorges

High-Altitude Archaeology in Southeastern Europe, Fig. 5 The Iron Gates (Djerdap) from the Serbian side of the gorge at Lepenski Vir. (Photograph by P. Biagi, 2006)

represent the easiest way to move across the Carpathians, although other minor passages do exist, for instance, along the course of the Olt River, to reach the Mureş Valley that flows inside the Carpathian Basin of lower Transylvania, down to the Danube River farther west.

It is well known that the Balkans, and the Carpathians in particular, have always represented a route along which transhumant shepherds moved until World War II to reach the Dinaric Alps, the Trieste, and Slovene Karst, though their roots are most probably to be searched in later prehistoric and classic times (Nandris 1985). Moreover, the Carpathians are rich in natural resources that were exploited in different periods of prehistory, whose outcrops are sometimes easy to identify: obsidian and salt in particular. At present, the locations of the three main north Carpathian obsidian sources are well known and characterized, though their scientific study started to attract the attention of archaeologists already in the 1970s. In contrast, the study of the salt sources developed mainly during the last 20 years. Their rich exploitation sites remark the important role played by this mineral in the economy of the south Balkan settlements at least since the beginning of the Early Neolithic Criş culture, mainly in Romania and Moldova (Brigand and Weller 2018).

These were not the only two important resources that were traded across the study region and beyond. Among the others we have to stress our attention toward at least three other important raw materials, namely, gold, copper, and Volhynian/Prut flint, whose sources are located in northwestern Ukraine along the course of the Prut River. The production, circulation, and trade of objects made from these materials within the Carpathian basin and outside it clearly show that these mountains did not act as a barrier; in contrast people systematically moved their goods across this chain, developing contacts that were activated at least since the end of the Neolithic onward. This fact is exemplified by the presence of different raw materials of both Carpathian and Transcarpathian origin involving, among others, sites where precious gold items were manufactured (Fig. 6). They show the importance of these materials at least since the beginning of the Copper Age. They were undoubtedly traded following a complex trade network that moves at least in two different directions, from north to south and west to east. In particular copper was mined to manufacture not only ornaments but also functional tools among which are different types of axes and other weapons that were recovered from hoards, burials, and settlements.

High-Altitude Archaeology in Southeastern Europe, Fig. 6 Excavations underway at the Cave Peştera Ungurească in the Cheile Turzii gorge near Turda in Transylvania (Romania) whose Chalcolithic deposits yielded evidence of gold smelting, Carpathian obsidian, and Volhynian/Prut chert artifacts. The Pindus

The Pindus range runs for ca. 200 km covering part of Albania, Northern Greece, and Macedonia, reaching the maximum altitude of 2637 m at Mt. Smolikas, in Western Macedonia. Due to its steep uneven slopes, its location between the short coastal Ionian Sea plain, and the wider lowlands of Thessaly and Western Macedonia, in the east, for long these mountains have been considered repulsive for prehistoric settlement of any age. Within the same mountain range, Lakes Ohrid and Prespa are the largest basins in the region, while along the south shore of Lake Kastorià, in Western Macedonia, is located the famous settlement of Dispiliò. Together with other villages discovered around Lake Maliq, in Albania, and Ohrid, in Macedonia, Dispiliò is one of the few prehistoric lake dwellings so far known in the Balkans.

Archaeological research has been seldom carried out in the remote Pindus range, with the exception of the archaeological program promoted by the University of Cambridge in Epirus during the 1960s, whose scope was the excavation of a few Palaeolithic rock shelters and the definition of the chronological sequence of the Middle Palaeolithic assemblages of this difficult mountain landscape (Higgs and Vita-Finzi 1966). However, there are many reasons that might have attracted hunters, gatherers, farmers, and shepherds along and around its slopes in different times. The high-altitude landscapes of the Pindus are scattered with small basins and ponds that provide not only insights of the human presence since the Middle Palaeolithic but also excellent potential sources for climatic and palaeoenvironmental reconstructions. Rich of springs and water, the eastern side of the chain is crossed by many steep valleys among which is that of the Aliakmon River, with red Pleistocene palaeosols along its terraces. Its course gives access to different mineral resources exploited in prehistory (greenstones, radiolarites, chert), as well as to the fertile high pastures, well known for many centuries to Arômani speaking Vlach transhumant shepherds (Wace and Thompson 1914).

Due to its southern location and its modest elevation, the range did not know the extreme climatic changes that affected the Alps during the Quaternary. However, glacial and periglacial morphologies have been identified and, in some ways, correlated to those of the Alps (Hughes et al. 2006). The oldest moraine in the Tymphi-Smolikas district dated by U-series isotopes predates 350 ka BP and includes at its top Levallois Mousterian industries around Smixi, at ca 1350 m of altitude (Fig. 7).

In this area the small town of Samarina is well known for earlier French and American ethnoarchaeological research on Vlach transhumant shepherds. Recent surveys have been successful in recovering, along the terraces that face the Samariniotikos River and the surrounding ridges up to 2300 m, many traces left by Middle Palaeolithic hunters, with their base camps and knapping sites (Fig. 8), hunting paths, and exploited good-quality chert outcrops over a radius of ca 30 km from the "residential" sites located along the river terraces (Biagi et al. 2016).

Though most of the prehistoric sites around the Samarina Mountains and watercourses consist of typical Middle Palaeolithic Levallois Mousterian assemblages, the same region yielded also many evidences of frequentation belonging to other prehistoric periods, among which are Late Neolithic scatters of lithic tools, as well as radiocarbon-dated Bronze Age sites and chert arrowheads attributable to the same period. Regarding the Bronze Age sites, they are often strategically located on top of high mountain peaks, because their scope was to control the lower-lying river valleys that move down to both the Aegean and Ionian Seas and pasture lands. The systematic recurrence of Bronze Age arrowheads, made from exogenous chert, shows that high-altitude footpaths were already in use during that period, and hunting was sometimes practiced also in the uplands around Samarina. During the Bronze Age, the first traces of deforestation have been radiocarbon-dated from tree pits discovered on the surface of the terrace that extends behind Samarina itself. The systematic radiocarbon dating of many such features has shown that deforestation continued to be practiced throughout historic and more recent periods, most probably to open pastures to move Vlach shepherds'

flocks, as also reported by A.J.B Wace and M.S. Thompson for subrecent, historic periods (Wace and Thompson 1914: 45).

The Caucasus

Recently, the unexpected discovery of a few high-altitude, open-air Early Palaeolithic sites has highlighted the importance of the Caucasus as a route followed by ancient hominids moving "out of Africa" toward Europe and Asia somewhat before 2 Myr ago throughout the so-called Caspian corridor (Amirkhanov 2016: Fig. 24). The sites yielded rich, typical Oldowan knapped stone assemblages made from local rocks, characterized by different types of cores, choppers, and flakes, associated with identifiable faunal remains that were often uncovered in a very good state of preservation at least at Dmanisi in Georgia (Fig. 9).

As elsewhere in the high mountains of Europe, Caucasus archaeology knew since long traditional survey techniques, i.e., field walking. Although this method has been questioned even by some archaeologists on the ground that uplands are prone to erosion and loss of documentation, nevertheless, it is still to be considered one of the fundamental ways to inspect the minute signs of humane presence also in the highland zones (Gassiot Ballbè et al. 2016). Since the times of large-scale surveys organized in the 1930s by B.A. Kuftin in the Tsalka/Trialeti region, this methodology has improved to a very high standard. This is shown by the impressive results recently obtained in the Samtskhe-Javakheti province of Georgia (Anderson et al. 2014). However, it is true that new techniques can greatly contribute to new discoveries. In recent years, the mountains of the Caucasus have acted as an excellent

High-Altitude Archaeology in Southeastern Europe, Fig. 8 A view of the Samariniòtikos River and the terraces on which Mousterian Levallois sites are located along its right bank, from La Greklu, in the Pindus range of Western Macedonia. (Photograph by P. Biagi, 2017)

laboratory to test new prospection methods of remote sensing such as aerial satellite and drone photography to detect, for instance, elusive features among which are prehistoric pastoral sites or semi-subterranean dwellings in such even topographies as the Northern Caucasus (Reinhold et al. 2016). For example, high-resolution satellite images confirmed previous terrain survey discoveries of hundreds of obsidian mining pits along the slopes of Mt. Chikiani volcano in the Lesser Caucasus Javakheti plateau of Georgia, otherwise invisible from the ground.

The Holocene prehistory of the Caucasus is strictly connected to northern steppe plains and the Near East at least since the Mesolithic. In this region, the presence of the last Early Holocene hunter-gatherers is known almost exclusively from caves and rock shelters excavated in Georgia, Abkhazia, Armenia, and Dagestan (Bader and Zereteli 1989). Hunting equids, bisons, and occasionally water birds (Bavra) represent the only documented subsistence economy, as no evidence of edible vegetables has ever been recorded from any archaeological site.

Farming makes its appearance around 7000 BP and quickly spread to the north. The sites of this period are often located along the course of the Kura River. The Early Neolithic settlements of the Shomutepe-Shulaveri culture show evidence of cereals (barley, wheat, legumes, and grapes) along with domesticated herbivores. The sedentary villages of this culture, among which are those of Aruchlo, in Georgia, and Göytepe in western Azerbaijan, are characterized by groups of walled, mud-brick circular buildings of different sizes (Chataigner et al. 2014). The first pastoral groups inhabited the plateaus of south Caucasia and the steppe zone north of the Caucasus as early as the late sixth millennium BP, though only from the middle of the fourth millennium BP onward, we assist at an intensive exploitation of the steppe and mountain pastures. The

High-Altitude Archaeology in Southeastern Europe, Fig. 9 The Early Palaeolithic site of Muhkai 2 in Dagestan, in the foreground (above), and a chert chopper tool from the same site (below). (After Amirkhanov 2016: figs. 16 and 54)

opening up of the steppes has long been associated with the development of a mobile, pastoral way of life (Shishlina 2013). New technologies, in particular wheeled transport, and most likely horsemanship, fostered this process with its increasing demands for new large pastures. Moreover, the recent discovery of complex systems of different types of field terraces between 600 and 2600 m of altitude, along the slopes of the northern Caucasus in south Russia, opens new perspectives to the study of the prehistoric and historic agriculture practiced between the Copper Age and the Medieval period. This latter was practiced by Alani tribes that left impressive traces of their subsistence economy structures on the landscape (Korobov and Borisov 2013). In this respect we do not have to forget that, already in the Copper Age, the Caucasian mountains saw the first presence of complex agricultural implements among which are wooden threshing sledges with chert inserts that have sometimes recovered still intact inside grave-pits just below skeletal remains. This fact points out the importance that agriculture played in the region at least since the beginning of the Copper Age period, if not before (Skakun 2003).

The best-known Late Chalcolithic-Bronze Age culture in the Caucasus is the Kura-Araxes, whose

High-Altitude Archaeology in Southeastern Europe, Fig. 10 Monumental corridor *kurgan* in the Javakheti highland near Mt. Chikiani in the Lesser Caucasus of Georgia. (Drone photograph by R. Nisbet, 2017)

radiocarbon chronology falls roughly between 5200 and 4200 BP. Different types of monumental burials (*kurgans*) started to be built during the Chalcolithic as symbols of social differentiation (Fig. 10). The Kura-Araxes *kurgans* hold impressive wooden collective burial chambers inside which prestige goods are usually absent, though they have been interpreted as a sign of egalitarian funerary ideology (Kohl 2007: 57–124).

The search for ores in the mountains was intense in this period, though also knappable stone resources continued to be exploited during the development of a complex Bronze Age society that largely employed bronze to produce a great variety of everyday life objects, sophisticated weapons, and ornaments. Along the slopes of Mt. Chikiani volcano, northeast of Lake Paravani, well above 2000 m of altitude, this led to a large exploitation of obsidian (Fig. 11), with the opening of many hundred extraction pits inside different lava flows that formed well over 2 Myr ago, the presence of workshops, circular stone platforms on which knapping took place, villages with rows of semisubterranean houses, impressive long alignments of large stone boulders, *menhirs*, quarries, and many hundreds of tombs covered by obsidian and andesite blocks, scattered along the mountain slopes (Biagi and Nisbet 2018). Chikiani obsidian was traded all over Caucasus since the end of the Middle Palaeolithic period onward, down to the Neolithic settlements located along the eastern shores of the Black Sea, in order to supply sites located even more than 400 kms away.

Discussion

Though very different in their geography and geological and climatologic history, the mountain ranges discussed above share some important common elements regarding the role they played in prehistory, which hide the reasons why men discovered, approached, and later settled them. As far as we know from the study of the material culture remains brought to light during decades of high-altitude surveys and excavations and the geological richness of the natural mountain deposits, mountains were often frequented, though in different times and for different economic and cultural reasons, to exploit raw

High-Altitude Archaeology in Southeastern Europe, Fig. 11 Obsidian deposit exposed along the slope of Mt. Chikiani in the Lesser Caucasus of Georgia north-east of Lake Paravani. (Photograph by P. Biagi, 2005)

material sources. They are represented mainly by obsidian, ores, and salt in the Caucasus; chert and radiolarite in the Pindus; salt, obsidian, and gold in the Carpathians; and chert, greenstones, salt, and also copper in the Alps, together with many more minerals and rocks, among which are chalk, soapstone, hyaline quartz, hornfels, basalts, etc. whose mining is suggested to have involved communication with supernatural powers as well as pecking images into the rock itself. In this respect, copper played a major role mainly during the Copper Age also in the Apennines and the Alps of Northern Italy, France, and Austria. During this period, lasting ca one millennium, a great variety of copper battle axes were manufactured smelting almost pure ore, sometimes containing arsenic or silver impurities that were circulated following still difficult-to-define trade routes. Their shape and dimension varied culture by culture, though they seem to reproduce original polished stone specimens (Sherratt 1976).

In addition, mountains are considered to be reservoirs of game animals since the Palaeolithic, and, in more recent periods, they offered the best pastures to pastoral economies, a role they still play nowadays. In comparison with the uniform, densely forested plains, the alleged difficulties of access to steep slopes are widely counterbalanced by the variety of diverse ecosystems, rapid changes in exposure and microclimate, good visibility over the landscape above the tree line, clearings providing excellent hunting spaces, as well as edible seeds and fruits. All over the world, mountains have been reached, explored, and settled in different times and for different reasons, not always necessarily only for functional or economic reasons. Prehistoric human presence in this challenging environment leaves recognizable signs that offer a ground for investigation to both archaeologists and palaeoecologists, to answer to the many questions arising in mountain archaeology: when, why, and how men began to settle in

highland zones; what type of pathways were chosen or created to reach them along slopes and ridges, though always following the easiest way; why they decided or were forced to move away; and how could they control and manage this environment so prone to erosion, loss of soil, and instability?

We know that mountains are not only places where to live but also where to die and sacrifice to gods and goddesses. In this respect, megalithism is a sort of communication with known or unknown forces, which is commonly found in the uplands, where monuments sometimes follow a precise orientation whose meaning is often difficult to suggest. In the mountains we have evidence of tombs made of simple heaps of pebbles, or monumental *kurgans* with one or several bodies buried according to well-planned rituals into spectacular wooden chambers together with chariots and horses (at least in the Caucasus), large richly-decorated stele-statues used as gravestone, *menhirs*, engraved surfaces on Alpine rocks, as for example, in the Valcamonica in the Central Alps and the Vallée des Merveilles (Mt. Bego) in the Western Alps of France (Lumley de and Échassoux 2011). The latter was settled from the end of the Palaeolithic period to the Bronze Age up to an altitude of more than 2500 m. Here an impressive number of many hundred thousand figures, symbols, cup marks, representations of specific tools and weapons, huts, animals, scenes of daily life, and probable divinities are only an example of the rich ideological relationships that undoubtedly existed between men, rocks, and mountains.

To sum up, the new evidence collected during the last decades of upland archaeology activities in different parts of the world substantially changed the old assumption according to which man had never inhabited high mountain ranges in prehistory and, more specifically, before historic periods, since the mountain ecosystem was considered a "marginal" one within the general pattern of traditional archaeology. In contrast, at present it is clear that the archaeological record of high-altitude human activity depends on many factors, among which are visibility and the state of preservation of the sites, the presence of particular resources, and the methods employed to conduct research.

Mountain archaeology is indeed challenged by difficult environmental conditions. Archaeologists have to move up- and downslopes and walk for hours to operate in areas often difficult to reach by car and transport their equipment by foot on steep pathways. Moreover, it is a time-consuming and a particularly harsh type of fieldwork, considering that weather conditions can change dramatically from 1 h to the next. However, there is little doubt that the study of human adaptation to highland environments is a promising avenue of future research that deserves particular care and systematic, accurate methods of investigation.

Hillfort Investigations in the Czech Republic

Roman Křivánek
Institute of Archaeology of the Academy of Sciences of the Czech Republic, Prague, Czech Republic

Brief Definition of the Topic

The *hillfort* is one of Europe's best known types of pre- and protohistoric monument. Those found in the Czech Republic range in date over the Neolithic, Eneolithic, Bronze Age, Iron Age, Roman, and early medieval periods. Many of these sites have long been familiar in the landscape, but more have been identified or studied during various archaeological survey projects (e.g., Gojda et al. 2004; Křivánek 2004). They vary in size from 0.1–0.5 ha to 100–200 ha. They offer important information on the key roles they performed in each period: military bases, settlement, industry, trade, communications, agriculture, burial, cult, or other activities.

The traditional method of investigating hillforts was the excavated trench, and in this country attention was focused on Slavic and Celtic fortified sites. The new approach places the emphasis on *remote mapping*, making particular use of *aerial survey*, *geophysical survey*, and *surface collection*. *Geochemical mapping* and *metal detector* surveys have also been used in particular situations. The purpose is to obtain the maximum amount of information about the structure and date range of the site using nondestructive methods, before applying targeted excavation for the solution of particular historical problems. Some examples follow.

The prehistoric hillfort near Zlončice (district Mělník) was first identified from surface collections by an amateur regional archaeologist. Enclosure systems of 12–13 ha on a promontory by the Vltava river confirmed later results of geophysical prospection (Fig. 1a). A *magnetometric survey*

Hillfort Investigations in the Czech Republic,
Fig. 1 Zlončice, district Mělník. Combination of (**a**) vertical aerial photography (public web source www.mapy.cz) and (**b**) the result of magnetometric survey of prehistoric hillfort (terrain: plowed field and meadow; surveyed area: approx. 9.5 ha; magnetometric survey: Křivánek 2008–2010)

Hillfort Investigations in the Czech Republic, Fig. 2 Prague-Hostivař, district Prague 15. Comparison of old map (stable cadaster 1841), old site plan (Fillip 1949), and magnetometric survey of the Hallstatt hillfort (terrain: park; surveyed area: approx. 4.3 ha, magnetometric survey: Křivánek 2008)

subsequently revealed an intense level of occupation in the form of numerous pits and seven boundary ditches (Fig. 1b). Surface collection of artifacts suggested a Neolithic origin but with some later occupation (Křivánek 2011). Magnetometry also proved very effective at Libice (district Nymburk), an early medieval stronghold of 20 ha in a lowland area on a sand and gravel terrace on the flood plain of a meandering Jizera rives (Křivánek-Mařík 2009). The Hallstatt hillfort of Prague-Hostivař (district Prague 14) had more or less disappeared from view, but

Hillfort Investigations in the Czech Republic, Fig. 3 Lhota, district Prague-west. Combination of (**a**) aerial documentation. (Photo by M. Gojda, Inst. of Archaeology, Prague) and (**b**) magnetometric survey of plateau Balda in central part of La Téne oppidum Závist (terrain: hilly forest; surveyed area: approx. 1.1 ha, magnetometric survey: Křivánek 2005)

investigators made use of an early map and the cadastral boundary plan to locate the probable location of the fortified enclosure. The extent of occupation and the burnt out defenses were then located by magnetometry (Fig. 2).

The La Téne oppidum at Závist in cadaster Lhota (district Prague-west) represents a different type of large hillfort in the Czech landscape, on hilly terrain and now thickly wooded (Fig. 3a). This kind of terrain presents a challenge to

conventional methods of aerial and geophysical survey. Even so magnetometry was able to map part of the site on the plateau of Balda (Fig. 3b), showing ordered settlement, a burnt rampart, and evidence for later plowing (see also *Lidar*, *radar* for other possible approaches).

The new research initiatives applied to the study of hillforts, both known and previously unknown, in every type of terrain, are providing a systematic basis for understanding their structure and use in different periods. This information leads to proposals for intensive investigation at particular sites for research purposes and at the same time provides an overall inventory to assist in the long-term protection of these cultural (or archaeological) monuments.

Hispanic South America: Historical Archaeology

Mary Van Buren
Colorado State University, Fort Collins, CO, USA

Introduction

Historical archaeology is a relatively new discipline in South America, systematically practiced only since the 1980s. The small number of archaeologists specializing in the field and lack of venues for the creation of professional networks, as well as the fact that scholars live and work in nations with distinct histories, have impeded the emergence of overarching theoretical orientations or research agendas. Over the last twenty years, however, the historical archaeology of Hispanic South America has experienced a period of rapid growth and professionalization, including the development of specialized academic programs and institutes that train students and conduct research, regional and national conferences focused on the subfield, and both print- and web-based publications that facilitate communication among scholars (Funari et al. 2009). Historical archaeology is now a well-established field in Argentina, Venezuela, Chile, Uruguay, and Colombia and is emerging as a recognized discipline in other South American countries. While historical archaeologists have practiced in Brazil for decades and have interacted regularly with scholars in neighboring Argentina and Uruguay, their work is not discussed in this entry as it is restricted to Spanish-speaking countries.

Definition

The emergence of historical archaeology as an academic discipline has generated a number of debates about its purpose, disciplinary affiliation, and the nature of its sources. One ongoing issue is how historical archaeology should be defined. In both South and North America, the field's initial development was tied to the creation of

Eurocentric national histories. Excavations centered on sites associated with historical figures who played a role in official discourses and were almost always men of European descent. In addition, historical archaeology was defined as the study of archaeological remains in conjunction with written records, but non-Western societies, such as the Maya and Aztecs, were excluded, thus reinforcing the colonialist distinction between supposedly civilized Europeans and the people who were conquered by them.

One way that contemporary archaeologists have responded to the Eurocentric nature of the early history of the field is by proposing changes to the definition of historical archaeology. Some scholars have called for the inclusion of all literate societies in the subdiscipline. A more popular approach has been to employ Charles Orser's (1996) definition of the field's purview as the development of the modern world, a process that encompasses colonialism and the emergence of capitalism and one that involved all sectors of the population. Regardless of theoretical orientation, the majority of scholars working in South America today understand historical archaeology to be the study of societies that date from the beginning of European expansion about 500 years ago to the present, using material culture as well as texts, maps, paintings, and oral histories when available. Such an approach includes not only elite men of European descent but all people who contributed to the creation of contemporary South American societies.

Historical Background

The field of historical archaeology has followed a similar intellectual trajectory in many countries. The earliest studies in Hispanic South America were often the result of fortuitous discoveries and thus tangential to other objectives. Historical materials were sometimes encountered during construction activities in urban areas and as a consequence of excavations at pre-Hispanic sites. The formal development of the discipline was linked to cultural heritage management, usually the restoration of colonial churches and buildings associated with people who played salient roles in national history. Initially, this work was conducted by non-archaeologists, and reports were highly descriptive, with the primary aim being to document the building's original form and subsequent development or to corroborate information provided in documents. Spanish colonists and institutions were emphasized, in part because of the use of archaeology to instantiate national histories but also because of the urban focus of many of these projects. One of the earliest endeavors began in the 1940s when Augustín Zapata Gollán started excavations in Santa Fe la Vieja, Argentina, in order to prove that it was the location of the original city founded by the conquistadors (Zapata Gollán 1991). For the following three decades, archaeologists throughout Hispanic South America occasionally excavated colonial forts, churches, indigenous settlements, harbors, and houses, but the research was sporadic and usually unconnected to broader intellectual discourses.

The field of historical archaeology only crystallized during the 1980s. The rapid development of the discipline in the Southern Cone countries was a consequence – at least in part – of the fall of long-standing dictatorships (Funari et al. 2009). The reestablishment of democratic regimes resulted in an upsurge of intellectual creativity and, particularly in Argentina and Chile, stronger intellectual connections with foreign scholars. Research also became more explicitly framed by theory; concepts drawn from processual archaeology, the theoretical perspective that dominated the United States at the time, were briefly explored by some archaeologists, while others adopted versions of historical materialism, including *arqueología social*, an approach originally promulgated by Luis Lumbreras (1974) in Perú and further developed by Sanoja Obediente and Vargas Arena (2011) in Venezuela, among others. It was during this decade that a number of robust programs of archaeological inquiry were developed, especially in urban centers where municipalities helped support salvage excavations.

The subsequent 20 years witnessed the emergence of historical archaeology as a recognizable discipline in the Southern Cone countries as well

as in Venezuela and Colombia; the scope and number of research projects increased, symposia and conferences were devoted to the subject, and specialized courses were developed for undergraduate and, in some cases, graduate programs. Research also continued to become more explicitly theoretical, with Marxist and postmodern approaches being the most common perspectives. The development of this academic infrastructure resulted in the first generation of historical archaeologists who were specifically trained in the discipline, a key hallmark of professionalism.

Key Issues

From a continental perspective, the size of the professional community is now large enough to sustain an intellectual discourse regarding issues of interest to historical archaeologists, but this has not happened to any great extent. There are, therefore, few debates or research foci in which archaeologists across the continent – or even within regions – are mutually engaged. However, some commonalities exist due to similarities in the historical development of the field in different countries as well as their shared history as Spanish colonies.

Cultural Heritage Management

Cultural heritage management is still a mainstay of historical archaeology in South America, in part because funding for archaeological research is sometimes included in the budget for civil works and restoration projects. In addition, all countries now have laws regarding the protection of culturally significant sites, although enforcement is inconsistent. In contrast to the past, however, heritage management is now usually conducted by multidisciplinary teams that include archaeologists. Projects range from salvage work to mitigate the effects of infrastructural development such as the expansion of the metro in Santiago, Chile, to less common programs focused on the preservation and study of significant cultural properties. An outstanding example of the latter is the extensive research, conservation, and interpretation of the *área fundacional*, or historic core, of Mendoza, Argentina (Chiavazza 2005). This project, along with many others, attempts to address issues of anthropological and historical significance in addition to furnishing architectural data. Some scholars have even redefined the concept of historic site management to include the restoration of largely forgotten social histories to the collective memory (Therrien 1998) and the preservation of contemporary traditions that have colonial roots (Grupo de Estudio de Arqueología y Antropología Colonial in the Quebrada Humahuaca, Argentina), while others have extended the notion by engaging in public archaeology. As in most countries, though, heritage management usually entails salvage operations that yield purely descriptive information.

Colonial Archaeology

The investigation of colonial remains was the goal of most early historical archaeology in South America and continues to be important today. Churches, convents, and monasteries – structures associated with a crucial colonial institution and usually the most elaborate buildings of that time – have probably been excavated more than any other type of site. These projects have provided information about architecture and other types of material culture but often remain unpublished. The human remains found in cemeteries beneath or adjacent to these structures represent an important source of information about health, demography, and colonial mortuary practices but have rarely been analyzed. Important exceptions include Douglas Ubelaker's work in Quito (Ubelaker and Ripley 1999; Ubelaker and Newson 2002) and the more recent research by Haagen Klaus (Klaus and Tam 2010) on the coast of Peru.

Colonial archaeology has, however, moved far beyond its role as an aid to architectural construction and has yielded information about many issues of broader anthropological significance. Chief among these is an examination of how indigenous populations as well as European colonists were affected by the colonial experience. The conceptualization of this issue has changed over time, with earlier research based on an implicit model of passive culture change and

more recent work explicitly investigating the active negotiation of identity. Additional research foci include early urbanism, frontier expansion, the organization of extractive industries, dietary change, the reconfiguration of rural landscapes, and the local implementation of Spanish colonial policy. An important example of the last is Senatore's (2007) examination of Spanish attempts to control Patagonia. Floridablanca was a fortified agrarian community that was established on the colonial frontier in 1781 in accordance with Enlightenment ideas regarding order and equality. By examining the everyday social practices of the settlers, Senatore has shown how a very different kind of order was generated by local residents, thus highlighting the negotiated and uncertain outcomes of colonial rule. This emphasis on agency, practice, and historical contingency is a hallmark of the most recent research on the colonial period by both South American and foreign scholars.

With the exception of Ross Jamieson's study of the relationship between domestic architecture and power in Cuenca (Jamieson 2000), most archaeological research conducted by foreigners on historical sites in Hispanic South America focuses on the hinterlands. All of these projects consider the ways in which indigenous and European peoples negotiated the colonial experience. One of the earliest was an investigation of the wine industry in the Moquegua Valley of Peru by Prudence Rice (2011) and her students in the late 1980s. They examined the interchange of technologies between Spaniards and Andeans and the effects of colonization on diet, exchange, and other aspects of the economy. More recent investigations have examined the organization of silver mining, the reconfiguration of rural landscapes in the wake of conquest, the impact of Western goods on indigenous practices and systems of value, and the interaction of Dominican friars with the population of an early *reducción*, or indigenous community resettled by the Spaniards. In addition, a new cohort of foreign and local scholars working in Peru is beginning the study of *haciendas*, or large agricultural estates, which has been a notable lacuna in colonial research.

Urban Archaeology

Urban phenomena have been the focus of much of the historical archaeology conducted in South America, in large part because of the discipline's involvement in the management of architecturally significant cultural properties, which tend to be located in cities. Most notable are the Buenos Aires Urban Archaeology Project (Schávelzon 2000), the San Francisco Ruins Project in Mendoza (Chiavazza 2005), the Urban Archaeology Project in Caracas, and the Colonia del Sacramento project in Uruguay (Fusco 1997). Smaller projects have also been carried out in Bogotá, Cartagena, Cuenca, Quito, and Lima. All of these initially focused on colonial remains.

By the 1990s, urban archaeology had become a distinct subdiscipline with its own techniques, opportunities, and limitations. Chief among the latter is the opportunistic nature of excavations that are usually carried out in advance of construction activities, making it difficult to excavate according to a preconceived research design. This constraint is overcome, to some extent, by the accumulation of data over time. The use of data sets from sites used during different periods has also allowed some investigators to produce long-term urban histories that extend from early colonial to republican times. Daniel Schávelzon directs one of the most productive and longest running projects of this type in Buenos Aires. He and his colleagues have produced fundamental descriptive information about the material culture of Buenos Aires, including a catalogue of ceramics from Buenos Aires that date from the sixteenth to the twentieth century (Schávelzon 2001). They have also investigated such diverse issues as the development of residential structures, the complex history of food and drink, and the archaeology of class, ethnicity, race, and gender (Schávelzon 2000). Of particular importance is Schávelzon's history of the African-American population in Buenos Aires, as the African diaspora has received little archaeological attention outside Brazil (Schávelzon 2003). In Venezuela, Sanoja and Vargas (2008) have taken advantage of the rich data sets there to compare urban development in three regions of the country. They point to differences in these trajectories, which they

attribute to unique historical conditions that shaped their incorporation into the globalizing capitalist economy. Exploring diversity as well as the commonalities among different cities and regions is one of the important next steps in the historical archaeology of the continent.

The Archaeology of Republican and Modern Sites

In the 1980s, historical archaeology in South America was practically synonymous with colonial archaeology, but over the last decade, scholars have investigated a variety of sites dating to the nineteenth and twentieth century. These projects are diverse, but three bodies of research stand out. One of the earliest to emerge was the investigation of nineteenth-century forts on the pampas of Argentina. These forts were constructed as the Argentine state expanded into indigenous territories and were meant to protect roads linking Buenos Aires with other Argentine cities. Research at these sites has included analysis of the strategies used by the state to conquer the region, the ways in which garrison personnel adapted to local conditions, and the relationships between personnel and indigenous groups (Zarankin and Salerno 2008).

The nineteenth century also witnessed the development of industrial capitalism, which manifested itself in South America in different ways. Monika Therrien (2007) directed a multidisciplinary investigation of a ceramic factory that was established in Bogotá by Colombian entrepreneurs shortly after Independence. This work included interviews with families who currently live on the property, an experience that has led her to both defend the importance of industrial patrimony and to challenge plans to remove the inhabitants in order to construct a museum on the site. Far to the south, nitrate production became an important industrial activity in Chile's Atacama Desert during the late nineteenth and early twentieth century. The first archaeological study of a nitrate plant was published in 1984, and after a lull of more than a decade, the industry is once again being investigated on the basis of survey, excavation, documentary records, and oral histories. This research centers on the experience of workers in a developing capitalist economy and links the past to the present through interviews with living people.

Finally, a number of researchers have turned their attention to the archaeology of the modern world. Some, drawing on Foucault, have analyzed the relationship between the architecture of institutions such as schools and the daily routines of discipline and surveillance that are practiced in them. Others have studied the detention centers used by twentieth-century military regimes to incarcerate political prisoners. By examining architecture, graffiti, and other kinds of material culture, these scholars can reveal both the means by which inmates were controlled and the ways in which these were resisted.

International Perspectives

Historical archaeology has followed the same general trajectory in Hispanic South America as it has in many other regions of the world, but the development of the field has been shaped by distinct aspects of regional history such as shared colonial and postcolonial experiences, as well as conditions at a national level, including differences in resources between wealthy and poor states. Thus, some countries, such as Argentina, have a well-trained cadre of historical archaeologists, many of whom have been educated in specialized doctoral programs and who enjoy a professional infrastructure that includes journals, conferences, research institutes, and funding opportunities. In Bolivia, on the other hand, only a handful of students have graduated with the equivalent of an undergraduate degree accompanied by a thesis that focused on historical archaeology, and no institutions specifically support training or research in the field. Most countries fall in the middle of this range, and thus the development of professional infrastructure as well as fundamental research tools such as artifact chronologies are still in progress.

A related challenge faced by archaeologists working in this region is the continuing destruction of the archaeological record. This is a problem in all countries but one that is exacerbated in

South America by the lack of resources and inconsistent application of heritage management laws. Rather than being normal practice, enforcement usually occurs only in exceptional cases, either at sites that have already been declared national monuments or in cases where communities have protested the destruction of local sites.

The current position of South American countries in the modern global political economy, however, also presents an opportunity that has not been adequately explored. The relative lack of wealth and political influence that characterize most countries on the continent makes the legacy of colonialism palpable and has promoted continuity in many traditional practices. These factors could facilitate the creation of theoretical perspectives framed by the distinctive experiences of the "global south" in the process of modernization in counterpoint to the conceptual schemes produced by scholars working in the United States. These conditions also generate similar interests among archaeologists, cultural anthropologists, sociologists, and historians, points of intersection that could serve as the basis for interdisciplinary research.

Future Directions

Over the last three decades, historical archaeology has developed into a fully professionalized field in some South American countries, while in others it has not yet emerged as a formal discipline. This unevenness is due primarily to differences in resources and will not be remedied unless the underlying economic conditions change. Nonetheless, the field continues to develop throughout the region and will attract increasing numbers of foreign and domestic scholars.

The archaeological study of nineteenth-century capitalism will undoubtedly grow as mining, rubber production, railways, and other industries are explored. This process will also link the subjects of archaeological research more closely to the concerns and memories of the contemporary population, enhancing opportunities for public outreach and collaboration with descendant communities.

Historic Building Conservation: Current Approaches

Daniel Schávelzon
Center for Urban Archaeology, University of Buenos Aires, Buenos Aires, Argentina

Brief Definition of the Topic

The twentieth century has seen changes in the way historic buildings are treated, from reconstruction to restoration and on to conservation. The development of specialized techniques and products makes it easier for professionals to maintain the material integrity of a construction, something that was not feasible 20 years ago. Current trends center around the training of specialists and research into new low-cost products that make it possible to act to prevent major interventions or replacements of the materials in historic buildings.

The conservation of historic buildings has changed over time and rapidly so in the late

twentieth century. The first generations were people with an art history or architectural history perspective concerned with maintaining buildings exactly as they supposed they had been originally. Without specialized technical knowledge, which was only just coming into being, their work was characterized by the replacement of the deteriorated or missing part by trying to make an exact but modern copy of what they supposed had existed. Materiality was not important itself but rather that it resembled what had been there before, whether or not this had actually existed. This trend still exists in many countries. But the advance of applied chemistry and physics to knowledge of materials, in addition to the professionalization of architects especially and now professional preservers and buildings archaeologists, led to the generation of theories that centered on preservation rather than restoration. It was cheaper and simpler to take precautionary measures than to allow a building to deteriorate and then fix it. In addition, theories demonstrated that architecture is not just walls and floors, it is also the historicity and significance that these possess; hence replacement, reconstruction, or building can only occur in extreme cases resulting from unintentional destruction, such as from wars.

Today there are nonintrusive methods that make it possible to observe the processes of deterioration of the stone or masonry, understand their problems, and resolve them with low-cost techniques. This sometimes means specialized knowledge and laboratory products, but these can be found in the market. This has changed conservation throughout most of the world since 1980. Likewise, the progress of international bodies such as UNESCO and the creation of national institutions formed by professionals, and not just art and history lovers, have gradually made preservation possible as a habitual action.

The central problems that have marked different policies are the differences in the level of economic development or levels of investment and interest in maintaining the past or certain material facts from the past. Hence there are cities that continue to prefer the building of highways and others that give priority to pedestrians, not out of ignorance but as conscious decisions about their priorities, as the result of different histories. Today it is understood that many variants of preservation forms were already established by the end of the Second World War when bombed-out European cities opted for paths that may seem opposed: Warsaw was rebuilt stone by stone, while Rotterdam was rebuilt as new; Hamburg preserved all that was not destroyed, and Berlin and Cologne rebuilt buildings of which only the shells or foundations remained. These variants are present today, with continuing controversy and marking different paths. Perhaps the example of ancient Japanese architecture, where for centuries every piece of wood that deteriorates has been replaced, cutting it in the same way, with the same tools; painting it with the same colors; and joining it all together without nails. Nothing remains of the original example, nor is it possible to know what it looked like, but the spirit, the form, and the builder's way of relating to the building have not been altered. That is to say, there are many varied ways, something which generates conflicts with ideas of globalization and the high consumption of industrial products that are encouraged at present.

Historic Jamestowne

Audrey Horning
Queen's University Belfast, Belfast, Northern Ireland, UK

Basic Information

Historic Jamestowne is the official name given to the site of Jamestown, Virginia, England's first permanent New World colony. Jointly administered by the National Park Service and the Colonial Williamsburg Foundation on behalf of Preservation Virginia, Historic Jamestown is located approximately 45 km inland from the Chesapeake Bay on the James River and was settled by the English in 1607. Jamestown served as the capital of Virginia until 1699, when the seat of government moved to nearby Williamsburg. Jamestown has been the site of archaeological excavations since the 1890s and therefore holds a significant place in the development of historical archaeology. Presentation of the site is facilitated through a series of indoor and outdoor exhibits and ongoing archaeological excavations.

In 1994, archaeologists working on the 22.5 acre property owned by the Association for the Preservation of Virginia Antiquities (now Preservation Virginia) discovered traces of the fort constructed in 1607. Visitors to Historic Jamestowne can see the displays about the fort excavations in the Nathalie P. and Alan M. Voorhees Archaearium (Straube 2007). Special tours are available in the archaeological labs, and in the warmer months of the year, visitors can watch the excavations taking place. Adjacent to the excavation area is a reconstructed church and its original seventeenth-century brick church tower. Several structures relating to the early years of the fort have been partially reconstructed. Portions of an earthen Civil War fortification also survive on the Preservation Virginia land. Information about Jamestown Rediscovery can be found online at https://www.historicjamestowne.org/.

On the National Park Service property (1,500 acres), a visitor center highlights the history of the site and the results of over a century's worth of archaeological investigations and also incorporates displays about the history and current activities of Virginia's state-recognized Indian tribes. Outside, paths lead through the New Towne area (the portion of Jamestown settled after 1618) where archaeological features are interpreted through display panels and low brick outlines. A five-mile loop road takes visitors around the remainder of the island, where pull-in places feature displays on the natural and human history of the island over the past 10,000 years. Glassblowers demonstrate seventeenth-century techniques in a reconstructed glasshouse. Information about the Park Service property and displays at Jamestown can be found online at http://www.nps.gov/jame/index.htm.

Major Impact

Long celebrated as the birthplace of English-speaking America, Jamestown is also the birthplace of modern historical archaeology. The first excavations took place in the 1890s in advance of the reconstruction of the brick church and were followed in the 1930s by a major government-sponsored initiative that drew upon the labor of Civilian Conservation Corps volunteers. Directed by Jean C. "Pinky" Harrington, the 1930s investigations pinpointed the locations of 52 buildings in the townsite and pioneered the analysis of historic material culture. In the 1950s, another US government-sponsored project led by John Cotter employed extensive linear trenching across the townsite and exposed domestic, military, and manufacturing structures as well as a range of landscape features (Cotter 1958). Preparations for the 2007 four hundredth anniversary of the settlement of Jamestown led to two further projects in the 1990s. The Jamestown Archaeological Assessment (JAA), sponsored by the National

Park Service in cooperation with the Colonial Williamsburg Foundation, took an interdisciplinary approach to assessing all cultural resources on the island (Brown and Horning 2006). A full survey pinpointed 58 new sites, attesting to Native American activity from the Archaic through late Woodland periods as well as previously unknown historic activity (Blanton et al. 2000). Dendrochronological research identified a major period of drought corresponding to the English settlement of Jamestown (Stahle et al. 1998). A thorough reevaluation of all previously excavated materials was carried out, informing limited new excavations in New Towne (Carson et al. 2006) and a revision of understandings of urban development in the Chesapeake (Horning 1995, 2000; Carson et al. 2008).

Since 1994, Jamestown Rediscovery archaeologists have unearthed the original James Fort (1607–1624) and excavated more than a million artifacts. Over 480 ft. of palisade lines from the initial triangular fort have been exposed, as have the east and north cannon projections (bulwarks), a section of the western bulwark ditch, 11 filled-in cellars, three wells, dozens of burials, and ten structures (Kelso 2007; Kelso and Straube 2008). The range of material culture has significantly changed understandings of the character of Native and English relations in the early Chesapeake, with native wares comprising over 80% of the ceramic assemblages from the period 1607–1610. Extensive clearance deposits dumped into a series of early wells, which include personal items such as jewelry and still functional items including armor and weaponry, attest to the extreme stress experienced by inhabitants during the 1609–1610 Starving Time. The size and diversity of the archaeological assemblage from James Fort makes it one of the most significant early seventeenth-century collections of material culture relevant to European Atlantic expansion.

Historic Site and Historic Building Preservation: Overview

Daniel Schávelzon
Center for Urban Archaeology, University of Buenos Aires, Buenos Aires, Argentina

Introduction

The buildings and historic sites of Western culture are preserved according to this culture's own values or values added following arbitrary selection by each society. The theories, methods, and techniques for taking these decisions arose with the Enlightenment and have varied over time and regions. After a peak in autonomy and growth in the twentieth century, a process has now arisen to homogenize meanings and preservation methods as part of the process of globalization. In particular, toward the end of the twentieth century, criteria were unified under the *Venice Charter* of 1964 (ICOMOS 1964), based on previous agreements articulated in the *Athens Charter* of 1931 (CIAM 1931), bringing about the creation of international bodies and universal standards, albeit respecting regional variants (Page and Mason 2004). As a result, local concepts of historical value have been lost in favor of more general ones acceptable to Western tourists and heritage professionals (e.g., De Oliver 1996).

Definition

Since historic sites and buildings began to be judged to have values external to themselves or seen to have a significance that exceeded their own functionality and the society that produced them, it has been necessary to preserve them. The terms historic buildings and historic sites preservation, or more generally, "heritage conservation," refer therefore to the legal measures, practical conservation methods, and philosophies that underpin these goals and facilitate their implementation. The conceptual shift that attributed historical "value" or "significance" to elements of the built environment occurred in Western culture over the course of the seventeenth to nineteenth centuries, although other cultures began it earlier or approached it differently. These developments essentially arose in England and France and were gradually imposed with the expansion of the Industrial Revolution, the Bourgeoisie, and early Liberalism. The new ideas behind these changes were based on the Enlightenment concept regarding the past as different from the present and its potential for legitimizing the present (Lowenthal 1985), the growing body of knowledge of other cultures, and the growth of antiquarian interest in the past (Sweet 2004). Figures such as John Ruskin (1849) and Emanuel Viollet-le-Duc (1854) played a particularly important role in the construction of these new theories, which eventually spread around the world. In these early decades, the Romanticism of the nineteenth century was a fundamental factor for the aestheticizing appreciation of the legacy of the past, as William Ruskin preached.

The expansion of nationalism and the creation of the first modern nations in the USA, Latin America, and Europe gradually defined the need for special theories that permitted the construction of explanations of identity that these territories had or were supposed to have (Kohl 1998; Díaz-Andreu 2007). For this, it was necessary to have significant material elements and ensure these were accepted by all. There were two sides to this: buildings and sites had to be recognized for their historic value while at the same time the state imposed that same value on the nation as a homogenizing process (e.g., Dietler 1994). Thus arose the Cult of Heroes, the conservation of their houses or of battlefields, the erection of monuments, and preservation of important places in the foundation of the nation and the state as monuments of inestimable value that should not be

altered, maintaining them for the future. National heritage was a form of didactics, of teaching unarguable values. Constructing a nation implies defining an identity and deciding what stays and what is left out of history, what symbolizes it, and what can or must be destroyed.

Key Issues

In the twentieth century, standards were established with regard to how a historic building or place should be preserved and whether a damaged part may be replaced or not and in what way, especially after wars and other types of armed conflict. Schools, principles, and techniques of heritage conservation were created (Feilden 2003; Fisch 2008). Although the experience of Central Europe was that which had greatest impact in the world, other outstanding theories and methods were developed in the twentieth century, especially in Mexico and Japan.

By the end of the twentieth century, it became clear that every country gives different levels of importance to their heritage and to historic and archaeological sites because these historic locations are used to support and convey different identities unique to these individual countries and their political system (e.g., Trigger 1989; Kohl 1998). Cultural heritage was not seen as similarity but as difference. For some, it was used to consolidate ideologies in the light of the collapse of major political groupings; for others, it was a means to increase tourism; for still others, heritage became a way to siphon off illicit gains through the tendering of public works, or to represent elite groups, but rarely has heritage been used to represent the majority. All these issues are controversial and enmeshed within the globalizing processes of the late twentieth century. In recent years, with the development of norms established by UNESCO in the World Heritage system, preexisting theoretical concepts in each region have had to be homogenized, wiping out a large number of local differences in heritage theory and practice. This has led to a world increase in tourism to regions that are not prepared for it, causing major problems for the sites and local populations. These are cases where economic policy has prevailed over social or cultural development. It is from the creation of these policies that new theoretical positions will arise on the use and role of heritage.

Historic St. Mary's City

Regina Faden
Historic St. Mary's City, St. Mary's City, Maryland, USA

State of Current Knowledge and Current Debates

St. Mary's City, Maryland's seventeenth-century founding site and first city, is a place of deep significance to anthropology, archaeology, and history. Although none of its original buildings survive aboveground, it is an exceptionally well-preserved 800 acre archaeology site that has been investigated for over 80 years. Today, Historic St. Mary's City Commission (HSMCC) is charged with the mission "to preserve and protect the archaeological and historical record of Maryland's first colonial capital and to appropriately develop and use this historic and scenic site for the education, enjoyment, and general benefit of the public." The Commission, a state agency, operates in Historic St. Mary's City museum to fulfill its mission of preservation, research, and education.

Religious Freedom

Maryland was established at St. Mary's City by George and Cecil Calvert, the first and second Lords Baltimore. As Catholics in seventeenth-century England, the Calverts had personal experience with religious persecution. George was forced to convert to Protestantism as a child and removed from his family's home to be educated by a Protestant tutor. Educated at Trinity College, Oxford University, he eventually rose to be Secretary of State for King James I and was knighted for good service. In 1625 George announced to King James that he had become a Catholic and would resign his position. James' son Charles I granted George's son Cecil the charter for Maryland.

As settlers departed for the new colony in 1633, Cecil, now the second Lord Baltimore, cautioned the Catholics to treat the Protestants fairly to "preserve unity and peace." In Maryland, the Calverts established the policy of "liberty of conscience" and separation of church and state. While many of the leaders in early Maryland were Catholic, its policy of religious freedom attracted a diverse mixture of ethnic and religious groups living in a pluralistic society.

The Calverts' policy of the separation of church and state would eventually be translated into the City's baroque plan, discovered by archaeologists. The plan dates to approximately 1665 and is based in geometry and symmetry. The main roads of the City radiated out from a central square leading to four brick structures: the State House, jail, Catholic Chapel, and likely the Jesuit "School of the Humanities." The Catholic Chapel

Historic St. Mary's City, Fig. 1 St. Mary's City, Maryland. (Courtesy of Historic St. Mary's City)

Historic St. Mary's City, Fig. 2 Baroque Design of St. Mary's City, Maryland (ca.1665). (Courtesy of Historic St. Mary's City)

and State house were located on opposite sides of the City, reflecting their political separation. This sophisticated plan was then being utilized in Rome. The designer of St. Mary's City was likely Jerome White, an English Catholic, who had been educated in Rome and served as Maryland's surveyor general from 1661 to 1671 (Fig. 2).

At a time, when Europe was riven with religious conflict, Maryland represented a novel experiment in world history where diverse people were able to live together and prosper. Despite multiple internal and external challenges to Lord Baltimore's authority, the experiment endured for some 60 years. In 1689 rebellion linked directly to the Glorious Revolution in England led to the overthrow of the Lords Baltimore, ending the policy of religious freedom in Maryland. The government was then moved to Annapolis and the first capital abandoned. It remained a farmland for nearly three centuries.

Intersection of Cultures

St. Mary's City was a location where Maryland Indian and British people met and interacted in an exceptional way in the early phase of the Atlantic World. After acquiring half the Yeocomico village at the site, the English moved into the native houses, while the Yeocomico continued residing in the other half of the village for about half a year, thereby facilitating significant cultural exchanges. This created friendly relations with Maryland's native peoples that endured until the end of the seventeenth century. The museum tells the story of this early interaction at its recreated Woodland Indian Hamlet Site (Fig. 3).

People from Africa and of African descent came to St. Mary's City in the seventeenth century before the development of the American system of chattel slavery. Matthias de Sousa, likely of Portuguese and African descent, arrived in Maryland in 1634 as an indentured servant. After serving his indenture, de Sousa became a mariner and fur trader. While living in St. Mary's City, he served in the 1642 legislative assembly of freemen at St. John's, home of John Lewger and meeting place of the Maryland assembly. At the time, Maryland allowed all freemen, regardless of color or religion, to participate and vote in the colonial assembly. By the early eighteenth century, Maryland's laws codified slavery as a lifelong status for African Americans (Fig. 4).

Research and Discovery

Since its founding, HSMC has been an active center for research. Little was known about the first capital when in the 1930s, Dr. Henry Chandlee Forman pioneered excavations that began the discovery of the buried city. It was not until the 1960s that renewed interest of the City and the values of freedom and equality it represented led to the establishment of the Historic St. Mary's City Commission in 1966. In 1971, the Commission began a program of intense archeological and historical research. Eminent Historic Lois Green Carr was the Commission's first employee. She and her colleagues (Lorena Walsh, Russell Menard, Paul Clemens, and Alan Kulikoff) who studied early Maryland in the 1960s and 1970s became known as the Chesapeake School. Their groundbreaking work in understanding the economy and social life of the region set it apart from the dominant New England perspective of the time.

For the past 45 years, generations of historians and archaeologists have discovered evidence of the indigenous people of the area, the City's baroque plan and development of Maryland's government, its ties to the Atlantic World, the tidewater tobacco economy, and the development of slavery. HSMC has been recognized as a pioneer in public archaeology, beginning in 1972 at the St. John's site dig where student and professional archaeologists offered tours of the excavation. In January 2012, HSMC was recognized with the Award of Merit by the Society of Historical Archaeology (SHA) for over four decades of effort to preserve, protect, and interpret Maryland's "ancient and chief seat of government" as an archaeological treasure for the public (Fig. 5).

The museum's staff continues to discover the City as it trains generations of students through its annual archaeological field school, the longest running field school in the United States. Only a small fraction of the original capital, shared by the museum, Trinity Episcopal Church, and St. Mary's College of Maryland, has been excavated. While much has been learned about Maryland's first capital, there are still years of exciting exploration and discovery ahead.

Interpreting History

When visitors come to HSMC today, they see meticulously recreated seventeenth-century buildings and meet costumed interpreters at four major sites, including the Woodland Indian Hamlet, Godiah Spray Plantation, Town Center, and the *Maryland Dove*, who discuss the people and experience of living in the Maryland colony (Figs. 6 and 7).

Collections

HSMC's collections of more than six million artifacts represent multiple periods of time-various eras of prehistory, seventeenth century, eighteenth

Historic St. Mary's City, Fig. 5 Archaeological field school at Historic St. Mary's City. (Courtesy of Historic St. Mary's City)

Historic St. Mary's City, Fig. 6 Smith's Ordinary at Town Center, Historic St. Mary's City. (Courtesy of Historic St. Mary's City)

Historic St. Mary's City, Fig. 7 *Maryland Dove*. (Courtesy of Historic St. Mary's City)

century, and up to the present. It includes such material culture as fragments of stoneware, Venetian glass, metalwork, colonial and American

Historic St. Mary's City, Fig. 9 Collections at Historic St. Mary's City. (Courtesy of Historic St. Mary's City)

Indian tobacco pipes and pottery, oyster shells, glass beads, nails, and lithics.

HSMC's most unique discovery, three lead clad coffins, may be seen in situ within the foundation of the Brick Chapel of 1667 in Town Center. Originally discovered in 1990, the lead coffins were fully excavated in 1992 by a team that included archaeologists, archaeological conservators, forensic anthropologists, geophysicists, nuclear physicists, engineers, pollen analysts, and atmospheric scientists. Careful analysis and research led to the identification of the three individuals: Philip Calvert, youngest son of George Calvert; Anne Wolseley Calvert, his first wife; and a baby boy, likely from Philip's second marriage (Fig. 8).

Project Lead Coffins, as the effort became known, produced a wealth of information concerning the cultural practices of the early citizens of Maryland's first capital. HSMC staff have delivered illustrated presentations and collaborated with others to produce articles, exhibits, and films about the lead coffin project. From 2009 to 2014, the coffins were featured in the exhibit, "Written in Bone," at the Smithsonian Institution's National Museum of Natural History that attracted approximately nine million visitors (Fig. 9).

HSMC recently moved its research staff and collections to a new state-of-the-art collections storage and study facilities that it shares with its partner St. Mary's College of Maryland, a liberal arts college. The new place provides space for artifact processing, analysis, and research in the museum's library. Scholars are encouraged to use the collection for research and assist HSMC in fulfilling its mission to tell the story of Maryland's first capital.

Historical Archaeology

Vergil E. Noble
Midwest Archeological Center, U.S. Department of National Park Service, Lincoln, NE, USA

Brief Definition of the Topic

This quarterly journal is the flagship publication of the Society for Historical Archaeology (SHA) and the most widely distributed scholarly periodical pertaining to the discipline of historical archaeology. A subscription to *Historical Archaeology* is a benefit of membership in the SHA, though institutions and libraries may also subscribe. Its purpose is the dissemination of substantive and theoretical articles relevant to researchers in the field, scholars in allied disciplines, and the interested public. *Historical Archaeology* also includes published testimonials to certain SHA award recipients, transcribed interviews with prominent practitioners, and memorials that mark the passing of major figures in the field (past presidents and major award winners of the SHA as well as other major specialists

recommended to and approved by the SHA board of directors). Reviews (currently edited by Julie Schablitsky) were pulled from the printed journal in 2007 and moved to a special section of the SHA website as a space-saving measure (http://www.sha.org/publications/book_reviews.cfm). In a typical year, the journal publishes about 550 pages of content spread across four issues.

Created with the establishment of SHA in 1967, *Historical Archaeology* was then simply an annual publication. The founding editor, J. Glenn Little II, reluctantly resigned soon after his appointment, owing to illness, so the premier volume was compiled by an "emergency editor," the first SHA president, John L. Cotter. David A. Armour accepted a 3-year board appointment as editor starting with the 1968 volume, and after serving a second term, he was succeeded by John D. Combs in 1974.

Following a transitional year, Ronald J. Michael assumed full editorship of *Historical Archaeology* in 1978, a position he held through nine successive appointments until the start of 2005. Over that time, the journal expanded to a semiannual publication with two issues a year in 1981 and ultimately achieved its current status as a quarterly in 1990.

During his long and influential tenure, Michael introduced thematic journal issues (usually two each year) with guest editors and added occasional "forum" features promoting discourse among several noted authorities in response to a provocative position paper authored by one of them. A *Special Publications* series was launched, as well as topical guides to the literature, underwater archaeology proceedings from the conference, and readers compiled from reprinted journal articles (the latter now termed collectively as *Perspectives from Historical Archaeology*). Print and online indices to the journal, as well as searchable CD-ROM collections of journal volumes, also were produced. During the waning years of Michael's editorship, SHA unveiled its Internet website http://www.sha.org and began a joint publication program with the University Press of Florida. LouAnn Wurst was the first co-publications liaison in 2005, joined by Daniel G. Roberts later that year, and by Della A. Scott-Ireton in 2006. Analies Corbin became co-publications editor in 2007, a position she still holds, and under her leadership, joint publication programs were also initiated with the University of Nebraska Press and Springer Publishing.

Rebecca Allen became editor of *Historical Archaeology* in 2005 and served one term through the end of 2007. She built upon prior initiatives and supported expansion of the co-publications program. Allen also worked at defining the roles and functions of newer editorial positions, such as those responsible for joint publications and the SHA website.

J. W. (Joe) Joseph accepted appointment as journal editor in 2008, with Mary Beth Reed serving as coeditor. His editorial focus was on managing the orderly transition to electronic media, including SHA's Print-On-Demand (POD) Press. POD initiatives included the *Perspectives* series of topical readers with content selected from the journal back issues, each with an introduction to the subject matter written by the compiler.

Having been selected as SHA's president-elect, Joseph stepped down as journal editor in his third term, as did coeditor Reed, and was succeeded by Christopher N. Matthews in 2014. Matthews continues to serve as the editor of *Historical Archaeology* at this writing, maintaining the high quality established by his predecessors while working on development of new initiatives, such as the *Technical Briefs* series (currently edited by Ben Ford), which appears on the SHA website.

It should be noted that for most of SHA's history, the appointed journal editor was an officer of the society by virtue of his or her position, serving on the board of directors during his or her tenure (this was also the case with the appointed newsletter editor). A recent bylaws change, however, paired the journal editor and co-publications editor as the society's research editors, and the two incumbents run against each other at 3-year intervals for the privilege of serving as an officer of the society (similarly, the newsletter editor and website editor are paired as communications editors and stand for election to a seat on the board as an officer).

All journal back issues more than 5 years old are now available for downloading at SHA's website http://www.sha.org/publications/onlinepubs_html/, whereas more recent issues are

available to current SHA members who successfully log in to the website's members section. JSTOR archives digital back issues of *Historical Archaeology* for retrieval and downloading subject to the same "moving wall" (a fee is usually charged) http://www.jstor.org/action/showPublication?journalCode+histarch. Printed copies of many special publications and recent journal issues are also available through SHA.

Historical Archaeology in Latin America

Andrés Zarankin[1] and Melisa A. Salerno[2]
[1]Departamento de Sociologia e Antropologia, Universidade Federal de Minas Gerais, Belo Horizonte, Minas Gerais, Brazil
[2]Instituto Multidisciplinario de Historia y Ciencias Humanas, Consejo Nacional de Investigaciones Científicas y Técnicas, Buenos Aires, Argentina

Basic Information

Historical Archaeology in LatinAmerica was the only specialized publication on historical archaeology that existed in the region until 2007, when some other journals, such as *Vestígios – Revista Latinoamericanade Arqueologia Histórica*, and *Revista de Arqueología HistóricaArgentina y Latinoamericana*, began to be published. It was coordinated by Stanley South, an American scholar mostly known for his pioneering work on pattern analysis in historical archaeology. These series of publications were funded through a grant from The Conference on Historic Site Archaeology, and enjoyed the support of the South Carolina Institute of Archaeology and Anthropology. Sixteen different volumes were published between January 1994 and April 1996, and after this year, *Historical Archaeology in LatinAmerica* ceased being published.

Major Impact

The volumes show the heterogeneous development of historical archaeology in the region. Articles were mostly written by Latin American archaeologists in Spanish, Portuguese, or English and 90% of the contributions were produced by Argentinean, Uruguayan, and Brazilian scholars, showing their strong presence in this field of study. The vast majority of the contributions focused on colonial archaeology (mainly the analysis of the European settlement in the region and its consequences) with Hispanic and Portuguese settlements as the major topic. However, some scholars also discussed the nature of other kind of sites during colonial times (such as those created by maroon slaves). The study of all of these contexts involved, among other things, discussions on the production and distribution of artifacts and the construction of social differences.

In the course of its short existence, *Historical Archeology in LatinAmerica* was fundamental in the consolidation of historical archaeology in the region. The works collected in this series stress two main arguments: On the one hand, different areas and countries had been traditionally connected by similar historical processes; on the other hand, archaeologists should stop working in isolation to improve the understanding of the past and present of their own societies.

Historical Archaeology in Peru

Daniel Dante Saucedo Segami[1] and Patricia Chirinos Ogata[2]
[1]Language Education Center, Ritsumeikan University, Osaka, Japan
[2]Department of Anthropology, University of California, Santa Barbara, Santa Barbara, CA, USA

Introduction

During the last 30 years, there has been an increasing interest in historical archaeology in Peru, covering topics that range from the everyday life

of different groups to studies about changing landscapes through time. Until the 1980s, historical archaeology was not considered itself an independent field of study. Peruvian archaeologists focused mainly on prehispanic periods, leaving historical events (including the colonial, republican, and contemporaneous epochs) to anthropologists, ethnographers, and historians. Most efforts in what today would be defined as historical archaeology were oriented to support the interpretations made by historians and other specialists with data from material culture or even just treasure hunting (Hampe 1982; San Cristóbal and Guillén 1986). Globalization and postcolonial influences during the 1990s helped define historical archaeology in Peru as a field that could also help to better understand recent periods, as well as unveiling the history of groups that did not usually appear as clearly on historical records (due to biases related to race, class, and gender, among others).

Definition

Historical archaeology, as currently practiced in Peru, can be understood as "the study, using archaeological methods, of environments, moments, and processes that were also recorded contemporaneously in written documents" (Van Valkenburgh et al. 2016: 5). Thematically, this definition comes to equate the archaeological inquiry of everything that happened after the collapse of the Inca Empire due to the Spanish conquest, while expanding Deetz's (1977: 5) definition and its emphasis on the impact of European culture on indigenous peoples in the process. Methodologically, historical archaeology in Peru is essentially inter- and multidisciplinary, combining documentary and archaeological sources from a myriad of approaches.

Historical Background

The early years of historical archaeology in Peru were marked by a strong emphasis on the search for confirmation of historical accounts in the archaeological record. In particular, a lot of attention was devoted to the identification of relics and sites mentioned in Spanish chronicles, such as the search for the head of Spanish conqueror Francisco Pizarro (San Cristóbal and Guillén 1986) or the elite Inca mummies at the San Andrés Hospital in Lima (an endeavor first led by José de la Riva Agüero in 1937 as summarized by Hampe 1982 and later revisited by Bauer and Coello 2007).

Throughout the second half of the twentieth century, historical archaeology studies in Peru did not receive as much attention as in other South American countries (Van Valkenburgh et al. 2016: 8; Zarankin and Salerno 2008: 40). One of the main reasons behind this lag in interest can be traced to the professionalization of the discipline. During the 1930s and 1940s, renowned Peruvian archaeologists such as Julio C. Tello focused on proposing detailed chronologies for the development of Andean cultures, showing that it was possible to study ancient cultures without a written record. Moreover, the attempts to lead projects of construction of a national identity–particularly strong during the 1960s and 1970s–redirected the attention of the general public to a "search for precolonial splendor" (Funari 2002, cited in Zarankin and Salerno 2008: 40), deliberately leaving aside the struggles of indigenous populations across the country and the archaeological evidence of these more modern processes.

Diffusionism in historical archaeology was quite popular, particularly in the United States and parts of Europe up until the 1950s. Following this approach, archaeologists would be able to clearly define the affiliation of each object and site, using categories such as "native" and "foreign" (for a critique, see Silliman 2009). Zarankin and Salerno (2008: 40) suggest that one of the main characteristics of a diffusionist approach to archaeology was to present very detailed site reports and descriptions of artifacts, with the purpose of inserting archaeological sites within defined culture-history sequences. Historical archaeology – as practiced by Peruvian archaeologists – largely fitted into this trend at least until the mid-1970s (Arrieta et al. 1975;

Cárdenas 1970; Cogorno 1970). It is worth noticing that studies that favored cultural-historic interpretations became popular in Peru several years or even decades after they were in vogue in other regions. Furthermore, while a processual approach started to influence Peruvian archaeology during the 1950s and 1960s, this influence was not extended to historical archaeology in Peru until much later.

One of the main topics of these early research endeavors focused on the study of Spanish colonialism (Van Buren 2010) and particularly the investigation of historic sites and the founding of cities (Mogrovejo 1996). Unfortunately, most of the resulting data were presented only in "gray literature," reports submitted to the National Institute of Culture (former INC, now Ministry of Culture; Van Valkenburgh et al. 2016: 8; Mogrovejo 1996: 12). A point of departure occurred in the 1980s, as the field of historical archaeology in Peru focused on three main themes: (1) trade and economy during the colonial period; (2) technology, including metallurgy and pottery; and (3) religion, predominantly related to the syncretism between native and Catholic traditions.

In terms of the trade networks and the economy of the colonial period, one of the most important contributions to the field of historical archaeology during the late 1980s was the Moquegua-Bodegas Project, which focused on the Spanish wineries in the southern Moquegua valley. As part of this project, the research team excavated wine cellars, kilns, and other structures dating to the Spanish colonial period (Rice and Smith 1989; Rice 2012) to investigate the organization of wine and brandy production in hacienda sites. This production was predominantly structured to cover the demand for liquor at the mining center of Potosí in central Bolivia (Van Buren 2010: 174).

Research at Porco, a small mining center near Potosí, was key to expand the scope of historical archaeology in Peru to the topic of technology, in particular mining infrastructure (Van Buren 2010, 2016). In particular, this project offered the opportunity to examine the use of both native and colonial traditions related to mining and to compare repertoires across continents. Similarly, this period saw an increase in pottery studies, especially those centered on the reexamination of local and imported wares during the colonial period. However, although classifications of Spanish majolica and imported wares were conducted and made available in other South American countries (Therrien et al. 2002), only limited attempts to achieve such characterizations and comparisons were made in Peru until recently (Kelloway et al. 2018).

Finally, during the 1990s, there was a renewed interest in the study of syncretism between the Catholic and native religious traditions, in both burial rituals and their associated artifacts. In more recent years, this approach has been further explored (Murphy and Boza Cuadros 2016), especially with the excavation of churches associated with *reducciones* (Klaus and Tam 2009; Klaus 2016) and the consideration of a more substantial interpretative framework that includes evidence for violent and nonviolent native resistance, as well as other strategies (Murphy et al. 2010).

Key Issues/Current Debates

Over the last 20 years, historical archaeology in Peru has grown quite significantly as a discipline. What started as a series of isolated findings and an emphasis on description has now evolved into several long-term research programs, including the construction of museums (e.g., the Bodega and Cuadra Museum in downtown Lima; Fhon 2012, 2016). Researchers from Peru itself, the United States, and Japan are developing projects focused on historical archaeology, and several universities have become strongly associated with this field (e.g., Vanderbilt, Chicago, and Brown, among others). As it usually occurs due to multiple factors, including differences in availability of information among areas, certain regions have concentrated efforts (e.g., Arequipa, Cusco, Lima, and Lambayeque; Mogrovejo 1996: 13–22), while others remain practically unexplored (e.g., Cajamarca).

This new impetus behind the practice of historical archaeology has been favored not only

by changes in theoretical paradigms and the development of new technologies but also by political and social changes in Peru over the last couple of decades. In contrast with the univocal representation of the Peruvian "grandiose past" focused on the Inca empire and promoted by the military government during the 1970s (Rice 2012), now there is definitely more room for a multivocal interpretation of the events corresponding to the more recent past that includes the prehispanic, colonial, and republican periods (although there are sporadic instances of historical negationism, especially among political figures).

As a discipline, historical archaeology in Peru has also moved past the debate about the predominance of either the documentary sources or the archaeological sources, which is in itself an extension of the apparent tension between history and archaeology (Mogrovejo 1996). Its practitioners are less concerned with terminology (and the distinction between prehistory and history) and more focused on research questions and programs. There does not seem to be a unity of theoretical approaches or a uniquely Andean – much less Peruvian – brand of historical archaeology (Jamieson 2005), and there seems to be no apparent reason to do so. On the contrary, the field has benefitted from a diversity of academic traditions, topics, and methods.

Current Topics

Due to its particular sequence of development, historical archaeology in Peru has traditionally kept a close bond with ethnohistory (Murra 1975; Pease 1978; Rostworowski 1978), and this relationship translated into an emphasis on the study of the early colonial period. In particular, a topic that has received wide attention is the series of events related to the Spanish conquest of Peru, as part of the processes of European colonialism during the sixteenth century (Van Buren 2010). Interestingly enough, the place where such colonial encounter occurred – the city of Cajamarca and its surroundings – has not been subject of extensive archaeological and historical research for the period in question (with the exception of those sites intervened by the INC and published only through technical reports as well as a few interventions on urban landmarks; Sarmiento and Saldaña 2016), probably due to its fast urban growth, as well as other factors. On the contrary, what it is assumed to be the last bastion of the Incas – the Vilcabamba region – has been thoroughly studied in recent years (Bauer et al. 2015).

The use of more recent theoretical models to interpret culture contact and colonialism in the Andes allowed for a shift away from acculturation models toward an emphasis on dynamic power relations, the intersection of multiple cultural identities, and the transformations resulting from those interactions while acknowledging the asymmetrical relations of power in which these societies are immersed (Silliman 2009; Wernke 2013). Colonial institutions are being reexamined, and, among them, the *reducciones* (colonial settlements where the native population was relocated) have been receiving particular attention, given their position as links between communities, structures, and landscapes (Saito and Rosas Lauro 2017; Wernke 2013).

The Toledan *reducciones*, colonial doctrinas, and Jesuit missions all were part of a "civilizing" project imposed on the local indigenous population. These institutions implied the forced resettlement of communities to easily accessible areas not only for administrative and practical purposes but also to create *civitas*, an ideal of community based on order and decency (Cummins 2002). The archaeology of *reducciones* is particularly enlightening because while the documentary sources – mostly official guidelines to implement the accompanying sets of policies – outline the normative aspect of this institution, the archaeological study of these settlements has successfully shown how these guidelines translated into actual practices (Saito and Rosas Lauro 2017). Some of the better-documented *reducciones* include Chérrepe in the Zaña valley (Van Valkenburgh 2016), as well as Mawchu Llacta (the old reducción of Santa Cruz de Tuti) and the catholic doctrina at Malata, both in the Colca valley (Traslaviña 2016; Wernke 2016).

The evangelization and social engineering projects from the colonial era also brought along profound changes in the economic structures of the indigenous communities, including the reorganization of local economies toward imposed Spanish cultural practices like the production of wine and brandy. Continuing with her studies on the development of these industries during the sixteenth century and later in Moquegua, Prudence Rice (2012) has updated the results of her fieldwork between 1985 and 1990 and revisited them in her more recent synthesis with links to theoretical approaches that emerged in the last two decades, including the archaeology of capitalism, actor-network theory, world-system theory, and frontier theory.

Likewise, the Jesuit missions established mostly along the Peruvian coast also constituted dynamic actors in the economic landscape of the colonial era. Furthermore, considering that enslaved Africans comprised a significant part of their workforce, these settlements added layers of complexity to the social and cultural relationships of their time. Weaver (2016) offers a comprehensive archaeological and historical examination of the Jesuit wine haciendas of San Joseph and San Xavier in Nasca. His research sheds light on the coercive structures of *hacienda* labor, which pervaded both public and public spheres, as well as some of the ways enslaved Africans expressed their own agency, establishing a parallel economy and adding their own motifs to the *botijas* produced. The contextualization of hybrid material culture with historical documents allows us to document a diversity of experiences within the African diaspora in Peru (Maas 2018; Santa Cruz Alcalá 2019).

Finally, related to the study of diaspora and migration processes in Peru but in more recent times, several tombs corresponding to Chinese *coolíes* have been reported along the Peruvian coast (as the examples compiled by Chuhue et al. 2012 in the San Lorenzo Island and haciendas in Huaral, Lima and Cañete. A more recent case was found in Huaca Bellavista in Lima; Gomez 2015). Although mostly presented as isolated findings, and considering it is highly likely that these contexts continue to appear given that site reuse is quite typical in the Andes, one of the goals of future studies should be to incorporate this evidence into archaeological projects and long-term research programs. This type of projects would not only contribute to the still largely unexplored study of the Asian diaspora in Peru, but it would also give impulse to the archaeological study of the republican era, notoriously missing from research so far.

New Methods

In addition to renewed sets of topics, one of the most important contributions historical archaeology in Peru has brought to the table during the last 20 years is an emphasis on the design of interdisciplinary projects – combining archaeology, architecture, and history – and, with that, a wide range of methods. Beyond archives and trenches, whole new analytical toolkits – heavily favored by the development of new technologies – are now available for researchers across the country.

One of the most promising tools is the use of geographic information systems (GIS) to explore the spatial relationships between settlements and landscape and to outline the intricacies of, for example, major episodes of culture contact (Wernke 2013; Boza Cuadros 2018). Wernke (2013) and his team have used viewshed analysis, least-cost path models, and "reverse site-catchment" to study the entanglements and negotiations between the influential Collagua communities of the Colca valley and the Inca and Spanish groups trying to exert control over their territory (Wernke 2013: 252). Combining GIS with documentary and ethnographic sources, Wernke has moved past the dichotomy of "colonizer and colonized" frequently found in culture contact studies a few decades ago and has taken a step toward a much-needed multiscalar approach. The use of GIS has also helped to reconstruct landscapes and adaptation strategies on different periods, especially on the distribution of canals in valleys that are being used until now. A good example is the interdisciplinary work of Chacaltana and Cogorno (2018) about the Rimac valley in Lima, based on historical data of canal administration during colonial times to virtually

reconstruct the distribution of canals during prehispanic periods. This work has also been helpful to recognize canals that are used in modern times but were hidden by the urban expansion of Lima.

Also allowing a nuanced characterization of colonial encounters (Quilter 2010, 2016), bioarchaeological studies have contributed to expand our knowledge of the everyday life and struggles of indigenous populations during the colonial era (Klaus 2016; Klaus and Tam 2009). Klaus (2016) investigated the Muchik town of Mórrope, where a catholic church was built in 1536, and documented a wide set of variables associated with health and stress, including degenerative joint disease, ante-mortem tooth loss, enamel hypoplasia, and dental caries, combined with funerary data that showed hybrid – Spanish and Muchik – burial rituals (e.g., orientation along the Muchik traditional axis, use of cinnabar, and evidence of partial exhumation and manipulation of the human remains). These data show conditions of increased stress for the local communities, as well as processes of resistance and the construction of a new Muchik identity in response to the changing political and social conditions.

Bioarchaeological data also allows exploring the diversity of strategies local individuals and communities put in practice to deal with the sudden changes in their living conditions (the "archaeology of resistance"). To investigate this issue, Murphy and colleagues (Murphy et al. 2010; Murphy and Boza Cuadros 2016) focused on the burials at the Puruchuco-Huaquerones site in the Rimac valley, where they documented evidence of outright defiance and violence, as well as removal of the body and secondary interment as sign of resistance. In the first case, atypical individuals with injuries probably caused by Spanish or European weapons were interred without funerary graves and with a different orientation; within the context of the Spanish siege of Lima, some local communities allied with the Spaniards, but some others refused and suffered violent retribution. In the second case, the individual was removed from a church burial that disrupted the Late Horizon tradition of interring the dead in their ancestors land. Fine-grained bioarchaeology analysis can therefore provide valuable clues to reconstruct different types of interaction and diverse experiences in the context of a colonial encounter, including resistance (violent and nonviolent), accommodation, persistence, and complicity, put into practice by all the social actors involved.

International Perspectives

The development of historical archaeology in Peru did not occur in a vacuum. The field has received influences from the United States as well as other South American countries; however, its evolution shows both similarities and differences with these regions in terms of theoretical approaches and research subjects.

A relatively recent trend in Peruvian historical archaeology that had its antecedents in South America is the integrative approach between archaeology and heritage studies in urban contexts (Schavelzon 2003). While the archaeology of historical urban centers is not new (Mogrovejo 1996), there seems to be an increasing acknowledgment to consider the colonial, republican, and contemporary times as part of the "life-history" of many archaeological sites (Álvarez-Calderón 2016). In addition, this recognition of an extended cultural biography includes coming to terms with episodes of conflictive – or even negative – history.

In addition, as explained by Van Valkerburgh and colleagues (2016: 10–11), an important difference between South America (including Peru) and the rest of the world in the theorization of historical archaeology is a higher fluidity in the transition between the pre- and post-conquest periods. These stages are conceptualized as part of a continuum, which helps archaeologists to widen their interpretative frameworks along a diachronic axis; the concept of "transconquest" (Wernke 2007; Van Valkenburgh 2019) exemplifies how the archaeological analysis of larger social processes – including comparing colonial encounters – benefits from such an expansion. However, it is worth noticing that the comparison of colonial processes and strategies requires

the use of shared analytical categories (e.g., empires and colonies, among others) that make the contrast possible in the first place, leaving aside – at least partially – a more particularistic approach that emphasizes the unique qualities of "lo andino."

On the other hand, there has been a direct influence of US academic and intellectual traditions in the practice of historical archaeology in Peru since at least the 1950s, and this impact has been particularly noticeable during the last couple of decades, in terms of both theoretical approaches and research themes. An example of approach currently explored in US historical archaeology that is expected to gain traction in Peru is the need for a multiscalar approach and specifically of a "glocal" scale of analysis (Roudometof 2016), navigating between local, regional, and global levels. On a similar note, the study of haciendas (Weaver 2016) and the African diaspora in Peru has benefitted from the development of the archaeology of slavery and plantations in the United States, both theoretically and methodologically.

However, there are also significant differences between the practice of historical archaeology in Peru and the United States. For example, while many research projects use a glocal scale, the topic has not been adequately discussed in Peru in terms of theory and its utility. In addition, there still seems to be a reticence among historical archaeologists in Peru to investigate events of a more recent past; in general, there is a preference for studies focused on restoration of archaeological sites for tourism and not for systematic archaeological research. Other current topics and approaches in the United States, including the development of Industrial Archaeology, the Archaeology of the Asian Diaspora, and Subaquatic Archaeology, are still in the initial stages of growth in Peru.

Future Directions

There is a renewed interest in the practice of historical archaeology in Peru, as indicated by the publication of the proceedings of the International Symposium of Historical Archaeology (Traslaviña et al. 2016a, b), the recent special issue of the *International Journal of Historical Archaeology* (Kennedy and Norman 2019), and the now frequent symposia around this theme in the National Archaeology Congress (Santa Cruz Alcalá 2019; Vega Centeno 2018, among others). In particular, considering that the National Congress showcases the archaeological projects conducted each year, such increase in the number of historical archaeology papers correlates to a higher number of research projects dedicated to the discipline. Most of these projects are the result of international collaboration and have different degrees of success in community relations.

However, while historical archaeology has managed to make remarkable progress in its relatively short history in Peru, the list of prospective challenges – including continuing efforts as well as new initiatives – remains quite extensive. First, given the particular nature of historical archaeology, future projects must keep embracing interdisciplinarity from their inception. This approach has benefitted from the use of new technologies, like GIS (Boza Cuadros 2018; Wernke 2013), and it should encourage research teams to be creative and approach previously unexplored sets of material culture as well as to revisit old sets (e.g., *khipus*; Medrano and Urton 2018).

Additionally, several themes currently explored actively in other regions (i.e., North America and Europe) such as labor (Phillippi 2018) and migration have received only limited attention so far in Peru (but see Smith and Boza Cuadros 2019). This is particularly the case for the analysis of labor relations and migration processes among those communities historically underrepresented in the archaeological record (e.g., the African and Asian diasporas; Arrelucea 2018). In the United States, both Voss et al. (2018) and Ross (2013) have recently used multiscalar approaches to navigate between institutions, production processes, and people, while De León (2012) has carefully examined the materiality of modern migrant communities. These topics offer promising perspectives to expand the scope of historical archaeology in Peru in future years.

A related challenge arises from the potential that historical archaeology holds to reconstruct

a multivocal past – as opposed to the univocal "official history." In some cases, the historic-archaeological record allows to identify fine-grain differences (e.g., by class, gender, and race, among many others) and diverse experiences among the "indigenous" groups that might have been previously described as monolithic blocks (Zuloaga 2012 for the case of Conquest-era *curacas*; Chacaltana 2016 for the case of women in Colonial tambos). In others, it can shed light on the quotidian life of groups apparently well represented in the documentary record (e.g., Japanese immigrant workers in Coastal haciendas; Chirinos and Saucedo 2020). Material culture, in such occasions, can nuance and contextualize individual and social memories as well as their change over time.

Finally, the development of historical archaeology in Peru has the potential to connect people to their surrounding archaeological sites in new ways. By covering a wide range of contexts and materials – inherent to its *raison d'être* – historical archaeology has the potential to show that archaeological sites can appear in many shapes and forms, including (but not limited to) mines, harbors, and even old wineries (Mogrovejo 1996; Rice 2012). It can also provide a different perspective on a wide range of more recent events, including independence battles (i.e., an archaeology of battlefields), rural-to-urban migrations, and the development of urban centers.

Historical Archaeology in the Iberian Peninsula

Tânia Manuel Casimiro
Departamento de História Faculdade de Ciências Sociais e Humanas, Instituto de Arqueologia e Paleociências da Universidade Nova de Lisboa, Lisbon, Portugal

Introduction

What is the intention behind talking about Portuguese and Spanish historical archaeology coextensively? Were these countries identical to such an extent that their archaeology should be jointly interpreted? Or are their respective ontological perspectives and disciplinary concerns so distinct that two different papers should be written? When taking into account the developments in historical archaeology over the last 30 years, both countries have faced similar challenges and disciplinary trajectories. Their geographical, political, and cultural proximity created comparable conditions and experiences during the Early Modern period, making a joint approach the most sensible. For example, their politics and economies during this period were intertwined in various ways: several marriages took place between their respective

Historical Archaeology in the Iberian Peninsula, Fig. 1 Map of the Iberian Peninsula with the places mentioned in the text

noble families; proximal ports traded constantly with each other; and even one king ruled both territories for 60 years (1580–1640). In addition, there is considerable evidence of people travelling between the two countries and settling in either during the Early Modern period (Fig. 1). This closeness (which may also be traced back to previous periods) should not be ignored in the context of historical archaeology, as both countries share the same thematic basis in the field (Azkarate and Escribano-Ruiz 2014: 88). If a combined perspective seems superfluous when talking about local contexts, it is integral when a more general or international approach is undertaken.

Defining Historical/Early Modern Archaeology

The general designation of "historical archaeology" in countries such as the United States, Australia, or Brazil, among others, is usually associated with archaeological material and deposits from the late fifteenth century (European arrival in the Americas) to the nineteenth or even the twentieth century, a timeframe generally accepted in publications and congresses of historical archaeology (Deetz 1977: 5; Montón Subias and Abejez 2015: 14; Mehler in press). In Portugal and Spain, the designation of historical archaeology is seldom used, the most widespread terms being *Arqueologia Moderna* or *Arqueologia Pós-Medieval*, since historical archaeology has a broader sense if understood as the archaeology of a time containing written records (Montón Subias and Anejez 2015: 13).

In Spain, historical archaeology begins in 1492, the iconic date marking the end of the Middle Ages in the conquest of the Muslim Emirate of Granada and Columbus' arrival in the Antilles. In Portugal, the defining date marking the division between medieval and Early Modern periods is more complicated, since it is assumed that the discoveries (beginning with the conquest of Ceuta in 1415) represent a major turning point. A recent exhibition about this event clearly presented Portugal as no longer a medieval country (Teixeira et al. 2015a). However, no visible changes are perceptible in the archaeological record prior to the late fifteenth century (Gomes 2012). In this sense, both countries assume

Arqueologia Moderna to have started around the same time.

If we take the late fifteenth/early sixteenth century to be the starting point for the Early Modern period, the end is more easily defined. In Portugal, the iconic date of 1 November 1755, when almost the entire country was affected by a major earthquake, conventionally marks the end of the Early Modern period. Although no one assumes that late eighteenth century is associated with the contemporary period, archaeological studies of the Early Modern period tend to stop around this time (Gomes 2012). In central and southern Portugal, the earthquake debris is frequently found in the archaeological record, and in archaeological practice, it seems that only things from below this layer are considered worth preserving or excavating properly. In Spain, though no specific date is noted by scholars, the end of the Early Modern period is more debatable. In some areas of the country, nineteenth- and twentieth-century contexts are constantly overlooked by archaeological investigation, with the French Revolution (1789) often used as the cutoff point. However, in other areas, contemporary archaeology is almost assumed to be a branch of historical archaeology (Escribano-Ruiz 2017: 517).

Recently, contemporary archaeology, which some scholars consider to be archaeology of the twentieth century, has developed into a research field in Spain through studies of the Civil War. In Portugal also, projects are currently being developed in relation to twentieth-century material culture (González-Ruibal 2010; Casimiro and Sequeira 2019). In Spain, twentieth-century archaeological contexts are excavated and recorded even in commercial archaeology, at least in urban centers (Escribano-Ruiz 2017: 516), while in Portugal, twentieth-century context and artifact recovery is still rare and, when done so, rarely studied. However, if some countries categorize contemporary archaeology as part of a broader historical archaeology – a subject currently being debated in Spain (Mehler in press) – in Portugal the theoretical framework in which nineteenth- and twentieth-century archaeology is developing differs completely from that of the Early Modern period (i.e., sixteenth to eighteenth centuries).

An exception to the general lack of interest in nineteenth-century archaeology in both countries has been industrial archaeology, which has assumed a leading role in archaeological studies of the period. This has led some authors in Portugal as well as Spain to suggest that all archaeology dating to nineteenth-century contexts is intrinsically industrial and that the labels of historical or contemporary archaeology cannot be assigned to these contexts and materials (Cerdà 2008: 72; Custódio 2015: 93).

Aside from this debate, it is generally agreed that historical archaeology in the Iberian Peninsula corresponds to the period from mid to late fifteenth/early sixteenth century till the late nineteenth century. Accordingly, this will be the chronological focus of this paper.

In both countries, historical archaeology findings are protected by archaeological and heritage laws, since protection is generalized to all archaeological finds regardless of their chronology (Portuguese Law 107/2001, 8 September, and Spanish Law 16/1985, 25 July). While in Portugal this law is applied to the entire country, in Spain, due to its administrative division, specific regional laws affect the treatment of archaeological material accordingly.

Underwater archaeology is intentionally omitted from this discussion, even though the global navigation undertaken by Portugal and Spain in the Early Modern period left unquestionable influence on their organization and economy, and resulted in the development of important port cities. However, this is in fact an important aspect of Iberian historical archaeology and where archaeologists from the two countries can work together, especially since Early Modern shipbuilding is assumed to be a shared Iberian tradition (Alves 2001) by underwater archaeologists. The number of joint projects and archaeological evidence in this area is too extensive to be mentioned here, although a few have shared links in both countries, such as the *Forest Resources for Iberian Empires: Ecology and Globalization in the Age of Discovery* project, and several

conferences in which researchers of both countries have presented joint work.

Key Issues, Current Debates, Future Directions, and Examples

A few attempts to draw a general overview of historical archaeology in Portugal and in Spain have been written, and they present important information about the discipline, especially in terms of site and artifact catalogues (Represa 1996; Amores 1997; Gomes 2012; Gomes and Casimiro 2013a; Montón- Subias and Abejez 2015; Escribano-Ruiz 2017). This paper is, nevertheless, the first to attempt a combined debate that will hopefully promote reflection not about the differences in Portuguese and Spanish Early Modern archaeology, which have been often enumerated, but the similarities. A list of every site where Early Modern archaeological finds have been found is not an objective of this paper, since this would entail describing hundreds if not thousands of sites in both countries. This also applies to the study and publication of the archaeological materials. This will only be referred to when contributing to an international overview of historical archaeology in both countries and how it can contribute to Iberian archaeology holistically.

Development in the interest of Early Modern archaeology in Portugal and Spain can be traced back to the 1980s, although it took a few decades for it to be recognized as a discipline (Amores 1997; Gomes 2012). This was generally brought about by the increase in excavation and recording of urban contexts. Cities such as Lisbon, Silves, Coimbra, and Porto (Portugal) and Seville, Madrid, Toledo, and Barcelona (Spain), among many others, were central to this development. From the 1980s onwards, the number of publications has also multiplied. While "Spanish research on the post-medieval period is more widely disseminated on a global scale than one a local one" (Escribano-Ruiz 2017: 517), the same cannot be said about Portuguese research, which is still oriented more towards a national audience. In spite of the frequent participation of Portuguese archaeologists in international conferences, the publication of papers in English-language journals seldom occurs. Indeed, both countries have come short in making their work widely available. Even if published in Portuguese or Spanish, most papers about sixteenth- to eighteenth-century archaeology are difficult to access (even when there are no publisher access limits), and only a small number of researchers make their papers available on online platforms.

At this point, it is necessary to talk about three different realities responsible for the development of historical archaeology in both countries. Firstly, the necessity of recording and keeping all archaeological material (due to the Valletta Convention) made archaeological companies the primary custodians of it, though most archaeologists are not trained as historical archaeology experts. This has resulted in an enormous number of records and archaeological stores filled with unstudied artifacts. Save for a few exceptions, the majority of these sites were never investigated or properly published. Secondly, there has been a turn in research at some universities where PhD students have started to dedicate their theses to material and theoretical debates focusing on Early Modern archaeology. The third reality is related to archaeologists working for municipalities or museums who have conducted excavations of this period. Except for a few isolated cases, universities, municipalities, and archaeological companies rarely work together in research projects. More frequently, archaeology students conduct some of their academic work using material excavated by archaeological companies or museums which is eventually published in journals or conference proceedings.

As for Early Modern research topics, they are quite similar in both Portugal and Spain. There is a strong interest in studying major buildings – primarily convents, fortresses, and castles (some being medieval in origin but still active in the following centuries); military archaeology; or material culture studies (i.e., ceramics; see discussion below) (Figs. 2 and 3). While ceramic studies were initially grounded culture-historical

Historical Archaeology in the Iberian Peninsula, Fig. 2 El Born Market – Barcelona

Historical Archaeology in the Iberian Peninsula, Fig. 3 Eighteenth-century house – Lisbon

approaches in the 1980s, following more recent contact with post-processualist archaeology, scholars have made use of new theoretical methods and subjects such as identity, inequality, and gender, among other themes, evolving from the initial empirical observations (Casimiro et al. 2019a; Escribano-Ruiz 2019). Consequently, Iberian archaeologists are currently more interested in "developing thematic archaeologies which are not fragmented by time restrictions analysing societies in their socio-economic-cultural changes overtime" (Azkarate and Escribano 2014: 220).

Material culture in general and ceramic studies in particular are among the most widespread areas of study in historical archaeology, owing to the abundance of material but also due to the fact that Iberian ceramics were exported in large quantities, not only to the former Iberian colonies from the Atlantic to the Pacific but to trade partners, especially in northern Europe, making them an important vector for understanding globalization (Barrachina and Escribano Ruiz 2012; Casimiro 2018). While international scholars have studied ceramics in former Spanish and Portuguese settlements in the New World for some time (Deagan 1987; Albuquerque 2008), it would take a few decades for Iberian archaeologists to recognize their importance and develop general studies which reflect their worldwide expansion (Gomes and Casimiro 2013b; Buxeda i Garrigós et al. 2015a; Casimiro and Newstead 2019). In this field, archaeometry has played an important role since a large portion of research projects undertook provenance studies to understand what was being made in the Iberian Peninsula and later exported around the world. Five key research projects have dealt with this material. In Spain, the *Tecnolonial*, *ArchSymb*, and *CERANOR* projects sought to understand the technological changes of Spanish and Indigenous ceramics and the transmission of technical knowledge from colonizer to colonized populations, especially for tin-glazed wares (Buxeda i Garrigós et al. 2015b). As for Portugal, the two main projects investigating the international distribution of ceramics have been *Portuguese Faience in the World (16th–18th centuries)* (Gomes and Casimiro 2013a) and *Portuguese Red Wares in the North Atlantic Trade* (Casimiro and Newstead 2019). While the projects developed in Spain had a major focus on production and impact in colonial territories, Portuguese projects focused on production distinction (also involving archaeometric studies) although with a more international perspective, examining distribution both in colonial territories and between trade partners.

In spite of the ceramic distribution research foci in both countries, Spanish ceramics were the first to be recognized internationally through study and publication in countries such as the United States – especially in Florida (Lister and Lister 1974) – the United Kingdom, and Ireland (Gerrard et al. 1995), while study of Portuguese ceramics outside the country has only recently begun to gain ground. In fact, most Portuguese ceramics, especially faience, have been mistaken for Spanish, Italian, or Dutch varieties when encountered archaeologically in other countries. The reason behind this is not only the lack of knowledge about Portuguese ceramics – for papers about ceramics were only published in Portuguese – but the fact that both Portugal and Spain were producing similar wares (Fig. 4) impossible to distinguish without archaeometric analysis. From white, plain, tin-glazed bowls and plates to *botijas* (olive jars) used to transport commodities in ships, both countries used and exported very similar vessels (Fig. 5).

Aside from ceramics, other disciplines have seen increased application in historical archaeology. In the last decade, bioarchaeological studies of cemeteries have traced a portrait of post-medieval populations in several parts of the Iberian Peninsula. The same can be said for zooarchaeological studies, which are attracting academic attention in both countries, though the theoretical framework continues to be a focus on the economic and alimentary importance of animals.

Although both countries were heavily involved in Atlantic and worldwide expansion, seen in the occupation of several territories, the discussion of colonial encounters is still very recent and not very proportional. In Spain, archaeology has engaged with this theme consistently, especially in the Canary Islands, where Spanish colonial

Historical Archaeology in the Iberian Peninsula, Fig. 4 Tin-glazed ware bowls. Spanish on the left and Portuguese on the right

Historical Archaeology in the Iberian Peninsula, Fig. 5 Olive jars. Portuguese product on the left and Spanish on the right (after Silva 2018)

occupation left quite a significant impact (Montón-Subias 2015; Montón-Subias et al. 2016). In Portugal, few publications have dealt with this subject (Coelho 2018; Casimiro et al. 2019b).

However, colonization is one of the main research areas where we see Spanish and Portuguese archaeologists working together. At the Society for Historical Archaeology conference in Leicester in 2013, a session was organized by André Teixeira and Javier Iñañez with the title *Territory, settlement and material culture in the Iberian colonial empires (16th–18th centuries)*. Just a year later, a group of young researchers – Joana Torres, Miguel Busto Zapico, Regis Barbosa, and Sergio Escribano Ruiz – organized

a session in the JIA Conference (Young Researchers in Archaeology) entitled *Towards Archaeology of Colonization: Living in Between Continents in the Early Modern Period*. In 2018, in the Barcelona European Archaeologists Association annual meeting, Javier Iñañez and André Teixeira once again organized a session named *Archaeology of Material Culture and Territory within the Iberian colonial empires (15th–18th centuries*). Despite the great interest and discussion generated in these respective sessions, there have been no published proceedings discussing similarities or differences in Iberian colonialist initiatives from an archaeological perspective. The colonial and postcolonial debates promoted by these conference sessions are still very much focused on material culture and less on the political, cultural, and social implications of colonialism (then and now) or even decolonization, a subject that is seeing debate in Spain (Montón-Subias et al. 2016).

In 2015, Paulo Funari and Maria Ximena Senatore edited a book entitled *Archaeology of Culture Contact and Colonialism in Spanish and Portuguese America*, which shows the disparate treatment of the topic by Spanish and Portuguese scholars. Of the book's 17 chapters (not counting the introduction and conclusion), only 4 are dedicated to Portuguese colonialism, and Portuguese archaeologists only participated with 1 paper, focusing on the trade and exchange of objects, plants, animals, and people (Teixeira et al. 2015b).

Several research projects and workshops are currently being undertaken investigating Early Modern trade and colonialism. In Spring 2020, a 1-day seminar organized by Teresa Canepa and the author will be held in London, entitled *Chinese porcelain in the Iberian Peninsula, 16th–18th centuries: an archaeological perspective on trade and consumption*, which intends to debate the similarities and differences between Spanish and Portuguese consumption of this global product. The European-funded project entitled *The construction of early modern global Cities and oceanic networks in the Atlantic: An approach* via *Ocean's Cultural Heritage (CONCHA)* is currently developing research agendas with multiple partners in Portugal, Spain, Ireland, France, Cape Verde, São Tomé and Principe, Colombia, Brazil, and the United States. One of its objectives is to understand "the rise of global capitalism in its early form ("colonial mercantilism"), by using coastal and underwater archaeological context analyses." Although a few workshops and conference sessions have been held, no publications have appeared yet, although this project will probably set a new benchmark for Iberian and Atlantic collaborations. No information on the project website mentions whether any attention will be given to the Atlantic cities in the Iberia Peninsula or solely in the colonized countries.

In terms of fieldwork, Spanish archaeologists have worked extensively in South America (e.g., Argentina and Chile) and even in the Basque fisheries of Newfoundland, while Portuguese archaeologists have conducted much research in Northern Africa (Ksar es-Seghir, Ceuta, El Jadida – Mazagan), where colonialism did not gain the ethical implications it has in southern African or Brazilian territories. Only recently have Portuguese archaeologists started to work in countries such as Cape Verde, which has not allowed time for publication of results. It must be noted that archaeology in Portugal itself, and in Spain as well, has largely ignored the study of slavery, which has recently started to emerge (Casimiro et al. 2019b). A combined Iberian perspective on Atlantic colonialism would be a fruitful research avenue, especially one that takes into account how similar cultural backgrounds may have influenced the type of occupation undertaken and how both countries reacted to the abolition of slavery and colonialism from an archaeological point of view. It would be interesting to extend this discussion beyond the eighteenth century and apply it to subjects such as the abolition of slavery in the Iberian empires, the loss of the African colonies in the twentieth century, and general processes of decolonization. Archaeology can provide fundamental contributions to these discussions.

As can be seen, although numerous studies have been conducted in Iberia, historical archaeology is still largely confined to site reports and the study/curation of specific collections. Broader

debates about major themes are still largely absent from archaeological publications and conferences in both countries. On the other hand, we should not ignore that both countries have in fact regional differences, and while in Portugal the focal point of research and fieldwork is Lisbon, in Spain, the Basque Country, Andalusia, and Catalonia are the primary research areas for historical archaeology (Bengoetxea Rementeria 2004; Barrachina and Escribano-Ruiz 2012). PhD researchers in both countries tend to pursue more holistic/general approaches and remove the major focus from these areas.

In terms of tertiary education, postmedieval archaeology, excluding industrial archaeology, is only taught in two universities in Portugal, and the number of academic university staff with the pertinent expertise is quite small. Although Sergio Escribano mentions that "it is not uncommon to find degree courses at Spanish universities which include post-medieval archaeology" (Escribano-Ruiz 2017: 516), a recent survey (Mehler in press) refers to only three such permanent positions in Spanish universities (Granada, Seville, and the Basque Country), suggesting that the teaching of courses may be in the hands of nonpermanent staff. In Portugal, the number is higher – six between Lisbon, Coimbra, and Porto. However, in both countries the number, especially in Spain, is low, also taking into account the number of universities that offer degrees in archaeology. Nevertheless, the number of PhD students and postdoctoral researchers working on post-medieval topics is increasing in both countries. While no formal survey has been made, research papers by postmedieval Iberian researchers have increased in the last two decades.

In terms of publication, there is no specific platform for publishing historical archaeology work in either country, and postmedieval papers appear frequently in general archaeology journals. In Portugal there are only about a dozen archaeological journals, and historical archaeology papers are published predominantly in *Almadan* and *O Arqueólogo Português*. In Spain, archaeological publication is much more widespread across some 70 journals (Armada 2017). Historical archaeology papers appear occasionally in journals such as *Complutum*, *Archeogazte*, *Acta Historica et archaeological mediaevalia*, or *Territorio y Arqueología*.

Conclusion

Due to its history, the Iberian Peninsula is very much a multicultural world. The Muslim domination until the late fifteenth century culturally connected a large portion of the population of this vast territory with people from northern Africa. By that time, the Atlantic expansion of both countries forced the entrance of populations from around the globe; although African slaves were the majority, they themselves came from diverse cultural backgrounds. There are numerous texts from the Early Modern period in which foreigners note surprise at the number of black Africans in Lisbon and Seville (Caldeira 2017). This mixed population made Spain and Portugal unique in the wider context of Europe.

Concerning material culture, the similarities between Portugal and Spain continued for an extended period, which may be seen, for example, in the similarity of sixteenth- and seventeenth-century tableware and transport jars. Whether there was a one-way influence or both countries were simply maintaining practices stemming from a common cultural background, which could go back to the Romans or the Islamic presence, is something worth investigating in the future.

Archaeological excavations, especially in urban areas, as well as research projects have greatly increased in the last two decades increasing the general knowledge about historical archaeology in both countries. Though most of these projects are geographically confined and relate to specific landscapes or cities, they have revealed the evolution of cities and buildings throughout the centuries, as well as how people lived in the past and their reactions to the globalization occurring at the time. The significance of these projects lies in their revealing a past that until the 1990s was not even considered as archaeology, and although the general law protects the sites and material coming from them, they remained poorly studied until 10 years ago.

In sum, there has been no lack of research in Portugal or Spain in historical archaeology in recent years, with numerous papers published every year. The problem remains that most of this research continues to be produced for an internal audience and written in the national languages. Although urban areas and city consumption are well represented in research topics, several lacunae remain. For example, rural areas have seen far less work, making non-urban populations in the sixteenth to eighteenth centuries poorly understood. The same can be said about religious communities such as convents and monasteries, in which only a few papers have been published.

Considering the global importance of both countries in the last 500 years in cultural, political, and economic spheres, there is a comparable lack of internationally oriented academic dissemination. Consequently, it is time for researchers in both countries to join forces and develop joint research projects that could contribute to understanding the reasons for mutual similarities in their respective material culture traditions and colonial contacts in the Early Modern period and engage with the international community.

Historical Archaeology, Nationalism and National Identity in

Alasdair Brooks
The Grand Egyptian Museum (GEM) Project, Hill International, Giza, Egypt

Introduction

The archaeology of nationalism, particularly the study of how archaeological evidence has been manipulated in the service of nationalist ideologies and how archaeological studies have been influenced by nationalist discourses, has been a vibrant field in recent decades. Most studies of the subject focus on prehistoric, classical, or early medieval subjects (see the separate entry on "Nationalism and Archaeology: Overview" for details and citations). But if modern nationalism is, as per Hobsbawm (1991), Gellner (1983), Anderson (1991), and others, largely a product of the post-medieval period, then historical archaeology – the archaeological study of the post-1500 period – potentially has a unique contribution to make as the study of the archaeological signature and impact of nationalism and national identity in the same period that the modern concepts developed.

Definition

For the purposes of the present discussion, "historical archaeology" is defined in the New World sense of postmedieval archaeology from c.1500 AD to the present. "National identity" is then defined as the development of a sense of shared identity and collective belonging within a particular geographical region (which need not be an independent state). Within this context, "national identity" and "ethnicity" are considered closely related but also distinct (see also Hobsbawm 1991:63–71). National identities rest on a complex interaction of factors such as (but not limited to) culture, language, history, religion, tradition, and internal and external perceptions of a group; they can include ethnicity and race, but are not dependent on the latter. These factors defy simple definition. Switzerland demonstrates that a nation with a strong sense of identity can be built out of multiple ethnic and cultural groups with distinct languages. The United States demonstrates that a common culture can be built out of immigrants and descendant groups that maintain some sense of, and often take quite explicit pride in, their ethnic identity of origin. Croatia, Serbia, and Bosnia meanwhile demonstrate that mutually intelligible languages and a recent shared national state need not necessarily generate a shared sense of identity where other factors, such as religion and historical political borders, differ; this despite deliberate attempts to build a common Yugoslav identity under both the monarchy and its communist successor state (on the latter, see Sekulic et al. 1994).

"Nationalism," in contrast, is the political use of national identity. In Gellner's formulation, it assumes that "the political and national unit should be congruent" (Gellner 1983:1), though defining the boundaries of both the political and the national unit is perhaps easier said than done. Indeed, many of the factors that contribute toward both national identity and the definition of a national unit are inherently subjective, whether these are ethnicity, race, language, or a sense of shared history. However, to recognize that something is subjective is not to argue that it lacks emotional resonance or should be dismissed on the basis of its artificiality. This is indeed a core theme in the historical archaeology of nationalism: "recognising and examining the artificial and subjective origins of a particular form of nationalism and national identity often goes hand in hand with studying and understanding why the latter continue to hold so much power in the modern world" (Brooks and Mehler 2017: 9).

Historical Background

The broader archaeology of nationalism and national identity has generated a significant body of work (see the relevant separate entry), but the historical archaeology of the topic has a period-specific role to play. Two key historical forces combined to the development of modern nationalism in the postmedieval world (Brooks and Mehler 2017: 9–11). The first of these was the formulation of the legal framework of European state sovereignty via the 1648 Peace of Westphalia. The second, and much more difficult to define, is the formulation of a concept of national identity based on ethnic identity in the wake of the French Revolution; "a self-conscious national identity formulated via some combination of ethnicity, language, culture, and/or religious identity only develops . . . as different political and social groups attempted, under the influence of the Enlightenment, to define the citizenry of the Westphalian state by their shared characteristics, whether real or imagined" (Brooks and Mehler 2017: 10). It is precisely because the modern nation state derives from the – not necessarily inevitable – interface between Westphalian sovereignty and post-Enlightenment nationalism, and modern concepts of national identity stem largely from the latter that historical archaeology has a unique role to play of the processes that built modern nationalism and national identity. Explicit recognition of this contribution has been outlined in an edited volume on the subject (Brooks and Mehler 2017), but this builds on an existing – and still growing – rich literature on postmedieval nationalism and national identity. This literature cannot be covered in detail in the present discussion, so case studies

and examples should be considered representative rather than comprehensive.

Key Issues/Current Debates

There are two themes in the historical archaeology of nationalism and national identity that can be used as focus points to outline the current state of research. The first of these – and a theme that will be wholly familiar to those studying the interface of nationalism and archaeology from earlier periods – is the use (or misuse) of archaeological evidence to support specific nationalist viewpoints past and present. Taking just one example, Belasus's study of the history of the archaeology of Hanseatic League ships shows the long influence of nineteenth-century nationalist discourses on the interpretation of these vessels. Under the 1871–1918 German Empire, the Hanseatic *Kogge* (cog) was held to be an emblematic symbol of the positive values of "courage, intrepidity, tenacity, and modesty" that were associated with the League and its perceived role as both a "glorious" maritime representative of the German people and a precursor of the nineteenth-century unified German state. It was particularly appropriated as a symbol of the need for, and importance of, German naval expansion in the years leading up to the First World War. Following the Second World War, archaeological research focused more on typological debates, with broad agreement eventually reached that the term "cog" is problematic and that alternative terminology should be based on more technical discussions, though these debates themselves stem from whether to embrace or reject a nineteenth-century terminology that both influenced and was influenced by nationalist discourses. Nonetheless, a term that grew out of the "pro-naval nationalistic zeitgeist of the pre-First World War period" is still in informal use, and the general public are still prone to seeing the "cog" as a positive symbol of a Hanseatic League that remains closely affiliated with German history. Thus an archaeological terminology born in, and designed to support, a very specific nineteenth-century nationalist context continues to influence modern archaeology debate and remains in use with a general public largely unaware of the original context (Belasus 2017).

The second primary theme is the study of the archaeological evidence of the development of modern nationalism and national identity. Here the key focus is on how this development impacted material culture at the time of its creation and use. Nationalist discourses of the post-medieval period often had a direct impact on material culture, and that material culture in turn influenced its users and consumers; but that influence could often change depending on the social or geographical context. Ceramics have been a particular (though by no means the only) focus of this type of study.

In the nineteenth century, many potters in Staffordshire produced transfer-printed designs that drew on concepts of British, Scottish, Welsh, and other identities that had only been formalized under, or were wholesale inventions of, Romantic period nationalism (Brooks 1997, 1999). For example, the close association between the eighteenth-century modern adaptation of the traditional Highland kilt and tartans assigned to specific "clans" (regardless of whether those families were Highland or Lowland) was largely a result of George IV's visit to Edinburgh in 1822 and Sir Walter Scott's decision to celebrate the monarch's visit (the first visit of a recognized reigning monarch to Scotland since 1633) with an elaborate "gathering of the Gael." The sight of the obese monarch in "traditional" dress was the cause of both ribaldry and satire (not least because of his pink tights), but the cultural consequences of the visit were long-lasting. The subsequent production of Scottish-themed transfer-printed ceramics in Staffordshire, England, for export to North America may seem layered in irony, but these objects played an important role in popularizing these newly created (or at least significantly transformed) material symbols of Scottish national identity to an international audience and in placing the previously marginalized Highlanders – hitherto treated with contempt by the majority of Lowland Scots – as the unexpected cultural guardians of "real" Scotland; a process itself both ironic

and paradoxical given the active repression of Highland culture and social structures following the failure of the of 1745 Jacobite Rebellion and the Highland Clearances that were taking place at the very moment George IV was wearing his pink pantaloons in Edinburgh.

Historical archaeologists have also played close attention to how nationalist interpretations of nineteenth-century British ceramics can be adapted or transformed in other social and geographical contexts. In some cases this transformation is relatively minor. In Australia, transfer-printed ceramics were a core part of a broader assemblage excavated at a late nineteenth and early twentieth-century homestead in Queensland, and used to examine how the site occupants negotiated their "Britishness" alongside the emerging Australian colonial identity, and could "accommodate both the competing and complementary ethnicities of simultaneously being British and colonial" (Terry and Prangnell 2009: 108). The latter example uses British ceramics and other material cultures to examine British identity in a British colonial setting; in other settings, the interpretive context can shift dramatically. The use of British transfer-printed ceramics to decorate nineteenth-century church towers in Uruguay, for example, has been studied from the perspective of the formation of a new Uruguayan national identity, with the British ceramics symbolizing ideologies of modernity and liberty that were being actively embraced by a small state sandwiched between its more powerful neighbors in Brazil and Argentina (Schávelzon and Girelli 2015). Here the specific patterns on the ceramics mattered less than what the objects represented; blue transfer prints, for example, were of particular significance in Uruguay and Argentina because of the strong symbolic connection between blue and liberty in the ideological fabric of the emerging states.

International Perspectives

There are significant differences in how the historical archaeology of nationalism and national identity are approached in Europe and the New World, particularly North America, and these reflect very real differences in the relevant geopolitical contexts. The historical archaeology of national identity in Europe has tended to focus on the concept of the ethnic nation as influenced by the combination of Romantic Enlightenment national identity and Westphalian sovereignty. Note that the ethnic nation is not necessarily congruent with the nation *state*, though where a self-identifying nation is not a state, there will often be a strong nationalist movement (as evidenced by – among others – Scotland and Catalonia). In contrast, a long history of political independence and of strong regional traditions can lead to a strong sense of regional identity, without necessarily being conceived of as a national identity or as the driver of a nationalist movement seeking independence as a nation state (see, e.g., Bavaria). Despite these necessary qualifiers, when a post-medievalist in Europe is looking at British (e.g., Brooks 1999), German (e.g., Belasus 2017), or Slovene (e.g., Predovnik 2017) identities, this is usually done within the context of a nation's geographic homeland – stressing that geographical boundaries are often both subjective and contested.

European historical archaeologists also often have to address a sense of cross-period continuity. Where in North America the arrival of Europeans and a written historical record (notwithstanding Mesoamerican writing systems) typically marks a major breach with the past, in Europe separation of the postmedieval from the medieval is often not just undesirable but actively impossible. For example, Belasus's work on Hanseatic League ships, as described above, necessarily addresses both late medieval and early postmedieval evidence. The League reached the peak of its power and prestige in the late fourteenth and early fifteenth centuries, before entering a long decline that continued well into the postmedieval period (Belasus 2017). While consideration of this continuity is not necessary for the archaeological study of postmedieval nationalism, it is often important.

In contrast, what are national identities in Europe are often transformed into narrowly ethnic identities in North America. Ideologically, European national identities in the United States (and much of Canada) were discarded within – or at least subordinated to – their new geographical context. Strong ethnic communities often existed within specific cities and regions, but not as part of an incipient nation state. Only in Quebec has a distinct ethno-cultural identity led to a prominent European-style nationalist movement arguing for a sovereign state on the basis of that identity. The transformation, romanticization, and appropriation of European identities in a New World context have often been the subject of archaeological research, but whether Irish-Americans (Brighton 2009), Dutch-Americans (Janowitz 1993), or African-Americans (Ferguson 2004), these studies typically examine the extent to which distinct identities remain visible in the material culture or are transformed (willingly or unwillingly; consciously or subconsciously) into hyphenated identities in their new environment. Archaeological study of European-style ethnogenesis in North American contexts, such as Fowler and Noel's work on how the development of an archaeology of Acadians mirrored the formation of a self-conscious Acadian identity (2017), remains unusual.

It remains entirely possible to study the formation of new national identities in New World settings, including for multiethnic nation states, whether via the Australian and South American studies mentioned earlier in this entry or Horning's work examining the role of the archaeological site of Jamestown in ideological discussions of national identity in the United States (Horning 2006); but, as demonstrated by the Acadian example, these rarely coincide with the formation of, or a call for, an ethnically based nation state. The latter observation may not prove to be a constant. As this entry was being written, the President of the United States held a campaign rally where his supporters openly called for the deportation of an elected Congresswoman ("send her back!") who happens to be a Muslim Somali who arrived in the United States as a child refugee. While this is not the first time in the history of the United States that race, ethnicity, and religion have informed American political debates on who can be considered a "true" citizen of the country, it helps to demonstrate the extent to which these discourses can prove to be fluid over time, even in a New World setting.

Future Directions

Given the key differences in how nationalism and national identity are approached between Europe and the New World, there is considerable scope for a growth in a comparative transcontinental historical archaeology of national identity, bringing together archaeological evidence from both Old and New World contexts. Important work has already been done in this regard, for example, via Brighton's *Historical Archaeology of the Irish Diaspora: A Transnational Approach*. Here archaeological data from four sites, two each in Ireland and the northeastern United States, were used to both "locate the reproduction of a traditional sense of being Irish" and "track the slow processes of the material manifestations of being indoctrinated into new American social values and behaviors" (Brighton 2009: 10). This transnational approach helped Brighton outline how specific groups within immigrant Irish communities maintained connections with their homeland while they were initially alienated from, but then slowly incorporated into, their new American sociocultural context. There is significant scope for expanding this type of analysis across different sociocultural, ethnic, and national identities across the post-1500 period. This need not be limited to immigrant groups in North America, or originating from Europe. Important communities of (inter alia) Italians in Argentina, Germans in Chile and Paraguay, and Japanese in Peru potentially invite this type of comparative

analysis. In Australia, important archaeological work has been done on the emergence of British and Australian identities (as per Terry and Prangnell's example discussed earlier), but – if the tyranny of distance can be overcome – opportunities certainly exist for expanding the comparative element by greater use of archaeological data from Great Britain. Expansion of a critical analysis of the extent to which immigrant groups adopt – whether consciously or unconsciously – material culture symbolic of specific national identities but representing traditions invented more or less wholesale in the Romantic period would also be welcome.

There is, however, an imbalance in the existing historical archaeology literature on the subject. Historical archaeology is the strongest and most developed in the North Atlantic (notwithstanding robust and internationally significant bodies of work elsewhere, particularly South America and Australasia). This is reflected in the available literature on the subject, where North Atlantic topics, particularly those relating to identity within the islands of Ireland and Great Britain on the one hand and conceptions of ethno-national identity in North America on the other, have been dominant within the literature. To a large extent this simply reflects that historical/postmedieval archaeology is still a developing discipline in much of Europe, as discussed in detail in Mehler's survey of historical archaeology in Central Europe (2013). Outside of Great Britain and Ireland (and often even within Great Britain and Ireland), comparative data that would inform this type of study can be hard to come by. The expansion of a global historical archaeology of nationalism and national identity therefore also requires a more robust Old World historical archaeology that, even if its primary goal need not be a focus on nationalist discourses, can provide data to inform this type of study.

The historical archaeology of nationalism and national identity almost always begins from the premise that a specific identity has formed and that its distinctive characteristics (or, in some cases, the lack or loss thereof) can and will be studied via the material culture record. Studies of why certain national identities failed to form, or critical analyses of how ideological agendas have hampered the development of historical archaeology in specific contexts, are much less common. One example is provided by Dikkaya's study of how Ataturk's new secular and (in conception) monoethnic republican government deliberately rejected the overtly Islamic yet multicultural Ottoman Empire as a national model has hampered the development of an Ottoman historical archaeology within Turkey (Dikkaya 2017). Approaching the issue from a somewhat different angle, Schávelzon and Igareta's study of the history of archaeology on Easter Island outlines how "an archaeological focus on Easter Island's mythic pre-contact past, at the expense of historical archaeology, has distorted both our understanding of Easter Island's history and the process of identity construction" (Schávelzon and Igareta 2017: 329). If in the Turkish case, the lack of historical archaeology is down to a deliberate state ideology of identity formation, in the Easter Island case the lack of historical archaeology has actively hampered identity formation. These two studies offer a welcome addition to the literature, but given the social and ideological complexities of identity formation in the postmedieval period, they perhaps offer building blocks through which this type of study can be expanded.

Finally, as a closing note, this entry has been highly Eurocentric, with nationalism and national identity largely studied through the lens of European identities and/or European colonialism and post-colonialism. Asia and Africa have barely featured. This merely reflects the current state of the historical archaeology literature. Clearly these issues can be studied in Asian and African contexts. Anderson's classic *Imagined Communities* (1991) is not an archaeological study but looks closely at Southeast Asia within its broader discussion. In a more overtly archaeological setting, Exell and Rico (2013) have examined how the construction of contemporary Qatari identity has

influenced approaches to, and interpretation of, heritage and archaeology in the Gulf state. While not a *historical* archaeology study, the latter helps outline the considerable potential of the topic. There is clearly room to grow a historical archaeology of nationalism and national identity in both Africa and Asia, taking into account both the impact of colonialism and the continuity and strength of local cultural traditions.

Historical Archaeology: Indigenous Perspectives and Approaches

Joe Watkins
Archaeological and Cultural Education Consultants, Tucson, AZ, USA
Archaeological and Cultural Education Consultants, Takoma Park, MD, USA

Introduction

In discussing the perspectives of Indigenous populations on historical archaeology, it first becomes necessary to discuss the varied perspectives on the general discipline of history. As James Wilson in his popular history of Native America writes "It is often very difficult to interpret the surviving oral tradition: the written English version of a story not only translates it into another language but also transposes it from the cultural context in which it was originally told"(1998: xxviii). Such interpretation may be necessary in order to "document" the events described by the speaker (such as the oral traditions by the Indian victors at the Battle of the Little Big Horn). It is important to also consider the fact that, even with these limitations, Wilson continues, "Indians are the central characters, rather than simply bit players; in which the importance of their history lies in its significance to *them* rather than for us; and in which the very concepts of history itself is [sic] radically at odds with Western assumptions and beliefs." Other groups, such as the Northern Cheyenne, are concerned that the tribe's "real history" is being lost. As McDonald et al. (1989: 266) note, "Many tribes, however, are now acknowledging the concept that 'history belongs to those who tell it,' and are striving to take action to eliminate inconsistencies between white and Indian accounts."

Definition

Historical archaeology, or, more precisely, archaeology of the historical period, is a branch of the discipline of archaeology that is devoted to using archaeological methodology to illustrate archaeological sites and events that have occurred within the period of time within a region that falls after contact between populations and those groups who have initiated and maintain a written historic record. In this manner, historical archaeology draws together written historic records, oral histories, and lesser known sources in conjunction with archaeological research to create fuller pictures of events that have transpired.

Key Issues

An issue in the relationship between historical archaeology and Native Americans is, as Rubertone notes, "hampered by the undefined role of archaeological findings in what has traditionally been the domain of the ethnohistorian" (2000: 426). Early historical archaeological work began by focusing on sites of historical situations and then working from those sites and chronologies backward in time, the "direct-historical approach" working extremely well in the Great Plains and American Southwest areas. This served "more as a means of gaining a backward glance at earlier cultural periods and less as a critical source of evidence for illuminating the realities of Native peoples' lives and struggles in colonial America" (Rubertone 2000: 427).

In general, the historical archaeology of Native Americans can be divided into four main categories: the archaeology of early contact, the archaeology of military events, the archaeology of frontier contact, and the archaeology of assimilation. Dixon's broader study of the American West (2014: 188) utilizes four themes – colonialism and post-colonialism, landscape transformation, migration and diaspora, and industrial capitalism – with the examination of the colonialism and post-colonialism topic (182–188) most relevant to this study.

Archaeologists looking at the archaeology of early contact in the United States have sought to gain insights into the actions and reactions of groups of people who are thrust into uneasy

contact. In the southeastern United States, early archaeological sites that document events between the Spanish and Native North America peoples can be used, argues Galloway, "as explanations for the origins of changes *following* contact" (1997: 292). Similar approaches might be suggested for the Native American-Russian contacts of California, the Spanish-Southwestern Native American contacts, and the contacts between the French and Native American groups, although each European group interacted differently with the native peoples with whom they came into contact.

The historical archaeology of military events has also been a point of contention among Native Americans and historical archaeology, often because the recorded history of the military event is often told by the victorious (or valorous) military historians. In 1988, Dull Knife Memorial College initiated an archaeological survey to determine the most likely escape route taken by Dull Knife's band of Northern Cheyenne during the "Cheyenne Outbreak" from Fort Robinson, Nebraska, on January 9, 1879. A literature search and results of field investigations suggested that the escape route suggested by the US Army and local historians was in error, and, instead, the most probable route was that described in the oral history of the tribe. "No single piece of evidence was sufficient to reach this conclusion, but the weight of the available evidence leans significantly towards this conclusion" (McDonald et al. 1989: 268). More frequently, however, the Native American version is given subservient positioning in relation to written documents. At the Sand Creek Massacre Site in Colorado, the National Park Service's determination of the most likely site of the massacre (based on archaeological materials) was at odds with the determination made by Cheyenne tribal members based on oral histories. In spite of the conflict with the scientific evidence, the Cheyenne consecrated the site of the massacre at the point established by *their* histories, thereby fixing the significance *of that particular location* (rather than the location determined by the archaeologists) as the location where "the village stood and the massacre began" (Greene and Scott 2004: 115). In this manner, the Cheyenne are content to consecrate their own location supported by their histories and yet allow the archaeological location to coexist with their own.

In looking at the archaeology of frontier contacts, it is important to realize that "Native Americans were never passive participants in the process; rather they were *active agents* … [in] everything that came their way" (Ware 2010: vii, emphasis added). In an analysis of the Townsend site in eastern Tennessee, Marcoux examined Indian occupations at the community level during a time when not only large events created enormous (and long-lasting impacts) but also the time when impacts hundreds of miles away rippled through the Indian habitations of the eastern part of the United States. Such impacts – the ripples across the shatter zone – influenced the lives of towns and community sites. Marcoux (2010) attempted to use the archaeological process and archaeological analyses to answer questions related to the period of initial English contact with the Indigenous populations along the east coast. For example, by examining the variety of pottery styles represented at the Townsend site, he hypothesized that the community was formed by people from different settlements in direct response to the violence and population loss associated with the time of English contact. This tumultuous period of contact, with its disease, warfare, the deer skin trade, and expansion of economic impact, had far-reaching and long-lasting effects on the groups of the area, and the archaeological information can provide insights into ways the local populations not only survived the clash of worlds but also reestablished themselves at the time.

The historic archaeology of assimilation can be viewed as the archaeology of historic sites created by Native Americans but which are nearly indistinguishable from those of surrounding non-Native inhabitants. Robert Brooks (1996: 265) notes: "(A)rchaeologists have been remiss in not examining the profound changes the tribes experienced, and there has been limited study of post-removal southeastern natives." It is not that such studies do not exist. Judy Bense recognizes some of this disconnect and presents some examples of

archaeological research on historic Indian towns and structures (Bense 1994: 297–9, 306–7, 308–9, 317–22). The tribal groups immediately accepted the durable and ornamental European trade goods both as evidence of social status and also as technological items; the tribal groups also shifted in their habitation and subsistence patterns from large towns to smaller farmsteads. Some tribal groups, however (most notably the Seminole and Creek Indians), apparently rejected European items, perhaps as an outright rejection of European influence and a reaffirmation of pre-European native ways. Ultimately, she notes that "Southeastern Indian groups tried both to assimilate into and reject European-American culture, and these strategies are well reflected in their archaeological remains" (1994: 322). Hartley and Watkins' excavations at the Whirlwind Mission site in western Oklahoma (1993: 43–56) noted the appearance of artifacts considered to be "traditional" to the American Indian culture within a so-called Western cultural context. The authors note: "Although the artifact assemblage is overwhelmingly of European-American manufacture, the early twentieth century survival of aboriginal technological traditions is indicated by a few chert flakes and one deliberately worked glass jar base dating to the second decade of the 1900s" (Hartley and Watkins 1993: 50). More recently, Watkins (2017) discusses various aspects of material cultural assemblages from homesteads inhabited by Indigenous and non-Indigenous populations in relation with the frontier and stages of assimilation to draw attention to the fact that the search for "ethnic markers" in artifacts of the historic past may not be profitable for archaeologists interested in the place of indigenous populations in the historical period.

International Perspectives

Indigenous groups in other parts of the world are also becoming involved in research concerning interactions between Indigenous and non-Indigenous people at contact and after through the archaeology of the historical period. However, in some areas, even defining the sites under consideration can be challenging. For example, the Department of Planning and Community Development of Victoria, Australia, limits historical archaeology to "the study of the past through non-Indigenous archaeological sites, artefacts (sic) and landscapes with the assistance of historical documentation" (2012 Victoria Department of Planning and Community Development). Still, other areas of Australia integrate the Indigenous population into the study of archaeology of the contact and early historic periods.

Greer et al. (2002) examine the range of archaeological research involving Indigenous populations in the York Peninsula, New South Wales, and North Western Australia involving communities relating to World War II events, the pastoral industry, and the convict periods of Australia's history. The authors conclude that stronger and more direct involvement of the Indigenous community in the research process creates a tendency to focus on the more recent, remembered history rather than the archaeology of a deep Paleolithic one, finally noting "the separation between indigenous and non-indigenous, so-called 'historic' archaeology, is nebulous" (2002: 283), a point that Kent Lightfoot, among others, has made with reference to North American archaeology. Wendy Beck and Margaret Somerville (2005) also look at the relationships between archaeology of the historic period and oral history as recognized as a result of work carried out from 1996 to 2002 by the University of New England (UNE) and the Yarrawarra Aboriginal Corporation. This work was oriented at utilizing conventional academic research as a means to record "place knowledge" so as "to establish credibility with government agencies" (2005: 469). In their work, they integrate oral history and archaeology without dominance of one discipline over the other, working toward the idea that the importance is not "whether the archaeology is richer or poorer in detail than the oral history, it is about presenting the diversity of place-stories" (2005: 480). Tim Murray, in reviewing the relationship between archaeologists and Indigenous people (2011: 368–370), examines the historical archaeologies of indigenous peoples, primarily post-contact with outside

cultures, offering a very broad and coherent discussion of these burgeoning relationships.

Susan Lawrence and Nick Shepherd (2006: 80–84) provide a glimpse into the relationships between Indigenous people of South Africa and the archaeology of the historic period as they discuss the situation that arose during the excavation of a historic cemetery on Prestwich Street, Cape Town. In their chapter, they note the need for "archaeology to come to terms with what might be characterised (sic) as the necessary entanglements of race, culture, and identity in the post-colony" (2006: 84). In Japan, Hirofumi Kato (2017) has undertaken research to help better place the historical Ainu populations firmly within the otherwise "homogenous" Japanese historical period archaeology.

Future Directions

The historical archaeology of Native American sites can move beyond the mere presentation of vanquished populations at the hands of a technologically advanced conqueror. The idea of cultural change and adaptation, rather than one of pure assimilation, can provide insights into the ways that Native American cultures adapted to external forces in the midst of cultural pressures brought about by land loss, changing land patterns, and pressures to give up traditional ways of life and to convert to European-American ideas or lifestyles – essentially, in a broader sense, the colonialism/post-colonialism divide as discussed by Dixon. The archaeology of Native American sites, Rubertone warns, should not be interpreted as indicative of culture loss and assimilation, but can also be interpreted "in ways that capture a diversity of experience and that challenge accounts in which the variations are finite and predictable" (2000: 439).

The Historical Cosmopolitics of the Mapoyo People

Elis Meza
Universidade Federal de Pelotas, Pelotas, Rio Grande do Sul, Brazil

Introduction

Mapoyo people have a complex history that is very much related to different political processes in Venezuela. Since colonial times up to now, their location has been situated at a "strategic territory" where human/nonhuman relationships are very salient. The colonization process transformed several aspects of indigenous existence in Orinoco region, but Mapoyo people managed to survive. While scholars in the middle of twentieth century proclaimed a cultural death of this group, they were developing "cultural reviving" strategies, which started with linguistic and archaeological research and have been continuing with heritage projects. This resulted in the construction of the first indigenous community museum in Venezuela (2012) and the first inscription of indigenous cultural heritage to the UNESCO List of Intangible Cultural Heritage in Need of Urgent Safeguarding (2014). Mapoyo's cosmopolitics interlinked with Venezuelan political context, enabling their integration of local concerns with the national society major processes. Recently, the development of mega-mining state enterprise in the Orinoco seriously infringes cultural and environmental dynamics.

Definition

The Mapoyo are an indigenous group from Bolivar State, Southern Venezuela (Fig. 1). Linguistically, they have been characterized as Carib speakers. The latest census (2011) declares an average population of around 423 individuals. Most of them are living in El Palomo town; however, some others migrated to closest bigger cities. Their community is constituted by single-family domestic units and a network of sowings, water courses, mountains, animals, plants, and spiritual entities. The Mapoyo presence in Middle Orinoco is testified by colonial chronicles since the eighteenth century, but archaeological remains in the region show a long pre-Hispanic settlement, although cannot be made undeniable cultural affiliations.

Historical Background

At the geographic area where Mapoyo people live, the Middle Orinoco, there have been archaeologically recovered several evidence of pre-Hispanic occupation, such as lithics used by hunter-gatherer populations, dated to 9000 B.P. Also there are significant rock art sites that testify diverse indigenous group interaction in this area. Followed by the entrance of ceramist and farmer

The Historical Cosmopolitics of the Mapoyo People, Fig. 1 El Palomo location. https://www.google.com.br/maps/place/Palomo,+Venezuela/. Accessed on 12 February 2017

groups (Tarble 1985), other dynamics developed. Nonetheless, a significant disruption occurred in the context of Spanish colonization of the Orinoco River. There are historical accounts mentioning Mapoyo people in the Colonial documents together with archaeological and oral history, which presents a long-term history of this group. One of the first narrations about Mapoyo people is when Father Joseph Gumilla [1741] writes: "the Mapoya nation calls the stone that tops and serves as capital to the Barraguan hill, Uruana, and they say that such a stone is the root of the people of their nation" (Gumilla 1965: 109). This cosmological relation perceptible at historical sources shows the importance of specific nonhumans in their social constructed landscapes.

Another example of past/present sociability can be found at summer time, when large quantities of Arrau turtles (*Podocnemis expansa*) go to the Middle Orinoco to put their eggs at riverine beaches. This was a major event existing since the precolonial times and attracted diverse indigenous groups, some of them from distant lands (as Western Llanos, Amazon Basin, the Andes, and the Antilles). Morey and Morey (1975) talk about a big yearly "feria" (exchange spot), where humans and animals were congregated and where along "quiripas" (shell beads coins), turtle eggs were the main attractions. Practically all chroniclers wrote accounts dedicating several pages to describe the huge amount of turtles and their importance to indigenous people and to themselves (e.g., excerpts of Father Gumilla, Father Gilij, Father Bueno, and in the nineteenth century, Humboldt, Chaffanjon in Meza 2013).

The Orinoco River conquest started with a period of sporadic settlement but soon turned a strategic space to dominate northern South American colonies and for the establishment of commercial routes. The eighteenth century onward, diverse military fortifications were constructed along the river. But as the civilizatory project also included the conversion of indigenous people to the Catholic faith, Spanish Crown promoted Jesuit Missionaries to fund "Reducciones" (Reductions). As some of them recognized, indigenous were mostly reluctant to settle at Reducciones, at first due to epidemics that killed a large number of natives (Morey and Morey 1975) but also because their proposal worked as a negation of native cosmological worlds and practices. Nonetheless, the offer of protection against slave raids led by Caribs and Dutchs, and access to European manufactured goods appreciated by indigenous, made possible the establishment of some Missions. The places chosen for these Missions reveal how much they had to insert themselves in already existing spatial and economic dynamics.

It is interesting to compare the location of the Missions (Nuestra Señora de los Ángeles de Carichana, Concepción de Nuestra Señora de

Uruana, San Luis Gonzaga de la Encaramada and Cabruta) and the location of the biggest nesting beaches, suggesting that they were purposely located to control the access to these spaces (Fig. 2). In fact, Father Ramón Bueno (1965: 126) indicates the putting of "guardians" to avoid people entering the beaches during the nesting time, because human presence scares turtles. In his chronicles he says that around "2000 souls from everywhere" bring their canoes (indigenous

boats) to carry turtle eggs and turtle oil. Missionaries offered outdoor masses at the turtle beaches and exhorted indigenous to stay at the Reducciones in order to be able to participate of the recollection, but some of them initially agreed to be granted access to the beaches and then, after charging their canoes, went away. This clearly exemplifies native negotiations following their ways of being. Among the groups mentioned in historical sources are Mapoyo, Atures, Otomacos, Achaguas, Guamos, and Sáliva. Just as the indigenous groups, missionaries depended on turtles to feed themselves. But eggs and oil were also exchange items between indigenous and missionaries and missionaries and other European traders. In any case, missionaries brought some transformations to the indigenous organization for interacting with turtles, but they could not totally disrupt local tradition, expressed at the social consumption of turtles and the technical knowledge of turtle oil production. Turtle oil was used for food preparing, lighting, and it was regularly applied at the body by some indigenous groups, as Otomacos, usually mixed with red colorific Onoto (*Bixa orellana*), and the technical knowledge of turtle oil production. Archaeological ethnography research shows a material continuity in Mapoyo's technical and social processes concerning turtle consumption (Meza 2013).

At Republican period (1830 onward), regional political transformations led to a substitution of the colonial regime to a creole domination. The Mapoyo did not run away to the forest as other groups did but stayed in settlements dependent to the newly created urban spaces (Fig. 3). This had an influence on the adoption of some creole costumes like Christian funerary rituals and developing a "conuco" economy, where manioc was a principal asset (Scaramelli and Tarble 2000). After Independence War (nineteenth century), some indigenous lands were taken by military leaders, who established extractive, agricultural, and livestock industries. Indigenous groups such as the Mapoyo were incorporated to these productive activities through a debt-peonage system (Torrealba 2011). In that scene, Mapoyo were involved in Tonka beans (*Dipteryx punctata*) recollection. Also, Mapoyo's territory was continuously invaded by a "creole" occupation: people attracted by work opportunities who settled at closest villages as "Los Pijigüaos." Later on, in the middle of the twentieth century, new wages of foreigners came over, interested in the mining industry (Bauxite extraction) located few minutes away from El Palomo.

In that scenario, Mapoyo got involved in what they called a "cultural revival" (Scaramelli and Tarble 2000) aimed at underscoring their ethnic position and their right to their land. This started with collaboration in research projects in the areas of linguistic and archaeology. Several undergraduate and master dissertations were developed with Mapoyo's help. These moves also served for them

to gain more contact with national society and achieve institutional and personal relationships that could possibly cooperate with Mapoyo's projects.

Key Issues/Current Debates

Away to an "extinction" image, Mapoyo people proudly manifested their interest to exhibit their history to local neighbor groups as well as national society, and so they built the Murükuní Community Museum (2012), first indigenous museum in Venezuela (Figs. 4 and 5). The museum had several years of negotiation between Mapoyo leaders and state functionaries of cultural institutions as well as conjunct work with archaeologists (Franz Scarameli and Kay Tarble), who approved the repatriation of archaeological artifacts found at Mapoyo territory sites, requested by local authorities at least from 2008 (Durán 2008).

In 2013 they were recognized by the Instituto de Patrimonio Cultural (Cultural Heritage Institute) as national heritage, at the same time that their land demarcation (13,000 ha) was accepted by national government. This is not a common situation as bureaucratic difficulties have produced very few indigenous land ownership titles

from the large number of communities that requested their regularization. In 2014 "Mapoyo oral traditions and its symbolic reference points within their ancestral territory" was accepted in UNESCO List of Intangible Cultural Heritage in Need of Urgent Safeguarding (Fig. 6). That heritage process is crossed by human and nonhuman agency in a specific political context.

The humans are not the only ones who determine the avatars of "the social," but as a profuse anthropological and archaeological literature indicates, there is a co-constitution of people and things (Latour 1993). In that sense, things should also be seen as practitioners of an active role in the heritage condition. For example, in the Mapoyo case, a sword had especial relevance. During several generations, according to the Mapoyo oral tradition, they have guarded a sword offered to them by Simon Bolívar, the Republic founding father, due to their participation aiding the patriots at the Independence War in the nineteenth century (Fig. 7). With the sword, they could choose between money, becoming traders or the legal ownership their land. They took this last one, but

they had no documents to prove it; therefore, the possession of Bolivar's sword and its capacity to mobilize symbolic capital in the current political arena was decisive to achieve the activation of their heritage process.

As Olsen (2010) has been affirming, communities and things are entangled, but it should not be understood only on a local scale but also in its relationship with national and international scenarios. In 2014, with the UNESCO's approval, there was a media spotlight, not in the "oral traditions" in general, rather, as Mosonyi and Suárez Luque (2009) says, in the place of Mapoyo as a "forgotten patriot people." Bolivar's figure was of primordial importance for Hugo Chávez (1954–2013), leader of the "Bolivarian Revolution" and who actually renamed the country after the "liberator" (Venezuelan Bolivarian Republic). In that way, Mapoyo people made use of a scarce political resource to advance their interests in the context of the current government ideological project. Furthermore, human, nonhuman, and landscapes relationships articulate a politics where "cosmos refers to the unknown constituted by these multiple, divergent worlds and to the articulation of which they would eventually be capable" (Stengers 2005: 995). In that sense, Bolivar's sword, the heritage process, as well as the interaction with turtles take part of diverse conjunctures having in common Mapoyo's cosmopolitics.

International Perspectives

One of the main discussions in which Mapoyo participate is the movement toward a different perception of museums. Indigenous museums have constituted spaces of significant resemantization of a hegemonic western idea of museums, tied to a colonial trajectory. The large museums in imperial potencies not only built their collections on a cultural expropriation of foreign objects but also acted as ideological frameworks supporting colonialism. The position of Western superiority was projected through a representation of native impossibility to maintain their treasures with them. Rather, from human bodies to sacred artifacts were exposed to satisfy European curiosity about other people.

But the antiquarian model of the museum in the Enlightenment period, as well as their transformations to current "universal heritage" concept, was to be challenged by different localized, small museums, interested in their own history and their own representation. Scholars researching these non-hegemonic spaces such as James Clifford (1991) assert on the empowering of traditional communities through discussing what a local museum or exposition should contain. Native peoples, formerly excluded from a museum's staff, now take their positions as active actors in their public memory work.

This debate is conducted in North America by native Americans, with several productive experiences that include their participation as co-curators in "western museums" (Kreps 2009) or as curators in indigenous exhibitions, mainly underscoring the importance of their viewpoints on the way museum's practices are produced and the relevance of equitable power relations in cosmological (auto)representation, as much as the discussion of the adequate treatment of material and spiritual realms of "cultural heritage" (Smith 2005).

In Latin America there is a different context intertwined with indigenous museums. Their roots could be traced back to new museology and the claiming for museums to establish their "social function." Among the proposal of a democratization of culture, usually only accessible to economic elites, new museology defended the idea of museums that could discuss political contemporary and insert itself into diverse current realities. Community museums were conceived under these principles, attending the idea of community control and local resources management, as a way to create their museums and not museums about them.

Currently, a regional association for communication between community museums, the Latin American community museum network (Red de MuseosComunitarios de América Latina), with a web site (www.museoscomunitarios.org) and international encounters, contributes to exchange experiences. Also, there are smaller-scale

networks, as Brazilian Ceará Community Museum Network (Rede de MuseusComunitários de Ceará). Both networks aggregate indigenous and nonindigenous museums, such as rural initiatives and urban popular ones.

These museums share several elements, as their local identity reinforcement in front of threats to their territory. It is a search for national society recognition of their ontological constitution, in terms of what Marisol de la Cadena (2010) considers as "partial connections" between national hegemonic politics and indigenous cosmopolitics. That is also Mapoyo context. But one major difference is that most indigenous museums do not participate in the management of archaeological collections coming from their territories. Usually, legal impediments as much as scientific (dis)interest impede a closer relationship between archaeological objects and native communities. Murry (2011) states that while control of material artifacts is still an important debate, indigenous communities have expressed a special interest in the safekeeping of the landscapes containing their memory sites. Thus, indigenous political relationships are resting on processes of dialogue, collaboration, and negotiation (Colwell 2016).

Onuki (1999) reports a long-term experience of a peasant community in the Peruvian Andes, who strengthened their local identity through their communal management of archaeological site of terraces, Kuntur Wasi. As such, the museum served as repository to objects from the past (some of them in gold), but also, it was a space serving community needs, for example, Soccer Mundial games projection.

Therefore, these museums serve to open spaces for other rationalities and museological criteria, but also, they are highly linked with the archaeological repatriation debate in Latin America. Australia, New Zealand, and United States have already dealt even at a juridical state level with native rights to human remains to which they claim descendancy and so the establishment of stipulations such as NAGPRA (Smith and Wobst 2005). Latin America states have greatly ignored these issues, and cases as Argentinean repatriation of skeletal remains to native people (Tehuelche) are very rare. In that sense, the Mapoyo experienced a particular process of repatriation, that not included human remains but artifacts, held under their custody without implying a tense confrontation of state/science representatives and indigenous community.

Future Directions

A "redistributing" discourse was established in Bolivarian Venezuela since Hugo Chavez government, but it did not produce improvements in socioeconomic structure, especially maintaining resources inequality between the capital city and inland. The main industry supporting Venezuelan economy since the middle of the twentieth century has been oil extraction; therefore, its downturn in 2014, along with other political reasons into a very complex situation, led the country into an economic crisis. In that scene, has emerged a new extractive frontier at the Orinoco River.

CAMIMPEG, a military-led state company, was created to direct gold, iron ore, diamond, and, especially, coltan in what they have called a "strategic development zone" that includes 12% of national territory (110,000 km^2). This project called Arco Minero del Orinoco (Mining Arc of the Orinoco) accepted more than 135 international companies to invest and participate. Venezuelan National Assembly's report on this issue declared that this ecologically sensible area including fresh water deposits and protected forest areas would be seriously damaged. Also several indigenous communities are being affected, such as Mapoyo and Piaroa, Enepa, Hoti, Pume, Arawak, Kariña, Pemón, Yekuana, Sanema, Akawayo, and Warao. And along with environment and human and animal populations, memory landscapes would also suffer irreparable alterations.

That context is a major challenge for Mapoyo people in their struggle to maintain their ontological dynamics. Their current and future plans include linguistic recovery, in a conjunct work between the community museum, the local school, and linguistic anthropologist researchers. To contribute with museum self-management,

they are developing a "conuco" area along the museum, where traditional planting knowledge is transmitted, and it also generates a financial support and with the same purpose, a fishing area in the nearest lagoon. Transmission of ancestral knowledge is highly linked with the environment, so large-scale mining is causing serious disruptions. Cultural heritage agreements following UNESCO's declaration should promote respect to Mapoyo's territory, but the intersection of cultural policy and national development projects constitutes a difficult context that southern Venezuelan indigenous peoples will continue to confront.

Historical Ecology and Environmental Archaeology

Peter W. Stahl
Department of Anthropology, University of Victoria, Victoria, BC, Canada

Introduction

Historical ecology is an interdisciplinary research program that studies the dynamic and dialectical interactions between humans and their environments. A relatively recent scientific approach with deep intellectual roots, historical ecology is related to, but differs from, other ecological perspectives by maintaining an anthropocentric focus on humanized landscapes. Stridently eclectic and multidisciplinary in its approach, historical ecology has borrowed from diverse sources including the "new" ecology, history, and geography. It is characterized by a set of core independent postulates which accentuate the impact of humans as keystone species; advocate recursive, nonlinear, and nondeterministic human environmental manipulation; underscore variability in humanized landscapes through time; and appreciate the inseparability of humans and landscapes. Archaeology and historical ecology are also inseparable. Environmental archaeology is essential for historical ecology, while archaeology, by definition, engages in historical ecology through its practice.

Definition

Historical ecology is an interdisciplinary and anthropocentrically oriented research program that is centered on studying the diachronic interactions between human societies and their environments. Historical ecology focuses on the landscape, both as the multidimensional material legacy of human activity and as an agent that actively shapes human actions in time and space through an embedded and dialectical relationship. Human activity, primarily through various forms of disturbance activities, is key to understanding the production of landscapes that are shaped by, and which simultaneously influence, human behavior in an historically contingent relationship. Past human behaviors can therefore be inferred from environmental settings as these are the material records of a culture which becomes physically embedded within humanized landscapes (Balée 2006; Balée and Erickson 2006).

Historical Background

Although a relatively recent scientific approach, historical ecology has deep intellectual roots. The term was earlier used by the late ecologist and paleolimnologist Edward S. Deevey (1964) who characterized a multidisciplinary and historical ecology that was capable of tracing the interactions of culture and environment in far more detail than written history. The idea of humans as historical agents active in the transformation of landscapes is of course traceable to classic antiquity and later Enlightenment philosophy (Balée 2006: 78), but one which was more recently anticipated in the work of historians (Marx and Engels 1970, original 1888) and geographers (Sauer 1925) who explicitly rejected the contemporary existence of forms of nature that preceded human history.

Historical ecology is related to, but differs from, a number of approaches that developed out of an earlier cultural ecology. The latter focused principally on how culture adapted to non-transformable and manifestly balanced equilibrial environments, thereby placing little to no emphasis on human agency. Human behavior was

largely considered as a disruptive force in the environment, and where anthropogenic disturbance was ephemeral or small in scale, homeostasis could be restored after removal of the disturbing agent. As such, cultural ecology was limited in its ability to explain anything but small-scale and technologically simple cultures that could be considered as adaptive when their ephemeral or sustainable activities enabled environments to retain or return to some preexisting "natural" condition (Balée 2006: 79). Through distancing itself from notions of steady-state ecosystems and functional adaptations, historical ecology is allied with the "new" or "dynamic" ecology which gained traction in the 1970s. Environmental balance, equilibrium, and homeostasis were replaced with instability, disequilibrium, and chaotic fluctuations, regardless of whether they occurred in the presence or absence of human action (Botkin 1990; Zimmerer 1994; Scoones 1999). Although the new ecology shared basic perspectives with historical ecology, its own historical divergence from systems ecology was facilitated through concepts developed in population and evolutionary biology. Historical ecology differs from the new ecology primarily through its strident anthropocentric focus and insistence on the holistic study of humans embedded within their landscapes through time and across space. This sets it apart from most materialist perspectives which variably emphasize the separation of humans from nature.

In accordance with its multidisciplinary perspective, historical ecology also utilizes concepts originally associated with the twentieth-century French *Annales* school of historiography. Dialectical processes between humans and humanized landscapes occur over differing temporal scales. These include short-term events (*événment*), much like the "punctuated equilibrium" of paleontological events; repetitive statistical patterns or cyclical episodes (*conjuncture*) that might occur within the time span encompassed by a human life; and the critically important long-term history (*longue durée*) which for most of the temporal span of human existence can only be made accessible through archaeology (Crumley 1998; Balée 2006: 80). It is the long-term perspective of historical ecology that is particularly powerful and one that corresponds well with the techniques, methods, and scope of environmental archaeology. The recognition of deep antecedent structure as the legacy of past human populations, one which also continues to carry important implications for contemporary human populations, certainly approaches the synthetic and multidisciplinary ecology that Deevey (1964: 34) saw as a bridge between the humanities and the behavioral, social, and earth sciences. This is made manifest particularly through highlighting its focal referent, the landscape (*paysage*), which records intentional and unintentional human action through time and across space. A focus on landscapes is highly integrative as it is a shared analytical unit in archaeology, geography, ecology, geomorphology, architecture, art, and regional planning (Crumley 1998).

Landscape is the paramount concept in historical ecology (Balée 1998a). The ancient western notion of the garden where humans habitually interact with various life-forms is the underlying premise of the landscape (Balée 2006). It provides the key analytical portal for studying the dialectical relationship between humans and their environments through time and across space. Eschewing adaptationist perspectives, historical ecology emphasizes the humanization of landscapes; instead of sociocultural and political systems adapting to environments, environments are adapted by human systems to facilitate their particular needs and desires. Landscapes are treated in their totality as multiscalar, diachronic, and holistic units that embed the patterned material manifestations of culture. As such, humanized landscapes are studied as artifacts from which human intentions and actions can be inferred through time and across space (Balée and Erickson 2006). Due to their central role in the modification and creation of humanized landscapes, humans are considered as keystone species, a term that ecologists have used since the 1960s to refer to any species whose impact on the ecological community is usually greater than that of any other member because their presence is considered to be particularly crucial for maintaining both organization and diversity

within the community (Mills et al. 1993). The principal mechanism by which humans assume the ecological role of a keystone species is through disturbance, which is a universal hallmark of modification by humans in the process of adapting landscapes to their particular requirements. The process is recursive, dynamic, and nonlinear, for as humans modify the landscape, they establish an historically contingent trajectory which directs all subsequent landscape history. Landscapes are both products of, and templates for, human actions (Scoones 1999: 493).

Key Issues/Current Debates

Anthropologist and ethnobiologist William Balée (Fig. 1), a key historical ecologist, considers historical ecology to be a partially accepted research program within the scientific community. It is characterized by a set of core independent postulates which (1) accentuate the deep temporal and globally spatial extent of human impact; (2) advocate the recursive, nonlinear, and non-deterministic trajectory of human environmental manipulation; (3) underscore the historically variable relationships between different societies and landscapes over time; and (4) appreciate the importance of understanding humanized landscapes in their totality (Balée 1998b, 2006).

Postulate 1: Human Activities Have Had a Significant Impact on the Non-Human Biosphere

The older adaptationist perspectives of ecosystems and cultural ecologies were predicated on the notion of stability in nature. They required belief in equilibrium, homeostasis, and orderly succession, which are ideas with ancient roots in western thought (Botkin 1990). They in turn necessitate the teleological assumption that a pristine nature must exist in an original and unspoiled (particularly by humans) condition and that a subsequently spoiled (particularly by humans) nature can return to its prior state in the absence of the disturbing agent. The idea that human activity was capable of transforming environments also has a deep history in western thought, beginning with Classical philosophy, continuing through the Enlightenment, and into the nineteenth and twentieth centuries, as historians and geographers questioned the existence of pristine conditions. In 1845, Karl Marx considered that a nature preceding human history "...is nature which today no longer exists anywhere (except perhaps on a few Australian coral-islands of recent origin)" (Marx and Engels 1970: 63). In his latter characterization of natural and cultural landscapes, geographer Carl Sauer believed that the former no longer existed in its entirety in many parts of the world (Sauer 1925). The concept of pristine environments is today considered to be a myth (Denevan 1992), one which is probably more like an old and cherished wish rather than an established fact. Wherever humans have been present, "natural" environments have been altered, and once altered they never revert back to a "natural" condition (Balée and Erickson

2006). An important question about an assailable nature concerns the temporal depth of human impact. Does it span the entire temporal range of genus *Homo*? Does it begin with the appearance of modern humans? Is it associated with the early Holocene advent of agriculture, or as some would prefer to call it, the Anthropocene? Agricultural humans are perhaps the pinnacle of disturbance agents, although all humans regularly modify landscapes regardless of their particular subsistence orientation. Indeed humans are unique only in terms of the scale to which they have modified landscapes and the degree to which they have intentionally planned their modification (Balée 1998b). Niche construction is a general and pervasive feature, and one which has likely influenced the ecology and evolution of many different species. Defined as the "activities, choices, and metabolic processes of organisms through which they define, choose, modify, and partly create their own niches" (Laland et al. 2000: 132–3), niche construction can proceed through the building of artifacts or benign habitat modification and can be undertaken by diverse life-forms. In all cases, descendant generations receive constructed niches as *ecological inheritance*; however, because it is dominated by learned knowledge and cultural inheritance, human niche construction is "unusually potent" (Laland et al. 2000: 141). It underscores the ecological role of humans as a keystone species. As the ecological impact that cultural humans assert on the landscape is both quantitatively and qualitatively greater, they assume a dominant and critical role in structuring the ecological community. Human activity affects all other organisms within the landscape and plays a key role in determining the kinds and numbers of different species within the community (Mills et al. 1993).

Postulate 2. The Effects of Human Activities Are Neither Inevitably Linear Nor Deterministic

The equilibrial perspectives of ecological systems that were premised on the assumption of stability and balance in nature, and which dominated scientific discourse on the relationship between humans and environments, have been supplanted by an increased appreciation of history, variability, complexity, and uncertainty (Scoones 1999). Despite the tenacious hold that metaphors of balance, regulation, and harmony have in anthropology, historical ecology can be a productive arena for coalescing contributions of the new ecology within the social sciences (Scoones 1999: 490). Historical ecology is particularly interested in the complex relationship between humans and their environments which is manifest in landscape change through time and across space. With this interest, historical ecology understands the dynamic interaction between cultural and ecological processes. Humanized landscapes are dynamic and recursively created in nonlinear, nondeterministic, and historically contingent ways. Their unique histories can be accessed by studying humanized landscapes as cultural artifacts. Furthermore, the holistic study of historical ecology appreciates the complexity, nonlinearity, and indeterminacy of humanized landscapes as historically contingent artifacts. The contingent perspectives of historical ecology and its rejection of equilibrial assumptions avoid essentializing an ecological role for humans in their interactions with landscapes. Humans are neither cast as obligate destructive agents (*Homo devastans*) whose activities necessarily degrade the environment through decreasing species richness, nor are they stereotyped as "ecologically noble savages" harmoniously adapted to, and existing ephemerally within, a balanced ecosystem (Balée 1998b). Humans, like any niche-constructing organism, are disturbance agents, except for the fact that humans are unique keystone species whose cultural equipment enables them to assert a quantitatively and qualitatively greater influence on the landscape. Nor should disturbance be automatically considered as ecologically destructive; rather its subsequent effect on the landscape must be understood in terms of degrees along a continuum. Empirical and mathematical modeling suggests that intermediate disturbance can lead to higher species richness (Fig. 2). At either extreme of the continuum, species richness diminishes as stable or undisturbed communities are characterized by a tendency toward monopolization by a few dominant species, whereas

Historical Ecology and Environmental Archaeology, Fig. 2 Simplified model of the relationship between species abundance and disturbance intensity. (Reprinted, with permission, from the Annual Review of Anthropology, volume 35 © by Annual Reviews www.annualreviews.org)

catastrophic widespread and continuous disturbance radically decreases community complexity. Spatially and temporally localized instability prevents monopolization by a few while simultaneously presenting new opportunities for others (Connell 1978).

Postulate 3. Different Human Activities in Different Contexts Can Lead to Different Outcomes

Historical ecology emphasizes the dynamic nonlinearity and indeterminacy of environmental change advocated by the new ecology and stresses the historically contingent nature of humanized landscapes. Landscapes, once modified, never return to a "pristine" or "original" state but are produced through time and across space in dialectical fashion. Different social arrangements with different actors in different locations at different times can produce different outcomes (Scoones 1999: 494). For example, it has been conclusively demonstrated that Amazonian agroforestry can contribute to comparable if not greater species richness in old fallow fields when compared to species richness in surrounding high forest. However, fallow formations differ from high forest formations as they tend to be characterized by unique species. Also, disturbance indictors are the ecologically most important species in fallow, whereas their ecological counterparts in high forest are indicators of non-disturbance (Balée 1994). Many different kinds of biological enhancement are recorded in neotropical landscapes that are and were humanized through indigenous agroecological systems, including Kayapó apêtê forest islands in the Brazilian cerrado, raised field systems in savannas, anthropogenic forests, and dark earths (ADEs) throughout the Amazon basin and beyond (Balée 1998b; Balée and Erickson 2006; Erickson 2008). Conversely, biological degradation has been recorded in certain landscapes, especially island habitats which are particularly vulnerable to local extirpation of endemic species whether through intentional human exploitation or unintentional habitat destruction or introduction of exotic invasives. However, Balée (1998b: 23–4) has suggested that it is only within the context of ancient and modern state societies, in particular, that associated biodiversity reduction and decreased habitability have been solidly recorded. Whether state societies are intrinsically destructive or not remains an ethnographic and historical question, not a biological one. In any case, the results of human activity are not deterministically programmed.

Postulate 4. Humans and the Landscapes in Which They Interact Are Mutually Interdependent

Landscapes are both products of, and templates for, human actions (Scoones 1999: 493). Historical ecology emphasizes the humanized character of landscape and in doing so rejects the dualistic separation of humans and culture from landscapes and ecology. The anthropocentric focus of historical ecology emphasizes the ecologically important activities of humans within landscapes and simultaneously considers the effects of landscape modification through time on the human condition. In ecological terms, humans might be characterized as particularly dominant and somewhat unique keystone species; regardless, it is in the material manifestations of landscapes that humans and

environments can be considered as inseparable (Balée 1998b: 24).

Historical Ecology and Environmental Archaeology

It is specifically in the notion that landscapes can be studied as material artifacts of human behavior that culture and environment appear inseparable. It is also where environmental archaeology assumes particular importance not only for an understanding of the past but also for issues that transcend traditional subdisciplinary and disciplinary boundaries in archaeology and anthropology (Hayashida 2005; Stahl 2008). The historical ecological study of landscapes is strongly multidisciplinary. Balée and Erickson (2006: 7) emphasize that the primary data of historical ecology lie in the patterning of material residues, anomalies, and cultural imprints that human activity has inscribed in the landscape. These data are necessarily captured through an interdisciplinary application of techniques and methods as they minimally include genetics, plant and animal domestication, agroecology, soils, inventories of biological and agroecological diversity, hydraulic engineering, linguistic terms, environmental memory and oral histories, archaeology and material culture, and actualistic studies (Balée and Erickson 2006: 7). Archaeology and historical ecology are inseparable. Archaeology, through its techniques and methods, is essential for historical ecology, as its can access a "deep time" that is inscribed within the landscape yet far exceeds human memory and the advent of written records. Environmental archaeology is an entrée to data used for the establishment of reliable inferences about past ecologies. These are inscribed in the landscape in the form of preserved and retrievable information that is either directly relevant to or indirectly implicated as proxies for establishing past conditions. Simultaneously, whenever archaeologists retrieve data from landscapes or from the buried record of archaeological sites, they are exploring anthropogenic phenomena through time and across space and are by definition engaging in historical ecology. Furthermore, archaeologists practicing historical ecology are not simply learning about the past. Their interpretations can have serious consequences in contexts where indigenous rights are juxtaposed with issues of biodiversity management. They also have direct relevance to issues ranging from preservation and conservation to ecological restoration, rational development, and the elusive goal of sustainability (Stahl 2008).

International Perspectives

Historical ecology has rapidly become a major global research program. Specifically designed historical ecological research initiatives are retrieving important results and developing provocative interpretations in every continent and progressively more crucial insular contexts. Although it is an important perspective with temporally deep intellectual roots, the historical ecological approach in all its forms has been variably embraced at different times and in different places. Certainly, the minimal acceptance of the human capacity to transform landscapes has been better appreciated in Europe for decades, but it has been in the western hemisphere where the most dramatic recent developments have been undertaken. This is undoubtedly attributable to the intransigent and lingering belief that indigenous populations could only have affected a benign and ephemeral presence prior to the arrival of Europeans in the late fifteenth century (Delcourt 1987; Denevan 1992). A similar viewpoint was traditionally also projected onto many of the world's tropical areas. Historical ecology has become a dominant research program in the neotropics and particularly throughout the Amazon basin where its practitioners have countered long-held views that pre-Columbian populations were small, dispersed, and both technologically and socially simple. This viewpoint is being rapidly discarded, and in the process, some of the most dramatic and exciting empirical discoveries and theoretical formulations of historical ecology are emerging today from contemporary studies in the neotropical lowlands of the western hemisphere (Erickson 2008).

Historical Ecology in Archaeology

Carole L. Crumley
University of North Carolina, Chapel Hill, NC, USA

Introduction

Edward S. Deevey, who directed the Historical Ecology Project at the University of Florida in the early 1970s, introduced the term "historical

ecology" to archaeology. Working with archaeologists on Mesoamerican lake sediments, Deevey's integration of archaeology and paleoecology was visionary. Deevey's son Brian finds the first mention of historical ecology in his father's publications of 1964 (Brian Deevey *pers. comm*. 2009).

In the early 1980s, historian Lester J. Bilsky solicited the contributions of anthropologists, a human ecologist, an economist, and fellow historians for *Historical Ecology: Essays on Environment and Social Change* (1980). Anthropologist Alice Ingerson organized a session on historical ecology at the 1984 annual meeting of the American Anthropological Association. This session addressed the chasm between cultural (e.g., nature as metaphor) and environmental (e.g., energy cycle) studies within anthropology and explored political economy and social history approaches in the discipline.

By the late 1980s, Carole Crumley and William Marquardt – drawing on anthropology, archaeology, history, and the biophysical sciences – employed historical ecology in the study of long-term regional change in Burgundy, France (Crumley and Marquardt 1987). Later, they collaborated with colleagues in archaeology, evolutionary ecology, and anthropology to produce the edited volume *Historical Ecology: Cultural Knowledge and Changing Landscapes* (Crumley 1994). Independent of Crumley and her colleagues' work, William Balée and his colleagues, working in South America, enriched the traditional cultural ecology approach to include history. Balée organized a conference of anthropologists, historians, and geographers at Tulane University in 1994; the papers were published as *Advances in Historical Ecology* (Balée 1998). The same decades also witnessed the development of political ecology, which directly addresses the political economy of contemporary environmental processes and practices (Robbins 2012). There are obvious resonances with historical ecology. Because we act out our thoughts on landscapes, the history of landscapes can be seen as "congealed" politics: outcomes of the struggle over resources and ideas (Crumley in Sinclair et al. 2010: 10).

Working together since the mid-1990s, Balée and Crumley furthered the approach of historical ecology with the creation of two fruitful publishing venues for historical ecology. The first was a Columbia University Press series which produced seven volumes, including Balée and archaeologist Clark Erickson's exploration of deep-time biodiversity in the Amazon. Balée and Crumley's current series focuses on applications of historical ecology and is published by Routledge.

Historical ecology has another source, derived from forest history and restoration ecology (e.g., Swetnam et al. 1999; Egan and Howell 2001; Foster and Aber 2004; Jackson and Hobbs 2009; Burgi 2011; Szabo and Hedl 2011; Grossinger 2012; Jackson 2012). While drawing initially on geography and environmental history, the expanding framework for such research has come to resemble the strand of historical ecology found in anthropology and archaeology, in that it addresses community involvement, a longer time frame, and contested visions for modified landscapes. The involvement in landscape management of diverse stakeholders, along with the political issues they represent, requires an integrative approach both to understand current-day ecosystems and landscapes and to plan their future. In multiple-use landscapes, such as public lands and urban spaces, managers must understand the combined physical and social history of the ecosystems and landscapes in their charge. Archaeological evidence plays an important part both in developing landscape histories and in developing new strategies for more integrated and functionally robust landscape management.

Definition

For archaeologists and others who study the linked past of humans and the environment, historical ecology is a cluster of concepts in a practical framework for studying the past and future of that relationship (Crumley 1994, 2007a, 2012; Balée 1998, 2006; Meyer and Crumley 2011). While historical ecology may be applied to spatial and temporal frames at any resolution, it finds

particularly rich sources of data at the "landscape" scale – where human activity and cognition interact with biophysical systems and where archaeological, historical, ethnographic, environmental, and other records are plentiful.

The term *historical ecology* employs a definition of ecology that includes humans as a component of all ecosystems. Its definition of history is not limited to the written record but encompasses both the history of the Earth system and the social and physical past of our species. Historical ecology constructs an evidence-validated, open-ended narrative of landscape evolution and transformation. It follows the dialectical interaction between (spatially and temporally) diverse human activities and changing environmental conditions.

Historical ecology may not be familiar to every archaeologist, but its salient characteristics will be recognized as those which undergird most archaeological practice. Chief among these is a collaborative, transdisciplinary research environment. Historical ecology perforce draws on a broad spectrum of concepts, methods, theories, and evidence, taken from the biological and physical sciences, the social sciences, and the humanities.

Some examples of the power of this transdisciplinary approach are helpful. Traditional/local environmental knowledge can be equally valued and scrutinized along with scientific evidence: this requires a combination of field biology and other natural science disciplines, archaeology, written and oral history, and ethnography (e.g., Balée and Erickson 2006; Crumley et al. 2018). Because cultural landscapes are inherently political, the combined study of biogeophysical processes with historical and political ecology can expose social forces active in their formation and more completely analyze decision outcomes. Systems ecology offers a provocative heuristic approach, termed "resilience," to the study of complex adaptive socio-ecological systems over time (Folke et al. 2004). While the resilience concept has several drawbacks, it can focus archaeologists' interpretation of past system changes on issues that have immediate current applications (Costanza et al. 2012; Plieninger and Bieling 2012). More generally, complex adaptive systems theory contributes concepts such as initial conditions, emergence, and path dependence to the analysis of these ancient systems, broadening the archaeological study of change across time and space and into the future (Redman 2005).

Historical ecology enhances collaboration among differently trained researchers. It takes into account a project's stakeholders who could be impacted by providing an intellectual meeting place where diverse knowledge communities can exchange information about the past and present of a physical region and discuss various courses of action for its future. Of course, such exchanges require a strong commitment to dialogue, extensive translation, and significant efforts at coordination. Nonetheless, standard analytic procedures of these various disciplines are respected; the information thus derived provides critical "cross-checks" upon other data sets, revealing new patterns and encouraging researchers to ask further questions. From the beginning of the project, agreed-upon goals and frequent interaction underlie successful collaboration.

Key Issues

What term of theoretical reference should be used to describe historical ecology? It is not a discipline, recognizable in the equipment that practitioners employ; the material or phenomena that they examine; the research questions, methods, and hypotheses; and the results that they obtain. Because each archaeological "case" (e.g., site, research question, and availability and quality of the material record) is different, practitioners of historical ecology are far more concerned with a pragmatic approach to particular circumstances, using what is available to build a narrative of landscape history. Neither is historical ecology a method, meaning that particular procedures and techniques are employed.

Historical ecology is not a theory, in the sense of a proposed explanation of empirical phenomena. While there are certain postulates which are largely (but not universally) agreed upon (Balée 1998: 14, 2006: 2), historical ecology does not explain so much as it provides the tools to build a

body of data that can be inductively assessed. Balée is a strong advocate of the notion that historical ecology is a body of theory, identifying "a core of interdependent postulates" used to explain human/biosphere interactions. While his postulates do capture a number of the concerns that are central to historical ecology, "theory" implies that certain interpretive positions follow from them. However, the inductive approach of historical ecology admits many interpretive frameworks, as does archaeology in general. While archaeological fieldwork and analysis are tied to a broadly scientific approach to the data, the interpretation of those data reflects the archaeologist's attachment to particular theories of human agency and action, whence come the research questions that led to fieldwork. Thus historical ecology does not claim exclusive association with any theoretical approaches, other than embracing holism.

Having ruled out historical ecology as a discipline, method, or theory, what is left to describe it? Perhaps Winterhalder's characterization of the field as "an investigation within a framework provided by a certain set of concepts" (in Crumley 1994: 18) is most satisfying. Concepts are flexible, both in the breadth of their applicability and in the fact that they are subject to change. Historical ecology is a cluster or "toolbox" of concepts. This is an antidote to entrenched approaches in that the research design is necessarily broadly collaborative, thus ensuring many perspectives. It is also unabashedly particularistic, in that every site, landscape, or region has a unique history and particular resources that can tell its story.

Aside from its academic role, there is also an applied aspect to historical ecology. For example, the US National Park Service employs a historical ecology approach to manage and interpret the enormous national park system, which must respond to the often contradictory needs of many users (e.g., conflict between rock climbers and Native Americans who consider Devil's Tower, Wyoming, a sacred site). The Society for Ecological Restoration International (SER) frames its research and instructional programs around historical ecology. The San Francisco Estuary Institute (SFEI) is a pioneer in using historical ecology to track linked biophysical and anthropogenic changes in wetlands. The Swiss Federal Institute for Forest, Snow and Landscape Research (WSL) hosted an international conference on Frontiers in Historical Ecology as recently as 2011, an event that underscored the rapidly entwining origins and histories of historical ecology.

Current Debates

Complexity science is the transdisciplinary study of *complex adaptive systems* (CAS) (for an introduction by archaeologists, see Beekman and Baden 2005). They are dynamic, nonlinear systems that are not in equilibrium and do not act predictably, which aptly describes systems that include humans. These key features also distinguish contemporary complex systems thinking from earlier systems theory, which assumed that "natural" systems could be modeled with a few key variables and would return to equilibrium after being disturbed. The CAS concept represents a highly practical "multi-tool" (Meyer and Crumley 2011: 112) in the historical ecologist's toolbox, introducing useful ideas such as system history, initial conditions, path dependence, and emergence. In concert with the more heuristic idea of resilience, referring to systems that do not degrade critical resources (Berkes et al. 2003; for an archaeological perspective, see Redman 2005), these conceptual tools allow archaeologists to think across time and space (thus following the evolution of specific societies and comparing them over the *longue durée*) and to ask questions whose answers have relevance today (Butzer 2005; Costanza et al. 2012).

More familiar concepts such as *diversity*, *region*, and *scale* also have an important place in the toolbox. As Evelyn Pielou demonstrated several decades ago, *scale* defines diversity. We must think of scale both in terms of how systems organize themselves and in terms of how we, in turn, study them. Scale – spatial, temporal, economic, social, and/or political – is of central importance to the archaeologist. It is in addressing this issue that archaeologists describe diversity in the past. If we choose the wrong analytic scale, we may

miss critical evidence of similarity or difference. The same is true if we fail to recognize that systems organize themselves at multiple scales which differ from one another and which evolve. To follow regional change over time, one must be able to work across changing analytic and systemic scales.

In order to understand change in the past, the traditional approach has been to establish a temporally ordered chain of events, termed *causation*, which allows generalization about the system. But because complex systems, like human societies, are comprised of properties that can change at various temporal and spatial scales and can interact in unanticipated ways, a simple temporal ordering of events cannot describe "causal" interactions among variables. While in complex systems a clear line of temporal causation is compromised, it is possible to analyze profound change in the nature of the system (termed a *regime shift*) by identifying the variables that concatenate to bring about the change. This requires a meta-theoretical approach that takes into account the properties of dynamical systems that frequently include human societies.

Variables that change quickly are only the most recent arrivals in a series of rapid, not-so-rapid, and slow variables within these systems. For example, a plant disease causes system collapse only after agricultural lands have been slowly depleted of nutrients *and* after local populations have decided to specialize in a limited number of plant crops. Archaeologists – with their close attention to scales of time and space – are perfectly poised to study not only rapid variables but also the slower, less easily identified variables which operate during periods of seeming system stability. Historical ecology enables archaeologists to study such periods of apparent inertia, encouraging us to seek evidence of slow variables in regional and local contexts.

Historical ecology draws from several strong historical traditions. Beginning in the 1920s, the French historical school *Annales* (Burke 1992) broke with traditional event-focused disciplinary history and instead emphasized context, incorporating geography, ethnography, and folklore as well as environmental science. The humanistic and dialectical *Annales* approach gave rise to a new collaborative framework for the study of regional history (e.g., the work of Braudel, Duby, and Le Roy Ladurie). Especially useful is the concept of processes operating among temporal scales of varying duration: these broad divisions are termed *événement* (event), *conjoncture* (cultural and historical context), and *longue durée* (long-term trends). Broad temporal frameworks, such as those that characterize an *Annales* approach, guide all historical sciences. Interpretation must rely on all three: events, whether they are a cleric's account of famine or stratigraphic evidence of flood, must be set in immediate and more distant contexts. The central *Annales* concept of landscape (*paysage*) allows researchers to address time and space simultaneously, follow intentional and unintentional acts, study human modification of the global ecosystem, and assess past events in shaping human choice and action. The study of changes in the temporal and spatial configurations of landscapes (a traditional pursuit of archaeology), along with work in cognition, offers practical means to integrate the natural and social sciences and the humanities.

Any discussion of causation in the systems of which humans are a part necessarily leads to *agency*. Agency has a long history in Western social theory (Dobres and Robb 2000). The last three decades have seen a revival of agency thinking throughout the social sciences, largely in response to the work of practice theorists Pierre Bourdieu and Anthony Giddens. Actor-network theory (ANT), most closely associated with Bruno Latour, describes human society as a complex, interactive, and iterative collective of human and nonhuman actors; no effective "science of the social" can exist without including both humans and nonhumans (Latour 2005). Studies that explore the agency of objects and living beings can provide models for exploring the complex ecological collectives/systems of which humans are a part (Ingold 2000).

It is important to note that complex adaptive systems have no overarching hierarchy of dominant/determining "stimulators" and subordinate "responders." Rather, they are complex *heterarchies* of interacting elements that may

sometimes stimulate and at other times respond and that may sometimes dominate the system and at other times may be dominated. A promising development in complex systems research is the concept of heterarchy, "which treats the diversity of relationships among system elements and offers a way to think about systemic change in spatial, temporal, and cognitive dimensions" (Crumley 2007b: 468). Originally developed in brain research, definitions of heterarchy are remarkably consistent across a vast array of disciplines, including artificial intelligence and computer design, mathematics, and sociology. Heterarchy refers to the relation among elements in a system in which they are unranked, or possess the potential for being ranked in a number of different ways, depending on systemic requirements (Crumley 1979: 144). Heterarchies stand in contrast to hierarchies but do not replace them; rather the two exist in dialectical relationship with one another. Heterarchy is a corrective to the naturalized characterization of power relations, which conflates hierarchy with order.

Future Directions

It is important to remember that historical ecology extends the concept of heterarchy not only to the material being studied but also to the conceptual framework of that study. As a transdisciplinary endeavor, historical ecology recognizes the contribution of many different kinds of researchers and types of data. Correlating the contributions of these researchers and integrating their data represent two of the biggest challenges of an historical ecological approach but also account for the richness of the understandings obtained. A set of operational principles guide research design (Meyer and Crumley 2011). Among the most important are collaboration from the beginning, ground rules that admit qualitative as well as quantitative data, "best practice" protocols, and other agreements that respect diverse knowledge communities.

The *Integrated History of the People of Earth* (IHOPE) is a global network of researchers (many of them archaeologists) and research projects that uses historical ecology's integrated approach to study combined human and Earth system history (Costanza et al. 2007; Sinclair et al. 2010; Costanza et al. 2012). IHOPE's long-term, human-scale perspective is intended as a corrective to Earth system science-based models that often exclude place-based ways of knowing the world. Such models, using relatively recent data and not taking into consideration long histories of human-environment interaction, cannot steer society toward long-term sustainability. IHOPE's vision affirms the need to critically evaluate these models and the relevance of archaeology in demonstrating that by searching the past, we can find clues to our future.

Particularly exciting is the possibility that organizations and communities that seek to avoid further degradation of the planet could work with those that would conserve human history or culture. For example, the Yucatan peninsula and the Amazon basin are regions of great biodiversity and also places that warrant cultural, linguistic, and heritage conservation (Maffi and Woodley 2010). Moreover, as several historical ecology studies have demonstrated, much of the biodiversity found in these landscapes has emerged as a direct result of human presence and the patterns of ecological mutualism that have evolved between humans and nonhuman species over the *longue durée* (e.g., Arroyo-Kalin 2010). Today many archaeologists have shifted their work from monumental architecture to ancient infrastructure in an effort to learn about place-based management solutions that are sturdy, inexpensive, and relatively easy to maintain. Archaeology, with its ties to groups that safeguard biological and cultural heritage, and with knowledge of the myriad experiments that are part of our human past, can play an important role in linking efforts to safeguard human history while envisioning an equitable and secure future.

Historical Metallurgy Society Ltd.

David Cranstone
Historical Metallurgy Society, London, UK

Basic Information

Historical Metallurgy Society
1 Carlton House Terrace
London SW1 5DB, UK
Primary contact:
Honorary Secretary (currently David Cranstone), secretary@hist-met.org
Website: http://www.hist-met.org/

The Historical Metallurgy Society is the lead body for those interested in the past of metals and metal-working, from the earliest origins to the present day. Although UK based, its interests, membership, and publications cover the whole world. The Society is a registered UK Charity (No. 279314) and a Company limited by guarantee (England and Wales No. 1442508).

The Society celebrates its fiftieth anniversary in 2012–2013. It was originally set up by academic and industrial metallurgists interested in the past of their subject, as the Historical Group of the (UK) Iron and Steel Institute, but is now an independent society whose membership includes metallurgists, metal-industry workers, archaeometallurgists, archaeologists, historians, craft blacksmiths, members of related professions, and academic disciplines, and those whose interest in the subject is entirely amateur. Membership is increasingly international, with 36 countries represented in January 2012.

Major Impact

The Society aims to promote research, conservation, and experimental archaeology; disseminate knowledge and understanding; and promote discussion, throughout its subject-area and throughout the world. It does so mainly by the following.

Publications

The Society publishes a refereed academic journal, *Historical Metallurgy*, issued twice per year, and an informal *Newsletter* produced three times per year. It also produces monographs and Occasional Papers on an intermittent basis; most of these have been conference proceedings but other material can be considered. Digitization of back-issues of the Journal is in progress (http://www.hist-met.org/publications.html).

Meetings and Conferences

The Society holds at least three meetings per year: a residential Annual Conference (normally held over a weekend in September or October); a non-residential day meeting (normally held in May or June and combined with the administrative Annual General Meeting); and a Research in Progress meeting normally held on a weekday in November and aimed at research students and

others conducting active research within the subject. Other workshops and small meetings are arranged on an ad hoc basis, often on specialist topics. All of these meetings are normally held in the UK. The Society also welcomes opportunities for joint meetings, conferences, and study-trips with other like-minded organizations, both in the UK and overseas (http://www.histmet.org/meetings.html).

Grants

The Society offers grants toward costs of research, experimental work, and conference attendance within its subject-area. At the moment, these grants are for small sums, but the Society intends to increase its endowments in order to increase its grant-giving (http://www.hist-met.org/grants.html).

Conservation

The Society gives advice on, and lobbies for, the conservation of archaeological sites, historic monuments, artifacts, metallurgical collections and samples, and historical documents relevant to its subject, including company archives (http://www.hist-met.org/conservation.html). This activity has until recently centered on sites and monuments in the UK, but the focus is now moving toward artifact, sample, and documentary collections. *Metals and Metalworking*, the HMS Research Framework on Archaeometallurgy, is available as a free download from the Society's website (http://www.hist-met.org/specpubs.html), or by payment for the printed version; its detail is designed for the UK research and conservation situation, but much of the content is applicable more widely. A series of Datasheets, on specific topics, is available for free download on the website (http://www.hist-met.org/datasheets.html)

Resources

The Society holds a library of printed books, an archive of documents, etc. relating to its own activities plus the papers of Charles Blick and of Professor R.F. Tylecote, and reference collections of slags and metallurgical samples. It also manages the UK National Slag Collection held at Ironbridge Gorge Museum. It is intended to actively develop all of these collections, both for coverage and accessibility (http://www.hist-met.org/resources.html).

State of Knowledge and Current Debates

Introduction

Archaeometry can be broadly defined as the field where knowledge and analytical methods and techniques from natural and applied sciences enhance research carried out in archaeology and related disciplines, such as art history. In this context, an interdisciplinary approach is of crucial relevance for the entire research process. Close interaction between different specialists allows for systematic means of collecting, analyzing, and interpreting data to be applied and to shed light on archaeological questions about the life of past societies. Until the 1990s, most studies were focused on answering inquiries related to dating, exploration, artifact function and use, material sources, and manufacture methods. From then on, research topics, scale of analysis, and materials considered have expanded. Likewise, some analytical means became more complex, while new ones were incorporated. Thus, it was possible to achieve a more comprehensive and detailed understanding of social knowledge, behaviors, technologies, environments, and interactions between them, from ancient periods to recent times.

Today, the scope of archaeometry is pressing against ever-expanding frontiers. Investigations within the field of maritime archaeology have not been left out of this trend, as has been demonstrated by the increasing interest of scholars in adopting interdisciplinary approaches for the analysis of shipwrecks. Advances made on exploration and survey, identification of materials and manufacturing methods, dating, provenance, site formation processes, and treatments for the stabilization of remains are notable. A journal on archaeometric applications in maritime archaeology does not yet exist. But the growing quantity of studies that over the last years have incorporated analytical means to solve archaeological problems is currently reflected in many articles and book chapters, as well as meetings and courses, both of national and international scope. Furthermore, research news on these and other topics are published since 2014 in a special section of the *Newsletter of the Society for Archaeological Sciences* – known as the SAS Bulletin – titled "Maritime Archaeology."

This entry is not intended as a comprehensive review of archaeometric applications in maritime archaeology. Nor is it an exhaustive account on all the methods and analytical instrumentation available. Instead, it explores areas that have lately shown a notable advance regarding the means used for recording shipwrecks, characterizing wooden and metal remains, and preserving in situ and conserving sites and finds. The emphasis is placed on a selection of lines of research which deal with artifacts recovered from ca. fifteenth- to nineteenth-century wooden shipwrecks, especially those related with ship hulls, nautical equipment, and ordnance (Fig. 1).

Maritime and Nautical Archaeology

Maritime archaeology deals with the study of human activities associated with water scenarios (seas, rivers, and lakes), as well as with land operations related to them, through their surviving remains. The research in this field covers a broad spectrum of sites, including shipwrecks, harbors, dockyards, military batteries, and coastal settlements. Up to this point, noteworthy progress has been accomplished within the sphere of nautical archaeology. This particular situation is the outcome of both the predominance of shipwrecks around the world and the emphasis specialists have made on them in the specialty's history.

In this entry, attention is centered on sites from around AD 1450 onward, which are included in the research area known as historical maritime archaeology. This is the temporal framework widely accepted for historical archaeology and postmedieval archaeology, its closest relative in

Historical Shipwrecks, Archaeometry of, Fig. 1 View of the HMS *Victory* (1765 – in service) as an example of an eighteenth-century wooden warship. Note the cannons and the best bower and sheet anchor, located at the starboard side, artifacts commonly found in shipwrecks of the period. HM Naval Base, Portsmouth Historical Dockyard, Portsmouth. N. Ciarlo 2013

Europe. Nonetheless, challenging definitions based exclusively on temporal or methodological criteria, and in the light of recent discussions, it seems that these fields could be better characterized in terms of the diversity of new scenarios and social relationships (economical, political, and ideological) developed globally during the last centuries. In this regard, shipwrecks constitute an exceptional source of information for the study of the recent past, even when documentary sources (e.g., ships' logs, naval regulations, drawings, and paintings) and data from other archaeological remains are available.

Ships have been designed for specific tasks and environments, either the sea or other aquatic settings. As Maarleveld clearly posed: "ships contain in their construction one of the best clues to the mind of *homo faber* that the archaeologist can ever expect to find. The study of technical detail in shipbuilding (. . .) provides us with an exceptional opportunity to understand past thinking, concepts and decisions" (Maarleveld 1995: 4). Moreover, ships have an umbilical relationship with the mainland society: they are not isolated technological expressions nor navigate in a sociocultural vacuum. Watercraft is part of a sociocultural and environmental interweave, an expression of a complex array of factors, both material and nonmaterial, and therefore its study might improve our knowledge on nautical and other aspects related to the onboard and mainland societies. Authors such as Daniel J. Lenihan, Richard A. Gould, Jonathan Adams, and Colin Martin have addressed this theme. On the other hand, by articulating the wide range of documentary sources frequently available for the referred period, studies conducted on shipwrecks have contributed to a better understanding of modern society, in particular regarding military activities, commerce and exchange, extractive companies, and European colonialism (Flatman and Staniforth 2006).

Archaeometry on Historical Shipwrecks

Maritime archaeology is now acknowledged as a maturing field of global scope in which specialists are seeking to apply innovative approaches to explore scarcely developed areas. The need to integrate diverse scales of analysis, reflect on the theoretical foundations of the specialty, and foster the articulation of methods, techniques, and expertise from other disciplines has been stressed in the introduction of *The Oxford Handbook of Maritime Archaeology* (Catsambis et al. 2011: xiii). To broaden the scales of analysis, in particular, is a fruitful path for the development of investigations that go beyond approaches focused on single shipwrecks.

Within this trend, the case of archaeometry and its applications to historical shipwrecks can be highlighted. As was referred above, they have been useful for field-related activities, technological assessment of remains, interpretation of natural and cultural dynamics acting on site,

Historical Shipwrecks, Archaeometry of, Fig. 2 Scanning electron microscope QUANTA FEG 250 and image of the unaltered surface of a sheathing tack. (Courtesy of the National Institute of Industrial Technology (Argentina))

and stabilization and conservation of artifacts, among other aspects. The increasing quantity and diversity of archaeometric methods and techniques – some of which have improved and spread significantly in the new millennia – allowed researchers to achieve a better understanding of sites and specific research themes. Most analytical instrumentation was borrowed from the natural and applied sciences (for a summary of available means, please refer to the appendix on scientific analyses and dating techniques of the mentioned handbook) (Fig. 2). Several monographs on studies conducted at historical shipwrecks have incorporated special sections on archaeometric analyses since the 2000s (e.g., Grenier et al. 2007; Elkin et al. 2011; Satchell and Whitewright 2014; Nieto et al. 2016; see also specific works cited below).

Technological improvements have also opened new scenarios for archaeological research. At this point, a mention to geophysical techniques for acoustic and magnetometric underwater survey can be made. Together with unmanned underwater vehicles (UUVs), this area of research has shown outstanding development. An increasing number of maritime archaeologists use them, especially when wide areas need to be covered or deep-water sites accessed. James Delgado, from the US National Oceanic and Atmospheric Administration's (NOAA's) Office of Marine Sanctuaries, has directed interdisciplinary research on three nineteenth-century shipwrecks located 4,300 ft deep in the Gulf of Mexico (see papers presented at the *48th Annual Conference on Historical and Underwater Archaeology*, 6th to 11th January 2015, Seattle). Recent investigations carried out by archaeologists from the National Museum of Underwater Archaeology of Cartagena (ARQUA) on the 3,700 ft deep wreck *Nuestra Señora de las Mercedes* (1804), after the salvaging activities of commercial company Odyssey Marine Exploration, Inc., are also exemplar. They clearly show the importance of applying this kind of technologies with an adequate archaeological criterion, that is to say, aiming to answer archaeological questions (see fieldwork reports at: http://www.mecd.gob.es/mnarqua/).

A selection of significant accomplishments on the topics mentioned in the introduction is addressed in the next sections.

Site Survey and Recording with Multi-Image Photogrammetry

The new millennium saw profound transformations resulting from advances in digital technology. Within this context, the increasing number of tools available for the investigation of shipwrecks is remarkable. The constant improvements in data acquisition and processing systems have offered excellent results in terms of recording and analyzing the material remains of these sites. Photogrammetry deserves a special mention as an instrument for the study of ship hulls, the

morphological-functional analysis of finds, and the interpretation of site formation processes. Furthermore, visualizations and animations derived from this technique have an additional value, as a vehicle for the public dissemination and valorization of shipwrecks.

Undertaking a detailed documentation of the artifacts and structures from the sites under study is one of the fundamental aspects of the archaeological practice. Within maritime archaeology, the application of photogrammetric techniques to the study of shipwrecks dates back to the beginnings of the field, with George Bass's pioneering work. However, due to the operational costs and the technical knowledge required, its use remained relatively limited for several decades. The referred digital advances, especially in terms of software, brought about the introduction of multi-image photogrammetry (or Structure from Motion, SfM) at the beginning of this century. Currently, through software packages such as Agisoft PhotoScan®, it is possible to automatically process a set of numerous photographs to create dense point clouds, which can then be turned into meshes and texture models. Thanks to this new modality, photogrammetry is today a precise, fast, and economical method for surveying and recording shipwrecks (Yamafune et al. 2017).

The process of acquiring data by means of photographic coverage is essential. Precaution is needed before and during the registry, especially if a single conventional digital camera is used. McCarthy and Benjamin (2014) highlighted several aspects specifically related to the conditions of the underwater environment. To begin with, the camera must be calibrated to correct the geometrical distortions produced by the lens (radial distortion) and by the refraction of light in water. Also, to ensure the required vertical and horizontal overlap of images, one single point should be displayed in, at least, three different pictures. How the photographs are to be taken will also depend on the distance to the object, the surrounding visibility, the height of the remains above the sediment, and the presence of mobile elements such as plants and animals, among other factors. These variables must be considered for choosing an adequate camera and defining shooting settings (e.g., ISO, aperture, and shutter speed). The resulting images can be then processed to obtain orthophotos and 3D models. This and other works present some of the low-cost solutions currently available to obtain high-quality records of underwater sites.

Multi-image photogrammetry is especially suitable in both nonintrusive and excavation activities to quickly record complex artifacts and structures, which would demand a huge effort to draw manually. It holds additional value for deep water archaeological sites, where very little time is available to carry out the recording. In these cases, it is also possible to obtain images by means of remotely operated vehicles (ROVs). On the other hand, this technique is a reliable tool from which measures and planimetric drawings can be obtained. Green and Gainsford (2003) proved, through a series of comparative underwater tests, that the photogrammetric record (obtained with PhotoModeler) equals the accuracy of standard trilateration, although considerably faster and thus more efficiently. Given the advantages yielded by computer programs, it is even possible to build 3D reconstructions from raw images. In this regard, the work carried out by Bojakowski and his colleagues in the British shipwreck *Warwick* (1619) is notable. Using the photographic coverage taken during excavations at the site, originally collected to make a photomosaic, the authors assessed the accuracy of SfM against the results obtained by trilateration. Even though the latter is still indispensable, mainly in sites that possess numerous significant details, the former is an extremely useful complement (Bojakowski et al. 2015).

In practice, SfM has mostly been applied on Mediterranean shipwrecks, both to register structural remains and amphorae cargoes (see Drap et al. 2013, among others). However, its application within studies on modern and contemporary shipwrecks has gained ground in recent years. Recently, Yamafune and collaborators proposed a specific methodology for historical sites. Along with the presentation of a detailed procedure, they emphasized on the elaboration of 3D models and their importance both for the study of shipbuilding

design and construction and for the dissemination of archaeological sites to the public (Yamafune et al. 2017).

The high degree of detail provided by orthoimages and 3D models is helpful for the interpretation of sites. In the case of ship structural remains, these representations are a source of data permanently available to archaeologists – in this way they gain certain independence from the sites – when examining naval architecture. This is equally valid for isolated artifacts, such as anchors and cannons. Shipwrecks assessed in different parts of the world account for the relevance of this analytical tool (e.g., Mccarthy and Benjamin 2014; Bojakowski et al. 2015; Yamafune et al. 2017). Recent lines of work also include the generation of 3D models based on optical and acoustic sensors and underwater videos. Among current digital approaches to the study of shipwrecks, the recording, reconstruction, and analysis of recovered ship remains by 3D laser scanning, in particular the advances made within the Faro and Rhino Archaeological User Group (FRAUG) by Pat Tanner, Nigel Nayling, and colleagues, are worth mentioning (see also the 3D documentation of the hull of the Confederate submarine *H.L. Hunley*, 1864, made by Michael P. Scafuri).

A photogrammetry 3D model and an orthoimage of the Deltebre I site structure made using Agisoft PhotoScan® are displayed in Fig. 3. The remains studied by the Catalan Centre for Underwater Archaeology (Centre d'Arqueologia Subaquàtica de Catalunya – CASC), under the direction of Gustau Vivar, belong to a British naval transport which sailed during the Napoleonic wars and sunk at the Ebro river delta, off the Catalonia coast, in 1813. Since the beginning of the archaeological work in 2008 until its completion almost a decade later, a planimetric record of the excavated sectors was kept. This allowed verifying the structural deterioration suffered by several sectors of the hull, caused by the environment's erosion

Historical Shipwrecks, Archaeometry of, Fig. 3 (above) Photogrammetry 3D model and (below) orthoimage of the Deltebre I site hull structure, after completing the excavation works of the cargo (by Juan Mayoral Peñalva 2018). Remains correspond to the lower part of the hull: note the frames and inner planking, the keelson, and the well-preserved rudder (height: 9.5 m) that lies horizontally on the seabed. A few canons and mortar bomb storage in bulk still continue in situ afore the midship area. (Courtesy of the CASC)

and consequent exposure of the timbers on the seabed. This record was recently complemented with a photogrammetric registry, which required over 6,000 photos. Thus, it was possible to appreciate the complete remaining hull structure, a significant aspect given the visibility at the site (a mean of 5 m). Because of the aforementioned, multi-image photogrammetry is a fundamental recording tool for the regular monitoring of the state of preservation and future study of the remains.

Research conducted until now offers a glimpse of this technique's future. Because of its utility and considering the trends of recent years, it is likely that SfM will soon become an indispensable tool for the research and management of the maritime cultural heritage that lies underwater and in the intertidal zone. From now on, as Drap and others have recently highlighted, the main issue revolves around the possibility of adding "semantic to this survey and offering a dynamic link between geometry and knowledge" (Drap et al. 2013: 389). Archaeological interpretations derived from the data collected will depend to a large extent on this.

Materials Characterization and Lines of Research

Wood Anatomical and Dendrochronological Studies

Wood has been the main material used for naval construction until the introduction of iron and steel in the nineteenth century. Even if from that moment on the industry radically changed, this did not imply the abandonment of wooden shipbuilding, which continued to be performed in diverse contexts. During the age of sail, certain species were selected for the different structural components of a ship's hull, its masts and yards, elements of the nautical equipment, etc. Within each shipbuilding tradition, the choice of species was based on their properties, availability, and abundance in the natural environment, among other aspects. On the other hand, multiple artifacts used onboard by the crew were also manufactured from this material. The study of the wooden remains of a shipwreck, thus, is fundamental for the knowledge of the aspects mentioned above. Two branches of botany that contemplate the examination of wood and provide information of interest to deal with archaeological problems are referred here: plant anatomy and dendrochronology. The cases of study considered are mainly focused on the characterization of woody plant species used in naval construction.

Plant anatomy is devoted to the study of the internal structure of specimens: cells, tissues, and organs. This structure provides information for taxonomical analyses, including the identification of the samples' family, genus, and, to a lesser extent, species. The study requires the identification of diagnostic anatomical features, typical of each plant species, by comparing the sample with a reference collection and/or specialized bibliography (Caruso Fermé 2013).

On the other hand, dendrochronology deals with the history of trees through the analysis of their annual growth rings. Through time, the thickness of trees increases because of the action of tissues located underneath the bark that produce successive layers of xylem (i.e., wood). The growth of concentric layers, which mainly depends on the local annual seasonality, can be appreciated as rings in a transversal section. The main aim of dendrochronology is establishing master chronologies. In addition to contributing with the research of the diverse environmental factors which affected the growth process (e.g., precipitations, temperature, physicochemical characteristics of the soil, and other natural and anthropic phenomena), it is also used in archaeology to estimate the felling date of trees and their ulterior employment in, for example, naval construction. The absolute dating of a sample is obtained by comparing (cross dating) the individual series with a reference tree-ring sequence, unique for each species and region. The master chronologies are elaborated by matching characteristic patterns of annual growth rings, that is to say, those that preserve the climatic signature of a certain moment, observed in long-lived trees in specific geographical areas. To these, in turn, can be added the series obtained from ancient and archaeological wood. Thanks to an extensive work, sequences covering hundreds of years uninterruptedly exist for several regions of Europe. Moreover, provenance estimations can be carried

out thanks to the marked differences that the growth patterns of some species present at a regional level, as is the case of the European oak (Gutiérrez Merino 2009).

Adequate sampling is essential for the anatomical and dendrochronological analyses. In the first case, if the material is not carbonized, three different cuts are made with specific tools, corresponding to the anatomical planes of the wood: cross (transverse), radial, and tangential longitudinal sections. Different anatomical features can be obtained from each section. After the preparation of samples, anatomical and structural observations are made by optical stereomicroscopy (OSM), light microscopy (LM), and scanning electron microscopy (SEM) (Castro and Aldazabal 2007). In the second case, samples are taken with an increment borer or cutting transversal sections, depending on the situation, after which they are slowly dried and have their surface polished for the observation and measuring of rings (Mundo 2012). In practice, diverse factors can condition this kind of studies: the amount of wood available and its state of deterioration are generally determinant. As regards of anatomical analyses, the intraspecific variation and the physical similarities between species can difficult the identification (Caruso Fermé 2003). In dendrochronological studies, the number of rings is crucial, as it must allow recognizing the characteristic pattern produced by climate. The more the rings are preserved – ideally more than 80, although there is no general agreement – the more reliable the dating is. Occasionally, despite the disappearance of certain structures because of the original anthropic modifications and/or the decay suffered afterward (e.g., lack of sapwood or heartwood rings), it is still possible to make useful estimations (see Carrell 2003).

The anatomical analysis of timbers from a shipwreck is of special interest for studying the qualities of materials employed in construction. On some occasions, given the spatial distribution of certain species, it is possible to evaluate the provenance of the archaeological remains and, by extension, the approximate location of the shipyard. On the other hand, the importance of dendrochronological studies lies in the possibility of dating and assessing the provenance of the remains of a site. Because of the complementarity of both analyses, they are frequently applied together. For historical shipwrecks, the data obtained from these studies are evaluated together with the abundant documentation usually available on naval architecture, forest resource policies, nature and uses of timbers, etc. In particular, the anatomical analyses have provided useful information about ships' technology and life history. Noteworthy contributions have been made to the knowledge of the technical qualities of ship structures and equipment, different construction traditions, refitting operations, navigational routes, and regional and local logging practices (e.g., Carrell 2003; Castro and Aldazabal 2007; Rich et al. 2017). The taxonomical studies have also been applied on cordage elements and other organic artifacts used onboard.

Dendrochronological analyses have been employed to circumscribe the time and place of construction of historical shipwrecks (e.g., Grenier et al. 2007; Mundo 2012; Auer and Nayling 2014; Satchell and Whitewright 2014). The articulation of diverse sources of information and analytical techniques has provided significant results. The studies carried out in the Akko 1 site can be mentioned as an example. This shipwreck corresponds to an armed brig, most likely of Egyptian flag, which sunk during the naval siege of the city of Akko, Israel, by the British-Austrian-Ottoman fleet in 1840. The implementation of radiocarbon wiggle-matching (a combination of tree-ring analysis and radiocarbon data) of the ship timbers and the ^{14}C dating of short- or shorter-lived samples found in the shipwreck (e.g., cordage elements and food remains), together with other archaeological data, allowed to asses not only the time of construction but also to estimate the date of its last voyage and loss (Lorentzen et al. 2014). In the case of positively identified shipwrecks for which abundant historical records are available, the results obtained can help understand the age of the trees employed, the relation between the felling date and the time when the wood was used, as well as the reuse of old timbers. In the French shipwreck *La Belle* (1684), the dating of several structural pieces

suggested that timbers from older ships were reused for the construction of the hull (Carrell 2003).

Nowadays, many regions of the world still lack reference databases for dendrochronological studies. This has limited the investigations, particularly in areas that have been important supply centers for naval construction. The case of forest resources of the Iberian Peninsula used during the early modern period (sixteenth to eighteenth centuries) is of special significance. As Crespo-Solana and Nayling (2016) have recently noted in their presentation of the ForSEAdiscovery project (http://forseadiscovery.eu/), it is currently fundamental to develop long tree-ring chronologies in specific regions. By carrying out interdisciplinary work that combines documentary information and data from diverse means of analysis, it will be possible to generate databases that enable archaeologists to extend the application of dendrochronological studies in historical maritime archaeology.

Metallurgical Examination

The research of archaeological remains related to the extraction, production, circulation, and use of metallic objects is covered by a well-developed specialty: archaeometallurgy. It was originally comprised within archaeometry but soon became a field of knowledge in its own right. The investigations draw on specific means of analysis, as well as on historical sources such as written and oral records. Metallurgical analyses are significant for archaeological research in general and for shipwreck studies in particular. Metallic objects are ubiquitous in historical sites around the world. Among the most frequent finds in wooden shipwrecks are parts of the hull, to which different metallic elements are often associated, nautical equipment, ordnance, and other elements that were either part of the ship or carried onboard. For more recent times, ships with mixed construction and iron or steel hulls should also be considered.

Nowadays, a multiplicity of analytical methods and instrumentation is available to characterize the structure and composition of metal artifacts. The structural features of metals are observable at different magnitudes and include dislocations, grains, inclusions, twins, shrinkage cavities, and pores. Metallurgical examination usually involves analyses at more than one level and helps recognize, for instance, the heterogeneity of constitutive elements and the thermomechanical and corrosive processes that transformed a given object. Among available observation techniques, metallography has played a leading role in the characterization of archaeological remains. It consists in the examination of the microstructure of samples by LM and SEM, to determine the type and morphology of the material's microconstituents. The proportions, shapes, colors, and configuration in which these occur are related with the composition and properties of the material, and they are the enduring evidence of some of the transformations that it suffered (see Wayman 2004, among others). On the other hand, several chemical composition analyses can detect and quantify major and trace elements of the materials, for instance, energy dispersive X-ray spectroscopy (EDS), X-ray fluorescence (XRF), optical emission spectroscopy (OES), atomic absorption spectrometry (AAS), and neutron activation analysis (NAA).

These and other techniques have often been combined for studying metals from shipwrecks. They help recognize events in the life history of archaeological artifacts, from the acquisition and processing of raw materials to the manufacture, use, and deterioration in the depositional context. The main aim is to bridge the technical data and the social aspects that were, in one way or another, involved in their shaping. To begin with, the temporal and spatial coordinates of the remains under study can be narrowed down by the observation of the analytical results together with documentary sources and archaeological parallels. But archaeometallurgical studies also enable transcending the knowledge of single finds or isolated shipwrecks. If a comparative approach is applied, they can help answer questions about nautical technology at a given time. Studies can even go beyond this particular scenario and deal with matters such as knowledge of the behavior of materials, craft production techniques, innovations in industrial methods, experimentation processes,

and dynamics of technological transference. As was stated for other analyses, the explanatory potential of the data obtained always depends on the nature of the questions asked and the studies developed to answer them.

Metallurgical examination of objects from historical shipwrecks began to be carried out on a regular basis at the beginning of the 1980s. The main foundations were laid in Australia; over time, this approach was extensively applied in other countries such as Argentina, England, Israel, and Spain. To date, studies on wooden-hulled historical shipwrecks from the eighteenth and nineteenth centuries are the highest in number.

Important contributions have been made on sites for which abundant documentary information is available. Works have mainly dealt with nautical (e.g., hull fastenings and sheathing; anchors, pumps, and rigging components) and military (e.g., cannons, personal weapons, and ammunition) technology. In general, they address the function of the pieces, materials and production methods, and available metallurgical knowledge (e.g., Samuels 1992; MacLeod 1994; Macleod and Pitrun 1996; Mentovich et al. 2010; Ciarlo 2015). Leading scholars such as Dana Ashkenazi (Tel Aviv University), Manuel Bethencourt (University of Cadiz), Horacio De Rosa (University of Buenos Aires), and Peter Northover (University of Oxford) have also conducted extensive analyses on iron, copper, and copper-based artifacts. Investigations also provided information on the wrecking process itself: the analysis of the steel plates and wrought iron rivets from the RMS *Titanic* (1912) conducted by scientists of the University of Missouri-Rolla can be mentioned as an example (Felkins et al. 1998). In unidentified shipwrecks, the typological and physicochemical characterization of structural elements such as bolts, nails, and sheathing plates has been useful to appraise their date and provenance and thus contributed to an initial approach to the sites themselves (e.g., De Rosa et al. 2015). Most of these studies are based on the application of one or more of the techniques mentioned above, primarily metallography (Fig. 4). More recently, analyses of lead stable isotopes by multiple-collector inductively coupled plasma mass spectrometry (MC-ICP-MS) were used to determine the provenance of the raw materials of artifacts from the cargoes and ships' structure (e.g., Birch et al. 2014), and statistical tools such as multivariate analysis were introduced for interpreting compositional quantitative data of large samples (e.g., Ciarlo et al. 2016).

Objects used onboard have not been analyzed to the same extent. Research on the HMS *Swift* (1770) can be quoted: not only were its nautical components studied but also personal firearms, furniture, food and kitchen utensils, uniform accessories, and personal belongings. Data recovered from these remains helped understand both life on board and technology of the society of that moment. The studies on alloys and manufacturing processes of small items such as buttons, buckles, spoons, kettles, knobs, candlesticks, and coins were important contributions, as few technical descriptions are available in documentary sources (Ciarlo 2014).

Generally, contributions have hitherto been focused on the remains of isolated shipwrecks from European origin located around the world. Therefore, comparative studies must be explored better if broader questions are to be addressed. The author's dissertation on technological innovations and conflict of naval powers, which focuses on the applications of metallurgy to shipwrecks, is based on this approach (Ciarlo 2016). The work presents the characterization of an array of metal artifacts from mid-eighteenth- to early nineteenth-century British, French, and Spanish shipwrecks. Ships of different rates (as well as unrated) were considered, and specific analyses were performed on structural fastenings, sheathing, nautical equipment, and ordnance. Both the manufacturing methods and the characteristics of the materials were identified with different instrumental techniques. Those results and the information recovered from documentary sources and other well-studied archaeological sites were used to analyze changes in metal elements used in wooden warships. The dynamic of some innovation processes developed during the period were discussed in the light of the technical changes at the beginnings of industrialization, the

Historical Shipwrecks, Archaeometry of, Fig. 4 Rigging components recovered from the 74-cannon Spanish ship *Triunfante* (1795), Gulf of Roses: (**a**) triple sheave block; (**b**) single sheave block with an (now broken) iron hook; and (**c**) deadeye with an iron strap. A technological assessment of samples was carried out by means of metallography and other techniques. Photomicrographs indicate that one of the sheaves (**a**) was manufactured in a copper alloy by casting, while the hook and strap (**b** and **c**) were made in wrought iron by a hot-forging process (after Ciarlo 2016)

articulation of empirical and scientific knowledge, and the implications of states' conflicts on technology.

In regard to iron and steel ships, research conducted over 30 years on different sites in Australia should be mentioned, particularly the groundbreaking case of the *SS Xantho* (McCarthy 2009). Studies of these shipwrecks were mainly focused on the shipbuilding industry from the mid- to late nineteenth century and, within this context, the transition from sail to steam. Works carried out at local and regional scales helped understand the social and economic processes behind this change. Significant advances were made after Gould (2000) emphasized the need to explore this subject. Besides, archaeological surveys and recordings were performed on other underwater sites, such as steel-hulled ships, submarines, and other vehicles and machines from the Second World War. Archaeometallurgical analyses, however, are comparatively scarce. On the other hand, these wrecks have been of particular interest for corrosion specialists. They have studied the deterioration mechanisms of iron in maritime environments and, together with conservators, searched for the best treatments to preserve them (see below).

Archaeometallurgical research has contributed with nautical technology studies, including artifact production, shipbuilding, past technical and scientific knowledge, innovation processes, and performance of materials. The future of these studies seems to lie on the integration of information

from several shipwrecks. Works that follow this approach are recent but most promising.

Decaying Processes, In Situ Preservation and Conservation of Wooden and Metal Remains

Underwater archaeological remains can be preserved exceptionally under favorable conditions; this applies outstandingly to wood and other organic artifacts. This was acknowledged by archaeologists in the late nineteenth century. Nonetheless, a paradox in terms of conservation was also recognized early on: the integrity of these and other materials is severely altered when they are exposed and/or removed from their original context, especially if they are shifted from anaerobic to aerial conditions. Given the significance of cultural heritage and the need for long-term preservation, decisions and operations aiming to mitigate its deterioration must be applied from the very start. Within this scenario, several analytical means have been used to assess the state of preservation of the finds and thus decide the optimal way to protect them. Additionally, interdisciplinary researches have improved our understanding of the deterioration phenomena and their consequences and helped develop novel techniques for the in situ preservation and conservation of sites and finds. Due to their distinctive properties, wooden and metal artifacts are subject to different deterioration processes and therefore require special treatments.

The remains of wooden shipwrecks in seawater and other aquatic systems can lie either on the seabed (uncovered) or below the sediment (buried). In the former, remains can be affected by water erosion and wood-boring organisms. In the latter, although erosion bacteria degrade the cellulose and lignin of wood cells and decrease its strength, buried and waterlogged archaeological wood usually appears to be well-preserved to the naked eye. There are two main ways to handle wooden remains from underwater sites: (1) in situ preservation and (2) excavation, removal, and conservation in laboratory. Since the 1990s, a trend toward the first option has been observed: the works of David Gregory, Martijn Manders, Ian Oxley, and Vicki Richards, among other conservation scientists and archaeologists, are noteworthy. Concerning international standards, the 2001 UNESCO Convention for the Protection of the Underwater Cultural Heritage strongly promotes nonintrusive strategies for research and in situ preservation. It should be noted, however, that excavation continues to be an essential method for data recollection in archaeological research. As safeguarding this heritage for future generations is the main concern, archaeologists and conservators need to develop more effective and efficient methods for attaining this purpose (see Gregory et al. 2012).

If it is decided that a site must be protected in situ, which is desirable in most cases, the condition of the wood and the natural and cultural agents of deterioration should be noted in advance in order to correctly evaluate the decay potential. Besides, it is of great importance to periodically monitor the remains to ensure their long-term preservation. Macro- and microscopic examinations and chemical composition analyses of archaeological samples help understand the effects of degrading organisms (e.g., marine borers, soft rot fungi, and tunneling and erosion bacteria) in underwater sites. Studies on the decay rates of specimens placed in environments with specific oxygen levels, salinity, temperature, and other conditions constitute an important basis for the development of effective in situ preservation methods. For instance, while marine borers attack wooden remains exposed to salty water above the seabed, they are absent in near-anaerobic environments below the sediment, where erosion bacteria are the main cause of wood decay (Björdal 2012). As these agents can – and usually do – interact in a single site, their joint action and its consequences are an issue of special interest for future research.

In addition, the analysis of wood is a crucial step to determine its state of preservation and to decide the proper strategies for its raise, conservation, display, and storage. The evaluation of the degradation mechanisms and the consequences of exposing wood to aerobic conditions have received special attention. In the Baltic Sea and Scandinavian waters, timbers of several shipwrecks and their surrounding sediments were examined by means of different spectroscopic

methods and elemental analyses. Data recovered shed light on the decay process of wood deposited in a near-anaerobic substrate, where sulfate-reducing bacteria cause its degradation and chemical contamination. It was concluded that when timbers are raised and exposed to aerobic conditions, the sulfur and iron accumulated by these organisms can oxidize and acidify the wood and compromise their mechanical stability (Fors et al. 2012). Characterization techniques were also applied by Emma Hocker (The Vasa Museum) and other conservators to appraise the condition of timbers treated with polyethylene glycol (PEG) – a water-soluble agent that works by replacing water in the wood cells – that are contaminated with insoluble compounds of iron. Lessons learned from extensive conservation experiences on shipwrecks such as the Swedish warship *Vasa* (1628) can help to anticipate similar problems and face new challenges. Stabilization of recovered artifacts also created special challenges and depends on laboratory techniques that are highly environment-specific, for instance, the lyophilization process used with waterlogged organic remains.

Studies of the long-term corrosion behavior of metal artifacts are well developed. Extensive research was carried out on different remains from underwater sites, mainly iron and steel, by eminent specialists such as David Gregory, Ian MacLeod, Paul Mardikian, Jean-Bernard Memet, and David Watkinson. In Australia, the pioneering works of MacLeod with wooden and metal shipwrecks and associated iron finds such as cannons and anchors demonstrated the importance of on-site measurements of electrochemical parameters to understand corrosion mechanisms and the decay of materials in different environments (e.g., shallow vs. deeper waters). The effectiveness of treating the pieces in situ with sacrificial anodes was also assessed. Over the years, this author analyzed pre-disturbance pH values and corrosion potentials of cannons from the Cromwellian shipwreck at Duart Point (1653), the warship HMVS *Cerberus* (1926), and other sites of the period, before and during their in situ preservation. Measures taken since late 1980s have provided data on changes of the microenvironment underneath the concretion layer of each object. MacLeod then defined the arithmetic product of these parameters, named the Corrosion Indicator, as a valuable model that specialists can use to monitor the progress of a conservation treatment and determine the moment at which an object has been stabilized (MacLeod 2013). The microstructural examination of copper, bronze, and silver alloy artifacts recovered from seventeenth- to nineteenth-century sites has also expanded our knowledge on the long-term behavior of materials in seawater (e.g., MacLeod and Pitrun 1986). Archaeological remains that have been subjected to specific environmental conditions for centuries are also a useful source of information for other disciplines, such as materials science and engineering.

In the laboratory, some techniques such as X-ray radiography (XR) and computed tomography (CT) have been widely used to identify the morphology and appraise the integrity of ferrous and nonferrous artifacts before conservation, in particular for heavily concreted pieces. Data obtained is also helpful to evaluate marine iron remains extensively deteriorated, which thereupon can be replicated using cold-setting resins. Concretions associated to the remains of the Dutch vessel *Hoorn*, from the Jacob Le Maire and Willem Schouten' voyage, which sunk in the Deseado estuary, Santa Cruz, in 1615, were subjected to this replication process (Ciarlo 2006). As early as the 1960s, specialists from Australia, Britain, Scandinavia, and the USA began to experiment with different methods to remove encrustations and chloride ions from artifacts (see papers on the *International Journal of Nautical Archaeology* and *Studies in Conservation*, among others). Over the years, conservators and materials scientists developed novel techniques that improved the results obtained with conventional treatments, such as washing and electrolytic reduction systems, and are very useful for conserving and long-term managing of recovered archaeological materials (see ICOM-CC Metals Working Group online publications). For instance, Paul Mardikian, Nestor González-Pereyra, and colleagues from the Warren Lasch Conservation Center at the Clemson University Restoration Institute obtained significant results

from their experiments with subcritical and supercritical fluids for the stabilization of several artifacts from the *H.L. Hunley* (1864).

Understanding how a shipwreck was transformed due to natural and human impact over time is fundamental for the interpretation of archaeological evidence and the search for adequate solutions to mitigate threats and stabilize and monitor the remains. Investigations conducted at historical shipwrecks have mainly been focused on natural site formation processes, in particular on how natural agents affect the conservation and spatial distribution of materials in underwater and intertidal sites.

Systematic experimentation carried on underwater to test wood and metal samples is an interesting approach to assess the deterioration processes at a site. Archaeologists and biologists have centered in the identification and behavior of biofouling communities and wood-boring organisms. In Latin America, extensive work was carried out by Monica Grosso and Ricardo Bastida on the remains of the HMS *Swift*, 1770 (e.g., Bastida et al. 2004; see also Elkin et al. 2011). In Spain, a program to monitor the physicochemical and biological decay processes of materials commonly found in wooden shipwrecks was developed under the direction of Manuel Bethencourt. A series of test panels were located in shallow waters of the Gulf of Cadiz, both above and below the seabed (Fig. 5), and their response to different microenvironments followed closely (Bethencourt et al. 2017). On the other hand, stabilization trials with geotextile mats were conducted in the HMS *Colossus* (1798), Isles of Scilly, to evaluate the effectiveness of different existing methods for the in situ preservation of structural wooden remains. The characterization of timber test blocks by means of visual examination, XR, and SEM and the periodical monitoring of chemical and physical parameters (dissolved oxygen, Redox, temperature, and pressure) allowed specialists to determine how wood borers and microorganisms affected samples placed in dissimilar environmental conditions (Camidge 2009).

The analysis of the nature of sediments, current dynamics, wave conditions, and properties of water is also important. Here, interdisciplinary approaches based on the combination of data from geophysics, geomorphology, marine biology, and materials science, among other fields, have a special value in terms of theory and practice in shipwreck archaeology (e.g., for defining survey priority areas). In a recent work, field measurements and numerical modeling were developed to understand the articulation between scouring, geomorphologic changes, and hydrodynamic forcing at the shallow water wave-dominated *Fougueux* (1805) site, Gulf of Cadiz (Fernández-Montblanc et al. 2016).

In sum, archaeometric studies conducted at different sites have allowed archaeologists to obtain a better understanding of the conditions of wood and metal remains and their threats and

Historical Shipwrecks, Archaeometry of, Fig. 5 Test panels with different wood and metal samples, placed above the sediment in shallow waters at the Gulf of Cadiz. (Courtesy of M. Bethencourt)

decay rates. Results obtained so far are a solid foundation to improve the techniques applied to the in situ preservation and conservation of historical shipwrecks. Research advances achieved during the last years suggest that further improvements are likely to be developed before long.

Future Directions

Archaeometric studies stand as a valuable resource for the research of historical shipwrecks, one which should not be neglected. Studies conducted so far are a testimony of the increasing articulation of specific knowledge and theoretical-methodological approaches from different specialties belonging both to the natural and applied sciences. Concomitant efforts to overcome disciplinary trenches have allowed addressing subjects that could not be understood throughout from the optic of a unique field.

In this entry, just a fraction of the extensive contributions made up to this point was reviewed. However, I hope to have depicted the potential of bridging different yet complementary approaches within maritime and nautical archaeology. This have helped to locate and identify shipwrecks, examine their technology, establish the date and provenance of artifacts, elaborate 3D models of sites, and evaluate the integrity of the remains and the factors that affect them, among other aspects. In retrospective, investigations show that an increasing amount of analytical methods and instrumentation is being applied. Specifically, works that use digital techniques to record shipwrecks in situ and those that apply analytical means to investigate/inquire into wooden and metal remains experienced a remarkable growth since the beginning of the century. Less represented but with a promising future is the incorporation of statistical tools for processing compositional data of large samples, as well as numerical models for interpreting site formation processes. Other recent lines of archaeometric research in shipwrecks include DNA analysis and isotopic studies of human skeletal remains and chemical and petrographic characterization of ceramics shreds.

Comparative analyses provide an amazing opportunity for nautical studies. In the last years, researchers have explored the relationship between the material evidence at the sites under study – singular entities – and the large-scale context. They have thus considered both the distinctive aspects of social life and their articulation with extensive processes. Concerning shipwrecks, investigations have ranged from the study of the evidence from a single vessel to the analysis of several of a certain period or geographical area. Nowadays, diachronic archaeometric research accounts for multiple features that defined ships through time and contributes with the knowledge of dynamics in nautical technology and other social activities in local and regional maritime scenarios around the world. Available scientific devices stand as an important mean for conducting studies which, in the long run, could contribute to solving broad archaeological questions.

To accomplish it, it is crucial to keep an interdisciplinary approach throughout the entire research process, from the stages of planning and execution to the interpretation of results. It is widely acknowledged that obtaining data from available methods and techniques is not an end in itself. Even if they can be an exceptionally useful tool, the affirmations derived from their application are of little value without proper orientation. As I have sought to show in this essay, these resources are meaningful for maritime archaeology and archaeology in general, as long as specialists work jointly with the aim to achieve a comprehensive understanding of questions about the human past. In practice, the main challenge has been to bring together different spheres of knowledge, establish a fluid dialogue, and encourage mutual learning between specialists. Future advances will depend not solely on technical innovations but, primarily, on the improvement of interdisciplinary links.

Histories of the Archaeological Discipline: Issues to Consider

Alejandro F. Haber[1] and Amy Roberts[2]
[1]Escuela de Arqueología, Universidad Nacional de Catamarca & Consejo Nacional de Investigaciones Científicas y Técnicas, Catamarca, Argentina
[2]College of Humanities, Arts and Social Sciences, Flinders University, Adelaide, SA, Australia

Introduction

One could argue that archaeology is a discipline obsessed with its own history. It is as if the discipline, through studying the material remains of past human populations, feels that this is an obvious part of its mission. Indeed, textbooks, handbooks, regional syntheses, books on theory, and more will greet you with an archaeological history on the given topic within the first few pages.

Any general history of archaeology will tell you a version of how it was born, how it developed, and how it changed as new techniques or new theories or perspectives arose. In fact, archaeology and archaeologists cannot be disentangled from social and economic contexts or political orientations and institutions (see Harmansah and Shepherd 2012: 52). When one of these contexts changes so does the discipline by virtue of its reaction to these situations. As such, some archaeologists and theorists have become increasingly concerned with:

> . . .tracing the genealogies of the discipline in colonial modernity and reflecting on its powerfully political status in the postcolonial world (e.g. Hamilakis and Duke 2007; Liebman and Rizvi 2008) (Harmansah and Shepherd 2012: 52).

H

Key Issues

Political, Social, and Economic Considerations

The political, social, and economic interrelationships that link archaeologists and academic institutions with broader political contexts are particularly explored in this entry (as well as many other entries edited by Haber and Roberts in this encyclopedia – see Cross-References listed at the end of this entry). Indeed, it is argued that the ideological needs of political regimes have been shown to influence the development of certain archaeological interpretations in a number of cases.

Given the interrelationships outlined above, it can be argued that the narratives of the past produced by archaeologists can, therefore, be read as allegories of the narratives of power (of gender, race, class, etc.). In the majority of histories, archaeology is represented as changing over time according to either external influences or its own internal evolution (e.g., its techniques, theories, and institutions). However, the epistemic conditions of the discipline are often unexplored. Epistemic assumptions about the discipline are reinforced in the ways in which the discipline tells its own history. It is only by telling their own history that history-tellers reinforce their claims. Indeed, as Pocock (1998: 220) has remarked about historians:

> They may be unruly members, but still they are members, of the society and culture within which they write, and whose history they are as a rule in some sense writing. . . It follows that every political society tends to maintain and recount what may be termed an autocentric history, a history of itself so far as it has succeeded in maintaining itself. . ..

While Pocock frames this debate in relation to "political societies," we would argue that the sentiments are just as relevant to "disciplinary societies" such as the archaeological community. Likewise, just as Hamilakis (2012: 70) remarked in his recent paper, we should remember to heed Said's (1994) recommendations to continually reflect "on the dangers of professionalized scholarship, a scholarship that fails to interrogate the structures it is implicated in. . .."

Issues with Disciplinary Histories

Thus, in this entry, we attempt to consider a number of assumptions present in many narratives. For it can be stated that history produced by the history-tellers often reveals as much about the process of producing historical texts as it does about the discipline. For example, many narratives take for granted the idea of Western lineal time and thereby signify that certain philosophies and approaches are better suited than others for knowing the past. Although some accounts, such as Trigger's (1996: 40–41), point to alternative ideas:

> This assessment assumes that there is a past and, hence, that time, whether it is viewed as an attribute of the natural world or a form of perception embedded in the human brain, is invariably conceptualized as a linear, irreversible flow. This conclusion may be psychologically correct in the sense that, because of awareness of causality, everyone perceived time as they are experiencing it to be unidirectional. Yet it is known anthropologically that the imaging of time is culturally variable. . ..

We would argue that historical narratives about the discipline of archaeology should actually serve to highlight the often arbitrary relationships between the kind of knowledge we call archaeology and the ontological-epistemic assumptions on which it is based and which it sustains.

Thus, archaeologists and historians of the discipline should be the ones insisting that there are always exceptions to the primary stories told (after Pocock 1998: 229). By attempting to highlight such exceptions, researchers can at least try to avoid reinforcing typical assumptions (such as linearity), thereby revealing that histories are particular and contingent. Further, we would contend that the discipline now needs histories about the history-tellers so that the hegemonies inherent in past accounts may be illuminated. Areas where such hegemonic ideas have become general and pervasive should also be deconstructed and countered. Indeed, archaeology, like other Western traditions, cannot be separated from the habits of Western historiography. Thus, the history of history-tellers may also be a privileged and pervasive arena where ontological assumptions regarding history are reproduced.

The particular and contingent nature of disciplinary narratives becomes more apparent when regional meta-disciplinary accounts sit side by side – this can be more apparent in a compilation such as this encyclopedia which assembles histories written by scholars from around the globe and from different archaeological traditions and social, economic, and political persuasions. Such a collection is not, however, without complications as further explored below.

Grappling with Multiple Frameworks

It could be argued that a global encyclopedia, such as this volume, represents the attempt to grapple with the perhaps impossible task of presenting a comprehensive examination of multiple frameworks – primarily through the introduction of numerous international perspectives. However, there is the potential to over-estimate the results of this globalizing exercise and thereby introduce a systematic deformation.

In fact, it should be noted that many narratives profess a global standpoint, although in reality they may be quite insular in their own frameworks. In this sense, Trigger (1984) began the process of addressing these issues in his insightful and much-debated paper entitled "Alternative archaeologies: nationalist, colonialist, imperialist." He concluded that archaeology is "strongly influenced by the position that the countries and regions in which it is practiced occupy within the

modern world-system" (Trigger 1984: 355). He also rightly criticized Clarke's (1979: 154) belief that there should be a "single coherent empirical discipline of archaeology." Thus, taking into account the many corners of the world in which archaeology is now practiced and also given that many researchers who write archaeological histories are not necessarily reflective about the influences (social, political, economic etc.) on all aspects of their work a comprehensive examination of multiple frameworks will undoubtedly always be an impossibility.

It should also be acknowledged that there is disagreement about how much influence political (and other) forces have on the discipline. Indeed, since Trigger's influential paper, there has clearly been much debate on this topic with some researchers ultimately arguing that nationalism is at the very heart of some archaeologies (e.g., European and the so-called third world) with others taking a middle road – these discussions are apparent in the quote below:

> Yet it is going too far to claim that nationalism was embedded in the very concept of archaeology and was the only cause of its development (Díaz-Andreu and Champion 1996: 3) or that nationalism cannot do without archaeology (Slapšak and Novaković 1996: 290). . .. (Trigger 1996: 248–249)

Thus, the degree to which researchers should reflect on the external forces involved in the creation of archaeological histories is also a contested ground, further complicating the task of understanding multiple frameworks. We would also argue that there is still some way to go in relation to understanding how the debates about ideas such as nationalism have progressed. It has seemingly become popular to condemn nationalistic tendencies in "third world countries," for example, with little reflection on the purported universality from which the critique arises or the potential imperialistic underpinnings of such condemnations. As Trigger (1984: 363) noted nearly 30 years ago, we must not lose sight of the hegemonic ways in which some nations may exert their powerful cultural, political, and economic influences over neighboring countries.

It should also not be forgotten that archaeology is also a territorialized practice. As Hamilakis (2012: 71) has commented, "As in all colonial ideologies, the neo-colonialism or perhaps the crypto-colonialism of certain strands of archaeological and museographic thinking today enacts simultaneously strategies of territorialisation and temporalisation: sustained engagement with certain locales can be linked to primordialist ties and essentialist claims, nationalist or other, on the part of the scholar; but it may also be indicative of a long-term commitment to a place and all its people, past and present, things and objects, sentient and non-sentient beings that belong to that place."

Identifying Silences

When considering archaeological histories, we should not only be concerned with understanding multiple frameworks and contested understandings but also be cognizant of the fact that current interpretations will be bounded.

The history of archaeology, like any disciplinary history, is also an important mechanism for the demarcation of its boundaries. We can scrutinize such histories by considering the areas that they exclude. In this case, such exclusion may operate in the manner as outlined by Fabian (1983) in his discussion about anthropology which he described as a denegation of coevalness.

Ways of relating to objects and beings that are considered different in approach to an institutionalized archaeological discipline are often narrated as "pre-disciplinary" in archaeological histories. Indeed, archaeologies other-to-the-discipline are described as not only as nonscientific but also as prescientific, as if they were superseded by the arrival of the discipline. As Byrne (1995: 278) writes, "multiple and mature discourses on the material past already exist in the space archaeology depicts as a void." Thus, the archaeological discipline, being positioned on the same timeline as discarded versions, both excludes its other and confirms its own epistemic assumptions regarding time.

Conclusions: A Polyphony of Partial and Contingent Voices and an Infinity of Alternative Histories

We would argue that the edited entries relating to the history of archaeology (see Cross-References

below) do not represent a thorough global coverage. Instead, we would contend that this selection is rather a polyphony of voices, all of them partial and all of them contingent. It should also be noted that most of the voices in these entries originate from within the discipline.

Thus, we encourage readers to consider imagining an infinity of histories of archaeology that could be written or compiled as an alternative to this volume – and to think about all that remains to be written. For example, we pose the question: How would those outside of the disciplinary context view and write such histories?

Such a history of archaeology could detail encounters with archaeology, with its texts, its actions in the field, its works for the public, and its monuments. These encounters would not assume a position already inside the discipline and could include displacements and subjective transformations. In such a history of archaeology, events will not happen within a thing called "archaeology," but things would happen to archaeology-as-a-thing. As Haber (2012: 64) has remarked, the task of undisciplining archaeology "has to be done in conversation, not merely with other colleagues, already participants of the same disciplinary faith, but with non-academic actors and collectives" and that through these intercultural relationships with the hegemonic episteme a political and poetical job of critical theorizing might take place.

Brief Definition of the Topic

Today, the excavation of medieval and post-medieval sites is a major part of the work of archaeological heritage agencies. Medieval contexts and finds have been analyzed critically and comprehensively, after an initial period in which they were discussed uncritically and in isolation. In German-speaking Europe, however, there is no real methodological or theoretical forum for post-medieval themes. This gap should be filled by the online journal *Historische Archäologie*. The journal aims explicitly to present research and analysis from the late medieval period and the modern period up to contemporary history in all its aspects. Its time frame ranges from the fourteenth/fifteenth century CE until today.

"Historical archaeology" is a term used differently by the various different archaeological traditions found worldwide, but all definitions and uses have in common an emphasis on periods with so-called dense tradition. This generally means that the archaeological material sources are accompanied by written and visual records and perhaps by oral history. The availability of such a density and diversity of sources offers greater potential for an emic and internal view of the culture being studied than is possible for "prehistoric" societies; this is an aspect which this entry intends to emphasize.

With this entry, a bridge should be built to other parts of Europe and other regions in the world, regions that in the early modern and later periods were by no means border areas and peripheries but instead saw cultural developments and independent phenomena, which have been increasingly appreciated in archaeology since the 1990s. This entry aims to offer young scientists and "established" colleagues the opportunity to present their research, in the form of well-founded, methodologically or theoretically oriented papers, which are likely be discussed in professional circles, rather than data-heavy field reports. All types of sources (archaeological, documentary, visual, and oral) should be incorporated, analyzed, and evaluated in a complementary fashion to answer the questions asked. This is the only way comprehensive cultural scientific and historic conclusions can be reached. It is repeatedly said with regret in archaeology that there is hardly any professional interchange between English- and German-speaking colleagues due to the language barrier. To address this, *Historische Archäologie* hopes to publish many articles in English or at the very least with a detailed English summary. Only in this way will international attention be drawn to research from the German-language area and take part in international discussion.

The journal was founded in 2009 and publishes articles in no particular order. The submitted

manuscripts are reviewed by an editorial board. At the time of writing, the editors are Dr. Natascha Mehler; Deutsches Schiffahrtsmuseum Bremerhaven; Prof. Dr. Claudia Theune, University of Vienna; and Prof. Dr. Ulrich Müller, University of Kiel.

History and Archaeology: Relationship Over Time (US Perspective)

Charles E. Orser Jr.
Department of Anthropology, New York State Museum, Albany, NY, USA

Introduction

Anglo-American archaeology, like all archaeology, has always been about history (i.e., the past). Nonetheless, the relationship between archaeology and history, as disciplines, has not always been consistent. The views of archaeologists and historians toward one another's fields have changed over time as new ideas and approaches have come into prominence. As a result, any brief overview such as this must be limited in scope, touching on only a few of the more salient points.

Any exploration into the nature of the relationship between archaeology and history must begin with the explanation that "history" has two distinct meanings. In one sense, "history" represents what has actually happened in the past; it refers to the trillions of events that have occurred since the beginning of time. The renowned Italian historian Benedetto Croce (1921: 125) uses the phrase "the actuality of living history" (or past actuality) to refer to this meaning of history. All scholars acknowledge that human history is made by people going about their daily lives – building institutions, attending school, harvesting, sleeping, and performing millions of other activities throughout their lifetimes. In this sense, history is simply everything that has occurred before "now." This history – the real past – being gone forever, remains today as images in living memory or physical representations, such as standing structures and textual records.

Accepting that the past actually existed but appears in the present as images or reflections means that scholars disagree on precisely how history should be understood and interpreted. None of us today can observe the actions of past individuals. The second sense of "history" is thus much more contentious. Croce (1921: 19) terms the writing of history "chronicle" or history "recorded in abstract words." A chronicle is a written history reconstructed from images taken from the vast sweep of past actuality. Contention among scholars occurs because, as the American historian Carl Becker (1955) argues, any written history is necessarily selective; archaeologists and historians can only include a finite number of historical facts in their accounts. Recounting all of human history would take as long as human history itself. The result is that archaeologists, like historians, must select "historical facts" from past actuality to create images of history. This conclusion does not mean that archaeologists and historians are permitted to write fantasies because their professional responsibilities require them to be as honest and accurate as possible. Just how this is to be accomplished, however, has encouraged archaeologists and historians to ponder, discuss,

and debate the meaning of history and the relevance of the past to contemporary life. Shifting views about who writes history, the relevance of the intended audience, and an account's long-term impact mean that controversies over the relationship between archaeology and history will continue to occur as long as both disciplines exist. Contention is not necessarily detrimental because the overt engagement with difficult issues forces scholars to reflect on their professions' meanings and societal responsibilities.

Becker's understanding of historical fact selection is especially pertinent to the practice of archaeology because the act of excavation overtly involves sampling. No matter how careful an archaeologist may wish to be in the field, he or she can never perfectly collect all possible information. The minute spatial relationships between all other artifacts (even those not excavated), the precise angles of artifacts in the earth, and the number of grains of sand brushed from an artifact's surface constitute facts that may be lost forever. Thus, all archaeological research, even the most overtly scientific in design and implementation, involves some measure of selection.

Definition

A dividing line between archaeologists and historians is difficult to draw with clarity. During the 1960s, many scholars debated the differences between the two disciplines, but in the end decided that the actual differences were quite negligible (e.g., Hughes 1960). Both professions concern themselves with many of the same topics, and many often use the same sources of information. It would be too facile to state that archaeologists excavate sites and historians interpret documents because some historians excavate and most archaeologists examine written records. American archaeologists differ from most historians by virtue of the archaeologists' formal training in anthropology, but even this distinction is too simple because English archaeologists and social historians regularly rely on anthropological perspectives and concepts. It can be reasonably observed, however, that archaeologists and historians have different disciplinary traditions and histories even though their work with the past is similar. Self-identification as belonging to one discipline or another thus may be something of a personal matter based on one's disciplinary home or research approach.

The tension that sometimes exists between archaeology and history may occur because archaeological excavation can refute long-held historical understandings that have been based on written accounts alone. At the same time, excavation can cast light upon subjects little studied by historians and can change the ways we perceive the past. Many historians have recently begun to use more anthropological methods and materials in their research, and many archaeologists have learned to give more weight to the historians' methods. The willingness to bring the two disciplines closer together has had many positive outcomes, even though the practice of archaeology and history continues to exhibit a healthy tension that serves to improve both fields of inquiry. Perhaps the most obvious link between archaeology and history occurs in historical archaeology, a subfield of archaeology that explicitly combines archaeological research with historical materials and interpretation. Nonetheless, all archaeologists regardless of area of interest use history to create narratives about the past.

Historical Background

The history of the relationship between archaeology and history is difficult to characterize with ease because of the variety of opinions. The first archaeologists who excavated the ancient cities of Greece, Italy, and Egypt viewed themselves as engaged in historical research (e.g., Stiebing 1993; Dyson 2006). They adopted a crude evolutionary framework – sometimes only tacitly – that tended to envision broad-scale cultural change along a trajectory that extends from simple to complex. The acceptance of broad-scale cultural evolution was certainly prevalent after 1859 when Darwin published *The Origin of Species*, and this outlook on human history was partly responsible for creating professional archaeology (Willey and

Sabloff 1993: 86). The cultural evolution paradigm holds that human history has changed over time from incorporating relatively simple elements (such as hunting and collecting) to developing extremely complex institutions (such as industrialism). Of course, as archaeologists and historians began to investigate the realities of cultural evolution in actual settings, they began to question the precise ways in which it operated both locally and globally, and today's understanding of cultural evolution is much more nuanced than was possible in the late nineteenth century.

V. Gordon Childe, an Australian-born British archaeologist of international repute, was arguably the most well-read archaeologist to espouse an explicit cultural evolution and to work as an archaeologist-historian. He observes in his book *History* that "It should be the historian's business to disclose an order in the process of human history" (Childe 1947: 5). A committed proponent of Marx's historical materialism, Childe believed that human history had progressed through a series of distinct stages and that culture advanced when revolutions in the economic base caused broad-scale social changes in other institutions. For example, when people learned to feed themselves with sedentary horticulture rather than with nomadic hunting, they had time to develop writing, to devise different family structures, and to build cities (and thus create "civilization"). Childe's views on history were widely accepted for many years, partly because having a broad view, he was intimately familiar with little-known museum collections throughout Western and Central Europe and the Near East.

Not every Anglo-American archaeologist accepted Childe's views in their entirety, especially not in the United States where the Cold War era fostered a strong disinclination for all things that appeared Marxist in influence, even archaeological theory. Still, most archaeologists generally accepted the idea of broad cultural change over time, even though they may not have agreed with precisely how to model and interpret it. One problem with the approach is that it has been used outside archaeology to promote and reinforce social Darwinist claims about cultural superiority and inferiority.

One Anglo-American archaeologist who did not wholly ascribe to Childe's evolutionary view was the British scholar R.G. Collingwood. Collingwood, a professor of Metaphysical Philosophy at Oxford University, had performed archaeological research on Roman sites in Great Britain. His book *The Idea of History* (1946) appeared 1 year before Childe's book. Collingwood (1939: 133), who like Childe moved easily between the worlds of the archaeologist and the historian, defined archaeology as "history in which the sources used are "unwritten" sources, or, more accurately, are not pre-existing narratives of the events into which the historian is inquiring." In other words, archaeologists write history for those times that lack textual documentation, whereas historians write history with extant records.

Collingwood (1946: 213) focused one of his historical interests on "the outside and the inside" of events. By "outside," he meant past action or the movement of actual physical things in the past – Caesar's crossing of the Rubicon, the blood spilled at the assassination of Abraham Lincoln, and the course taken by Napoleon's army toward Waterloo. But the "inside" of an event could only be described in terms of thought: the ideas behind the events. For him, then, the ideas of history provide the key to understanding. His view offered an important refocusing of archaeological thought away from the strict materiality of artifacts as expressions of art or even as metaphors for technologically driven cultural evolution.

In the early 1940s, when British archaeologists Childe and Collingwood were pondering the relationship between archaeology and history, an American archaeologist named Walter Taylor was contemplating the same issues for his doctoral thesis. Taylor finished his thesis in 1943, reworked it after the Second World War, and published it for the first time in the *American Anthropologist* as a memoir in 1948. Since that time, his *A Study of Archaeology* has been republished and widely read.

Taylor wrote the study as a critique of the practice of Americanist archaeology in light of the historical perspective prominent in American

anthropology. Unlike English anthropology, American anthropology had been founded to investigate the precontact expressions of Native American life, in other words, all those elements of Indigenous life in North America that were beyond the reach of field ethnographers. The overall goal of early American anthropology – of which archaeology was perceived as an integral element – was based on the mistaken concept that Native American cultures were rapidly disappearing and so evidence of them needed to be saved for posterity. Given this mandate, the role of American archaeology during what has been termed the "Classificatory-Historical Period" (1914–1960) was to collect and describe ancient Native American artifacts and settlements (Willey and Sabloff 1993: 96–213).

Taylor's goal was to delve into the nature of archaeology, history, and anthropology and to determine how the three were interlinked. His controversial conclusion was that archaeology is "neither history nor anthropology" but is an "autonomous discipline" that is essentially a method of data collection (Taylor 1948: 44). He viewed carefully controlled, scientific excavation as merely a tool for gathering information. What divided archaeologists – as anthropologists or historians – was based on the way each individual used archaeological information. Taylor (1948: 32) explained how this worked using five steps. The first step concerns problem definition or what was to be studied and how; the second step involves collecting empirical information using a particular method, such as archaeological excavation; and the third step is characterized by developing the chronological sequence using the empirical information. For archaeology, this step could be characterized by dividing potsherds into time periods based on their physical characteristics. Taylor's analysis suggested that many archaeologists ceased their research at the third step without considering the fourth step, historical reconstruction. Many American archaeologists had joined their colleagues in the other "historical disciplines" (geology, astronomy, cultural anthropology, and history) and moved more toward historical reconstruction, but for Taylor, this step was not enough. Where the three disciplines actually separated, he thought, was at a fifth level focused on "the study of the nature of culture" (Taylor 1948: 38). This highest level of analysis, originally envisioned by Franz Boas, the founder of American anthropology, led to the development of processual archaeology in the 1960s because one of its goals was the discovery of general laws of cultural process.

Vestiges of the views of Childe, Collingwood, and Taylor remain in contemporary archaeology, but it would be unfair to suggest that any of their perspectives are followed without significant modification. For example, many of today's archaeologists who ascribe to a Marxian view of history have delved deeper into Marx's thought than was possible in Childe's time because of the greater availability today of more published sources. Radiocarbon dating also has undermined many of Childe's cultural chronologies. Today's archaeologists no longer perceive their research as limited to nonliterate societies as Collingwood believed, and archaeologists interested in recovering mind have been able to rely on today's sophisticated comprehension of the interactions between psychology, action, and material things. Taylor's understandings of the relationship between archaeology and history had a major impact on the development of late twentieth-century archaeology – and, like Collingwood, he was interested in recovering mind – but much of his work reflects the scholarship of the 1940s. One important offshoot of Taylor's perspective is that he legitimized historical archaeology by refusing to construct temporal boundaries around archaeological research.

Key Issues/Current Debates

The key issues and current debates that surround the relationship between archaeology and history often concern the scale at which archaeologists should attempt to write history, topics that Childe, Collingwood, and Taylor each tacitly considered. The key question is: Should the focus be purely on one or two archaeological sites, with the goal of attempting to understand all their facets before thinking in extra-site terms? Some archaeologists

argue that their profession's biggest contribution comes from working at the site level, where they can intensively examine one household, village, or settlement. Historians have termed these studies "microhistories."

Other archaeologists propose that detailed research conducted at a single site can be built upon in increasingly larger scales to inform our perspectives about world history. Issues of historical scale remain one of the most prominent controversies in contemporary archaeology.

Many Anglo-American archaeologists learned about the importance of historical scales from the work of French historian Fernand Braudel. Braudel studied history as a member of the French *Annales* school, a perspective on history named for the journal *Annales d'histoire économique et sociale* created in 1929. The general goal of the school is to provide analyses of social and economic history, while also including information about geography and human thought processes. Thus, Braudel's perspective, which reveals themes addressed by both Childe and Collingwood, demonstrates how scholarly research on the relationship between archaeology and history accrues over time.

The potential of the *Annales* school was most clearly presented by Braudel (1972) in his sweeping history of the Mediterranean, originally published in French in 1949 but only appearing in English in 1972. Archaeologists were intrigued by Braudel's use of three levels of historical time: the event (short-term history), *conjuncture* (processes being enacted from around 10 to 50 years), and structure (long-term history), more commonly termed the *longue dureé*. The archaeologists' interest stemmed from three elements of Braudel's approach: his interest in historical process (as Taylor-influenced processual archaeology was the major paradigm at the time), his investigation of specific events (which could be likened to an individual archaeological site), and his concern with long-term history. Braudel (1980: 29) explicitly understood that archaeology is especially well suited to study history over the long term. He sought to capture the rhythm of life in these different scales and to construct histories of large structures and huge processes over long periods of time. One of the criticisms of Braudel's approach, however, is that he tended to focus too strongly on the *longue dureé*, thus overlooking the local and the particular. Still, the concept of the *longue dureé* has entered the lexicon of most practicing archaeologists and is viewed as an especially rich area of investigation.

As noted above, some Anglo-American archaeologists are committed to microhistory. Microhistorians tend to focus on the minute and the local and seek to present images of past daily life in intimate detail through the close examination of a few especially enlightening documents. Often termed "cultural microhistory" to indicate its affinity to anthropological approaches, the authors of such studies seek to use the experiences and events in the lives of one or two people as a metaphor for the sociocultural environment of a single society at a particular point in history. In one of the most famous microhistories, Italian historian Carlo Ginzburg (1980) charts the life of an obscure sixteenth-century miller, Domenico Scandella – called Menocchio – who was burned at the stake for opposing official Church doctrine. Ginzburg's account provides rich detail on life in a small early modern European town and in the process illustrates how larger forces, such as religious intolerance, affected the lives of ordinary people. Ginzburg (1980: xvii) also argues that microhistories illustrate the "circular, reciprocal influence between the cultures of subordinate and ruling classes," a goal that is consistent with Braudel's perspective.

Significantly, Ginzburg (1980: xv) fully appreciates the value of archaeological information in microhistorical research: "Since historians are unable to converse with the peasants of the sixteenth century (and, in any case, there is no guarantee that they would understand them), they must depend almost entirely on written sources (and possibly archaeological evidence)." This statement perfectly agrees with much research in contemporary historical archaeology because of this field's inherent interest in men, women, and children who were not in the upper echelons of

society – Ginzburg's "subordinate classes" – and so were frequently ignored in the accounts of "official" history. Archaeology is especially well suited to investigating the everyday lives of ordinary people and in this regard is similar to "bottom-up history" (Ginzburg and Poni 1991), "grassroots history" (Hobsbawm 1985), and "the history of the common people" (Lüdtke 1995). Archaeology directed toward the world's largely undocumented, so-called "inarticulate" classes has significantly enhanced our appreciation of history's majority. Such research has been instrumental, for example, in providing unwritten information about numerous facets of everyday life extending from subsistence habits to spiritual practices of enslaved men, women, and children of African heritage in the Americas. Equally invaluable insights have come from the archaeological study of sites associated with Chinese and Irish laborers living and toiling outside their home countries.

Another trend in the writing of history is world-systems analysis, largely created by Immanuel Wallerstein (2004). World-systems analysis appeared in the 1970s as an overt way to examine the broad trends of the world's interconnections since about 1500 CE. Strongly influenced by Braudel, Wallerstein attempts to demonstrate how large-scale analysis can reveal the presence of interlinked "world-systems" or webs of interaction that existed within "a spatial/temporal zone which cuts across many political and cultural units" and which "represents an integrated zone of activity and institutions which obey certain systemic rules" (Wallerstein 2004: 17). One feature of world-systems analysis is the interconnections between a core and its peripheries or between a dominant, powerful administrative center and its distant dependencies.

Many archaeologists, particularly those engaged with the archaeology of the post-1500 CE world, immediately found merit in world-systems analysis because of its systemic perspective and its overt plan to link distant places together into a single network of interaction. Using world-systems analysis, archaeologists could forge clear connections between seventeenth-century Spain as core and post-colonial Central American native cultural settlements as peripheries. In addition, Wallerstein's interest in the movement of commodities – the archaeologists' artifacts – gave world-systems analysis immediate archaeological relevance. Some archaeologists, thinking that Wallerstein's ideas might be widely applicable to all history, sought to apply his concepts to pre-Columbian history. This usage remains controversial because Wallerstein presented his ideas for the investigation of the world after the rise of capitalism – which he termed "the capitalist world economy" – not for ancient times. As with other ideas, Wallerstein's views have been critiqued and refuted by some and expanded and refined by others.

An important current debate in archaeological practice concerns differences between Ginzburg's microhistorical approach and Wallerstein's world-systems analysis. What is the "proper" scale for archaeological research? Many archaeologists have expressed their interest in microhistory by specifically focusing on the household or even sub-household scales. Much of this research has the anthropological goal of building "thick processual understandings that transport the reader into the rich context of some previous place" (Paynter 2005: 404). This level of analysis is based on the idea that the small and seemingly insignificant things with which people surround themselves help to define, manipulate, and signal who they are. Archaeologists inherently find this scale interesting because it provides a contextual comprehension of history in intimate detail. Archaeological research focused on single sites at first may appear to run counter to modern-world analysis because the latter seeks to interpret extra-site interactions and connections in broad geographical space. To the contrary, however, even modern-world analysis begins with the household. The broader perspective, once termed the "international comparative approach" (Deetz 1991), has been reformulated more rigorously as modern-world archaeology (Orser 2004). Modern-world archaeology is focused specifically on the post-1500 CE world and explicitly employs

ideas and concepts from Braudel, Ginzburg, Wallerstein, and even Collingwood to some extent. Modern-world archaeology relies on the careful interpretation of individual archaeological sites and seeks to present analyses at several historically relevant scales that begin at the household and terminate in the world at large.

International Perspectives

The use of works by Braudel (French) and Ginzburg (Italian) by Anglo-American archaeologists shows that an international perspective has been integral to their conception of the relationship between archaeology and history. In a practical sense, some of the archaeologists' appreciation of such works has been hampered by the lag between initial publication in the original language and translation into English. The lag time can be considerable, as in the case of much of Braudel's work. Many Anglo-American archaeologists, of course, speak or at least read a language other than English and so are unaffected by the language barrier. Even so, an additional, practical factor that can add to Anglo-American provincialism is the often-limited distribution of non-English journals and books. A number of professional journals – both in print and online – have substantially improved every scholar's access to the works of non-English-speaking scholars. The general archaeological perspective is thus in the process becoming truly internationalized.

Future Directions

Archaeologists of all interests and areas of expertise will undoubtedly continue to ponder the relationship between archaeology and history. The intellectual exchange between archaeologists and historians is likely to continue, with practitioners of both disciplines borrowing perspectives and approaches as practicable. Archaeologists will likely continue to explore ways to investigate the various scales of analysis and will undoubtedly provide significant contributions along the way. One of the topics likely to be pursued in the future is a more intense examination of the different scales of analysis. The globalization of archaeology, increasingly conducted outside the Anglo-American world by Indigenous scholars, will provide new insights to old problems, such as the creation of archaeological linkages between the local site and the rest of the world. The spread of commoditized artifacts – as part of the globalization process – remains fertile research territory for archaeologists interested in local–global connections, and increasing numbers of archaeologists are likely to conduct this research in the future.

Increasing academic specialization is one obstacle that must be overcome, however. Unlike in the early-mid-twentieth century when Childe, Collingwood, and Taylor were writing, today's often-confining academic specialization has not always improved the frequency of collaboration between archaeologists and historians, even as the rise of the Internet has made communication easier and faster. The Internet has the power to defeat professional provincialism because of the sheer volume of information now available. At the same time, the explosion of research around the world may actually encourage increased specialization. The electronic availability of materials once difficult to obtain has meant that scholars now have a much more difficult time staying current with their own field of expertise. Reading widely in related disciplines is today more difficult than in the past, and the explosion of information tends to restrict the broad overviews that scholars like Childe once produced. Even with the Internet, archaeologists and historians who are investigating the same subjects may be unaware of one another's research or, if they are aware of their similar topics, may not readily perceive the benefits of disciplinary cross-pollination because of narrow specialization. Increased specialization thus may have had the unintended consequence of diminishing interaction between scholars in different albeit related fields like archaeology and history. With time, archaeologists and historians will hopefully find more common ground and create innovative ways to interact and collaborate.

History and Current Debates of Archaeology in Island Southeast Asia

Hsiao-chun Hung
Department of Archaeology and Natural History, The Australian National University, Canberra, ACT, Australia

Introduction

Island Southeast Asia (ISEA), situated between Mainland China, Mainland Southeast Asia (MSEA), and Oceania, has been among the world's most significant passageways of human migrations since more than one million years ago (1 Ma). Hominids such as *Homo erectus* lived in Java at least as early as 1.2 to 0.8 Ma. The high diversity of landscape, population, and culture in ISEA makes it an attractive place for archaeology, especially regarding issues such as the origins, dispersal, and interaction of ancient populations at different time depths and geographic routes. One challenge, though, has been the fragmented nature of the archaeological record here, well documented in some cases while under-studied in other areas.

As almost every region in ISEA has been colonialized by external countries, the discipline of archaeology has developed with influence

from those imposed political systems. Some distinctions can be noticed before and after World War II. At different times, the Philippines were claimed by Spain and the USA, Malaysia was under British authority, Indonesia was controlled by the Netherlands, East Timor was ruled by Portugal, and a broad and diverse expanse of the region was occupied by Japan.

This entry offers a large-scale view of archaeological practice in the region of ISEA. First, the history of the discipline is reviewed, from its inception through the present day. Next, key research issues and debates are identified, such as regarding the formation of the major populations of cultural groups living in ISEA during different periods of human evolution. Special focus here is given to the ongoing questions about the origins and dispersals of the Austronesian groups, involving input from archaeology, linguistics, genetics, and additional studies over the last few decades. This review provides a basis to consider international perspectives and future directions of archaeology in ISEA.

Definitions

In this entry, the region of Island Southeast Asia (ISEA) extends from Taiwan in the north and continues southward through the Philippines, Island Malaysia (including Sarawak and Sabah of Eastern Malaysia, plus Brunei), Indonesia, and East Timor.

History of Regional Research

The development of archaeology in ISEA traditionally has been divided into three major stages (see Tsang 2000; Chia 2017; Paz 2017; Simanjuntak 2017a). The early years of the discipline have been described as an *emergent period*, leading up to (and in some cases continuing into) World War II (WW II: 1939–1945). Next, a *transitional period* has been mentioned as operating after World War II (1945) and lasting until the 1970s. The current status of regional archaeology has been considered as a continuation of a *developmental period* since the 1970s.

Emergent Period, Before World War II

As was the case in many parts of the world, the earliest archaeology activities in ISEA were due to the adventures of foreign travelers in the habit of collecting antiquities. The initial pioneering forays were designed to learn the baseline scope of archaeological sites and artifacts in each area, for example, as potentially could be displayed in a museum. These explorations began as early as the 1800s, at a time when the discipline of archaeology was just beginning to take shape internationally.

Formally proclaimed as a British Colony in 1867, Malaysia witnessed archaeological inquiries earlier than most other countries of ISEA. Visiting researchers explored the rainforests and caves, and some of the region's first museums were established. Sarawak in particular attracted attention at the Niah and Bau Caves, studied in 1873–1878 by Alfred Hart Everett, Charles Darwin, Alfred R. Wallace, and Thomas H. Huxley (Harrisson 1954). Slightly later, projects were launched at caves along the east coast of Sabah, studied by C.V. Creagh in 1888–1895 (Rutter 1929: 217). Two of the oldest traditions of ISEA archaeology were stablished as the Sarawak Museum in 1886 and the *Sarawak Museum Journal* in 1911.

Indonesia has attracted natural scientists and curious collectors since Dutch control of the region as early as the 1600s, although archaeology specifically became more popular after major discoveries of the late 1800s. The key turning point for archaeology began with the historic finds of hominin fossils, *Pithecanthropus erectus* (later *H. erectus*), recovered by Eugène Dubois at Trinil, East Java in 1891 (Fig. 1) (Dubois 1896). Since then, several other *Homo erectus* discoveries have been reported, such as the fossils at Ngandong and the findings associated with stone tools of a "Sangiran flake industry" at Sangiran. Meanwhile, archaeology research offices were established, notably including *Oudheidkundige Dienst* (archaeological office) (Simanjuntak 2017a). Between 1931 and 1937, H. R. van Heekeren worked with W.J.A. Willems in East

(Image source: Hsiao-chun Hung)

Java and South Sulawesi, and then 2 years later (in 1939) van Heekeren started the first excavation in Indonesia at Kedeng Lembu, Jember (Glover 1974). Farther south, in today's East Timor, Alfred Bühler conducted the first excavation there in 1935 (Sarasin 1936).

The first discovered archaeology site in Taiwan, Zhishanyan in Taipei Basin, was reported by Japanese school teacher Awano Dennojou in 1896. Before 1949 when the Chinese archaeologists moved from mainland China to Taiwan, Japanese scholars had discovered more than 100 prehistoric sites in Taiwan and surrounding islands. One of the most influential figures of that period was Tadao Kano, known for discovering numerous sites and for developing the first archaeological chronology of Taiwan (e.g., Kano 1946, 1952) (Fig. 2).

Philippines archaeology can be traced back to the early 1920s. H. Otley Beyer, an American anthropologist who later shifted to archaeology. Beyer conducted several excavations in Novaliches, and he collected large numbers of artifacts especially from Rizal, Bulacan, and Batangas of southern Luzon (Beyer 1926, 1947, 1948). Beyer was the first scholar to build a chronological narrative of material artifact categories in the Philippines. Until now, Beyer's chronology has influenced the thought and practice of Philippines archaeology.

Transitional Period, from World War II (1945) Through the 1970s

After World War II, archaeology as a discipline transformed worldwide, including major change not only in political influence but also in broad aspects of theory, method, and technique. Most countries in ISEA transferred into new political status and associations, with direct influence on how archaeology could be practiced and on how the research findings were perceived in national and international narratives. Meanwhile, profound impacts in archaeology developed in philosophical thought, as well as in the science of excavation procedures.

Overall during the decades of the 1940s through 1970s, archaeology became accepted as a way to learn concrete evidence directly from the past. Controlled excavations proceeded in carefully exposing individual geological and sedimentary layers, each associated with a measured time period and characterized by a set of tangible objects. Chronological sequences became even more robust after the availability of radiocarbon dating since the 1950s.

At the end of the Chinese Civil War (in 1948), a group of Mainland Chinese archaeologists moved into Taiwan with the Kuomintang (KMT) government of the Republic of China. Those scholars mostly had worked in northern China, and they brought their experience into Taiwan while forming the first archaeology division of the Institute of History and Philology (IHP) at Academia Sinica. LI Chi became the first head of this archaeology division at IHP, and furthermore he established the Department of Archaeology and Anthropology (now re-named Department of Anthropology) at National Taiwan University in Taipei.

In the Philippines during the 1950s through 1960s, American archaeologist Robert Fox conducted the first two systematic archaeological excavations, aiming to delineate the chronological sequence of artifacts in dated archaeological layers. One project was at Calatagan in Batangas of southwest Luzon (Fox 1959), and another was at the Tabon Cave Complex in Palawan (Fox 1970). The results supported a long-term chronological narrative that outlined thousands of years of cultural history, starting with ancient hunter-gatherer sites and continuing through later historical contexts.

In Sarawak and in Sabah of Malaysia, Tom Harrison organized excavations at several caves during the 1950s through 1960s, with special emphasis at the Niah Caves of Sarawak. The project at the Niah Caves expanded to accommodate input from paleontology, zoology, geology, botany, and radiocarbon dating (e.g., Harrisson 1957, 1958a, b, c, 1959a, b, 1967, 1968, 1970). Harrison explored caves along the east coast of Sabah (Harrisson 1973), yet the project at Niah Caves consistently attracted the most international attention for the numerous burial findings that extended through several thousands of years.

After World War II, H.R. van Heekeren returned to Indonesia in 1945, continuing his prior studies with new techniques and motivation. He completed his major works for outlining the chronological sequence of Indonesia and for describing the artifacts belonging to the individual time periods, especially concerning the Bronze–Iron Age of Indonesia (van Heekeren 1958) and the Stone Age of Indonesia (van Heekeren 1972). From 1950 until leaving Indonesia in 1956, van Heekeren trained new staff for the archaeological office, while he undertook several excavations with R.P. Soejono at Anjar in West Java, at sarcophagus burials in Bali, and at cave sites in Flores and Centeral Java (Glover 1974).

During the decades leading up to the 1970s, archaeology in ISEA for the most part was performed by foreign researchers, while those

projects created opportunities for the first generations of local scholars. Among those local scholars were Wen-Hsun Sung in Taiwan, Alfredo E. Evangelista in the Philippines, and R.P. Soejono, T. Jacob, and S. Sartono in Indonesia. Soon, they assumed the responsibilities for archaeological investigations and museum programs in their home countries.

Developmental Period, Since the 1970s and Continuing Now

Since the 1970s and continuing now, two aspects have characterized archaeology in ISEA, mirroring worldwide trends. One aspect has involved the development of new schools of thought in how to perceive of the archaeological record and how to formulate questions of relevance for broader social studies such as in the field of anthropology. Another aspect has involved the increasing role of indigenous scholars in shaping the practicalities of archaeology in each country.

In Taiwan, one of the major influential projects occurred during the 1970s, known as the *Interdisciplinary Cooperation Research Plan for the Natural and Cultural History of the Zhuoshui River and Daduxi River Basins in Taiwan Province*. The project was developed by Taiwanese archaeologist K.C. Chang, who had received formal Ph.D. training at Harvard University in the U.S., in collaboration with the local Taiwanese scholar Wen-Hsun Sung. During the years of 1972–1976, this project linked archaeology with ethnology, geology, landscape ecology, zoology, botany, and pedology. The results greatly strengthened the baseline of chronological studies in Taiwan, and furthermore archaeology was situated prominently within an interdisciplinary context. Meanwhile, archaeology in Taiwan grew in its international standing, owing to a number of unique characteristics of the local cultural traditions linking between Mainland East Asia and ISEA, with further implications of linking with Pacific Oceania, all potentially studied through the archaeological record.

In the Philippines since the 1970s, archaeology projects have continued at a number of key sites, viewed as representative or perhaps even iconic of the region's cultural history. Multi-disciplinary teams have incorporated archaeology as part of studying sites of Palawan, led by the National Museum of the Philippines (Peralta 1983), and this particular area attracts an ever growing number of archaeologists with different research interests. Archaeology has been the central or sole focus of studies in other regions of the Philippines, for example in northern Luzon, involving the discovery of ancient animal bones and stone tools in the Liwan Plain (Fox and Peralta 1974; Shutler and Mathisen 1979; Wasson and Cochrane 1979), the deep excavations for disclosing many thousands of years of human presence at the Peñablanca Caves (e.g., Ronquillo 1981; Thiel 1986a–1987, 1988–1989; Mijares 2005, 2006a, b; Mijares et al. 2010), and the excavations within and extending deep beneath the extensive shell middens along the Cagayan River (e.g., Cabanilla 1972; Thiel 1986b–1987; Aoyagi et al. 1993, 1997; Ogawa 2002a, b, 2005; Tanaka 2002, 2004; Hung 2005, 2008). So far, more than 30 sites in the Cagayan Province have revealed layers spanning through the last few thousands of years of changing pottery and other artifacts, thus providing substantial detail about the regional archaeological sequence (Fig. 3).

During the 1970s and 1980s, local Malaysian scholars began to receive overseas academic training in Australia and elsewhere, and they returned to Malaysia as the first generation of archaeologists shaping the discipline internally. Their primary interests were in outlining the local chronological sequence and then refining specific aspects of the sequence to address particular questions such as about the ancient lives of hunter-gatherers, the emergence of pottery traditions, the development of sedentary societies, and more (Chia 2017). Among the first local scholars, Zuraina Majid provided new understanding of the Malaysian archaeological sequence and food resource economy at Niah, based on her primary excavations in 1977 (Majid 1982). Adi Haji Taha's excavations at Gua Cha and other sites documented the long narrative of human presence since more than 10,000 years ago and continuing through the modern-day Orang Asli (e.g., Taha 1985, 1987, 1991). In 1995, the Center for

History and Current Debates of Archaeology in Island Southeast Asia, Fig. 3 One of the large shell midden sites, Magapit shell midden, located in Lal-lo, Cagayan, northern Philippines. (Image source: Hsiao-chun Hung)

History and Current Debates of Archaeology in Island Southeast Asia, Fig. 4 The field station at Lenggong for intensive field research in this region undertaken by the Center for Archaeological Research, University of Science Malaysia. (Image source: Hsiao-chun Hung)

Archaeological Research Malaysia at the University of Science Malaysia was established, and so far it has produced more than 15 Ph.D. and 30 M.A. graduates (Chia 2017), while serving as the leading archaeology institute and authority of the country (Fig. 4).

Since the 1970s in Indonesia, archaeology has been increasingly important in government policies, national identity, and international relations. In 1975, the Institution of Archaeology and National Heritage (Lembaga Penelitian Purbakala dan Peninggalan Nasional) was divided in two new entities, including the Directorate of History and Archaeology (Direktorat Sejarah dan Purbakala) for the duty of protection and conservation, and the National Research Center for Archaeology (Pusat Penelitian Arkeologi Nasional), for the purpose of research. Since then, the National Research Center for Archaeology has undertaken innumerable national archaeological projects, as well as collaborations with visiting international teams (see Simanjuntak

History and Current Debates of Archaeology in Island Southeast Asia, Fig. 5 The Harimau cave in South Sumatra, so far more than 80 human remains belong to two layers of ancient populations (the earlier Australo-Melanesian and the later East Asian-Austronesian) have been discovered. (Image source: Hsiao-chun Hung)

2017a). Among the many significant findings have been the definition of Acheulean stone tools in Sangiran, central Java (e.g., Simanjuntak and Forestier 2008; Simanjuntak 2011), of *Homo floresiensis* at Liang Bua, Flores (e.g., Brown et al. 2004, Morwood et al. 2004; see below), of rock art in Maros, Sulawesi (Aubert et al. 2014) and in Borneo (Aubert et al. 2018), of a large burial complex of Australo-Melanesian and East Asian populations of two layer formation at Harimau cave, South Sumatra (Simanjuntak 2016; Matsumura et al. 2018) (Fig. 5), and of early pottery-bearing sites in the Karama Valley in Sulawesi (e.g., Simanjuntak 2008; Anggraeni et al. 2014).

The above-mentioned research projects (among many others not detailed here, due to the space limit), have contributed to our baseline understanding of archaeology in ISEA, and they have provided the essential core data for guiding new investigations. Some of those projects have been ongoing and continually re-shaping with new generations of archaeologists. Inevitably, interpretations of the data have been variable, in some cases creating the grounds for academic debates.

Key Issues and Current Debates

In ISEA, several archaeology research issues of global significance have been controversial, leading to debates among scholars and shaping much of the published literature. Perhaps the most enduring debates have revolved around the dating and context of *Homo erectus* fossils, the appearance of the first anatomically modern human (AMH) or *Homo sapiens* in the region, and the development of cultural groups today known as the Austronesian people.

Homo erectus in ISEA: Dating, Craniometric Variation, and Relation with Fossils in Northern China

Fossils of *Homo erectus* in Indonesia have prompted questions about how long ago these ancient

hominids reached into ISEA, how they related with other groups of their species in other regions, and what happened later with the appearance of anatomically modern humans (AMH or *Homo sapiens*). The major fossil findings in ISEA have been in Java, at sites such as Trinil, Sangiran, Mojokerto, Sambungmacan, and Ngandong. Dating has been imprecise, relying on approximations of the ages of associated geological layers, but the age range overall has been congruent with *Homo erectus* in other regions, as old as 1.2–0.8 Ma and continuing at least through 0.75–0.4 Ma.

In a global view, *Homo erectus* as a species has been regarded as an ancient and now extinct hominid, including some members of the species who had migrated from Africa into Asia and evidently as far as Indonesia in ISEA, prior to the evolutionary appearance of *Homo sapiens*. Any findings of *Homo erectus* fossils can offer insights into our ancient evolutionary history. The findings in ISEA in particular deserve close attention about the possibility of localized variation within the species, given the geographic distance from other areas where *Homo erectus* had lived.

The fossils of *Homo erectus* in Java have exhibited some variation in their forms, and accordingly scholars have argued about what those morphological differences could imply or represent (e.g., Weidenreich 1943; Antón 2002; Baba et al. 2003; Kidder and Durband 2004; Zeitoun et al. 2010). Some scholars have proposed that *Homo erectus* had evolved with distinctive physical traits uniquely in Java, while other scholars have proposed a population replacement by other members of the *Homo* Genus. Currently, the evidence points to a long-term unbroken continuity of *Homo erectus* in Java (Kaifu 2017), yet this framing still could allow for debates about how much physical variation can be accepted within the overall definition of a biological species such as *Homo erectus*.

The *Homo erectus* fossils in Java definitely look different from the counterpart fossils of the same species as reported in China, specifically in Zhoukoudian at 0.75–0.4 Ma (see Shen et al. 2009; Antón 2002). Measurements of cranial morphology reveal that the faces looked different among those individuals in different regions. These variations are difficult to interpret, to some extent constrained by the small numbers of individuals that can be represented in the fossil records. The key point of debate has been about how to view the range of variation as occurring within the biological species or else suggesting distinctively separate variants or even perhaps subspecies.

Appearance of Anatomically Modern Humans (AMH or *Homo sapiens*) in ISEA: Timing, Migration Routes, and Number of Migrations

In ISEA, the appearance of anatomically modern humans (AMH or *Homo sapiens*) relates with several significant questions. First of all, when did the species enter into the region? Related with this first question, what was the migration route, and were multiple routes possible? Could more than one migratory event have occurred? Furthermore, how did the members of the *Homo sapiens* species interact with other members of the *Homo* Genus in different areas?

The dating issue can be framed within the parameters of when *Homo sapiens* first dispersed from the African continent and then when their descendants definitely had reached as far as Australia and New Guinea. The oldest evidence of *Homo sapiens* outside Africa could be interpreted as perhaps 100,000 years ago in the Israel, thus constituting an oldest bracket for the possible dating of the species entering into ISEA. Equally important, human remains have been confirmed in Australia about 50,000 years ago (noting older dating still under debate), supported by further evidence of stone tools in New Guinea within the range of 47,000–42,000 years ago, thus indicating that *Homo sapiens* must have passed through ISEA by that time and perhaps much earlier. Given those time brackets, *Homo sapiens* first may have migrated into ISEA at some time between 100,000 and 50,000 years ago.

Ancient remains of *Homo sapiens* have been reported at several sites in ISEA, but dating has been problematic with poor preservation and contextual association in many cases. From Fox's excavations in Palawan of the Philippines, human remains have produced dating of

History and Current Debates of Archaeology in Island Southeast Asia, Fig. 6 The Callao Cave in Peñablanca of northern Luzon of the Philippines has produced *Homo* sp. (?) dated as 66.7 ± 1 ka. (Image source: Mike T. Carson)

approximately 47,000 years ago by Uranium series (Detroit et al. 2004). Also in the Philippines, a metatarsal element from Callao Cave in Peñablanca of northern Luzon has been suggested as belonging to *Homo* sp., dated at 66,700 years ago by Uranium series (Mijares et al. 2010) (Fig. 6). The "Deep Skull" of the West Mouth of the Niah Caves in Sarawak, East Malaysia, has been dated to approximately 40,000 years ago (e.g., Harrisson 1959a, 1970; Brothwell 1960; Kennedy 1979; Barker et al. 2007). In Indonesia, bones of early *Homo* sp. have been reported at Punung (Storm et al. 2005) and Wajak in Java about 37,000–24,000 years ago) (Storm et al. 2013), as well as at Lida Ayer in Sumatra about 73,000–63,000 years ago) (Westaway et al. 2007).

These early findings of *Homo sapiens* in ISEA could be questioned on technical grounds. For instance, radiocarbon dating so far cannot extend beyond 50,000 years ago, and therefore any older dating must rely on other procedures with inherently wider error ranges of several thousands of years. Additionally, some of the taxonomic identifications have been challenged, such as the metatarsal fragment at Callao Cave in the Philippines, possibly attributed to a species other than *Homo sapiens* with similar metatarsal structure (O'Connell et al. 2018).

Ongoing research programs have been investigating issues of Archaic Hominin populations and early *Homo sapiens* in ISEA. Researchers have sought to clarify and refine the dating, biological affinities, geographic extent, and contexts of extinction of various species of the *Homo* Genus. Among the most notable examples have been the studies of fossils of *Homo floresiensis* in Flores Island of eastern Indonesia (e.g., Brown et al. 2004; Morwood et al. 2004, 2005; Jacob et al. 2006; Morwood and Jungers 2009; Brown and Maeda 2009; Kaifu et al. 2011, 2015a, b; Kubo et al. 2013; Henneberg et al. 2014; Sutikna et al. 2016; Brumm et al. 2016; van den Bergh et al. 2016), as well as the studies of ancient DNA suggesting admixture between modern and archaic (premodern) hominins such as Denisovans (e.g., Reich et al. 2011; Cooper and Stringer 2013; Kaifu 2017).

History and Current Debates of Archaeology in Island Southeast Asia, Fig. 7 Children of Ilocano-Austronesian in Alaguia, Lal-lo, Cagayan of northern Luzon, Philippines. (Image source: Hsiao-chun Hung)

Formation of Major Cultural Groups in ISEA: Cultural History of the Austronesian-Speaking Populations

Another enduring debate in ISEA archaeology has involved notions of how the region's different cultural groups and traditions came to exist, possibly through a series of migrations and interactions. Central to these debates, scholars have considered how the modern-day Austronesian-speaking groups came to be so broadly distributed all across the region and extending farther into Madagascar and into Pacific Oceania (Fig. 7). Much of the scholarly interest at first was pursued through studies of language history and living cultural traditions, and archaeology was added into the debates mostly since the 1970s. Many of the disagreements among archaeologists can be traced back to the 1970s or even earlier, prior to the availability of the most relevant archaeological data in the region. Currently, the archaeological records have developed with considerably more refinement than was possible in the 1970s, and meanwhile physical anthropology and other lines of evidence have provided additional supporting information.

Two quite different hypothetical models have been proposed about the origins of modern Southeast Asian populations, now known as the *Regional Continuity Model* and the *Two-Layer Hypothesis*. The *Regional Continuity Model* proposes that modern Southeast Asians developed in situ from local ancestors without significant incoming genetic admixture (e.g., Turner 1990). The *Two-Layer Hypothesis* argues that SEA was occupied initially by groups such as the Australo-Melanesian populations, and then later substantial genetic admixture occurred with East Asian immigrants who brought farming and other innovations into the local cultural inventories (e.g., Jacob 1967). Recently, the *Two-Layer Hypothesis* has gained solid support from bio-archaeology studies of cranio-morphometric comparison (e.g., Matsumura et al. 2018, in press) and ancient DNA studies (e.g., McColl et al. 2018). These studies concluded an earlier layer of Australo-Melanesian groups and a second layer of East Asian groups.

The research themes about the Austronesian origins and dispersals have been at the center of numerous projects all across ISEA for the last few decades. The related issues and debates can be complicated, and they are treated in more detail here in terms of the development of archaeology as a discipline in ISEA.

Academic Debates of Austronesian Origins

As the Austronesian-speaking populations comprise the majority of the modern ISEA communities, their origins and homelands have been subjected to ongoing debates among scholars of

different fields (e.g., Bellwood 1997, 2005; Oppenheimer 2004; Tsang 2005; Solheim 1988, 2006; Barker and Richards 2013). Numerous hypothetical models have been contradictory, and many have failed to refer to convincing evidence. The two most influential models provided by archaeologists have been the *Nusantao Maritime Trade and Communication Network (NMTCN) Model* and the *Farming-language Dispersal Hypothesis* (aligned with the *Out of Taiwan Model*).

The *Nusantao Maritime Trade and Communication Network Model*

A popular model has persisted as the *Nusantao Maritime Trade and Communication Network (NMTCN) Model*, despite no actual archaeological or linguistic evidence in support of it. The intellectual basis refers to the strong sea-faring traditions in ISEA, noting that people for several centuries have been highly skilled long-distance navigators. Solheim (e.g., 1988, 2006) described these people as the *Nusantao*. Some groups have been known as sea nomads, ranging over vast expanses of the region.

The *NMTCN model* involves more than just the movement of sea-crossing experts, and it explicitly calls for a locus of cultural origin activity within the central to southern provinces of ISEA, expanding radially from there into the farther edges of the region. In this view, Taiwan could not have been the origin of the population movements, and thus it disagrees with the *Out of Taiwan Model*. Moreover, the traditions of sea-crossing networks are described as originating long prior to a pottery-bearing horizon and pre-dating the Austronesian-speaking groups.

In one variant of *NMTCN Model*, Meacham (1988) proposed that Austronesian languages and other cultural traits evolved locally within a large triangular area with apex points at Taiwan, Sumatra, and Timor. The pottery-bearing horizon could be seen as emerging within this large region overall, termed *Austronesia* as a whole, rather than spreading from Taiwan into other areas in steps or stages (Fig. 8). This model now has been contradicted by the archaeological evidence and by independent linguistic studies.

Another iteration of the *NMTCN Model* was formulated by Solheim (2006: 90), most recently articulated as:

> The *Nusantao* began developing Pre-Austronesian as their trade language starting around 12,000 BP [years before present], forming over the vast territory from the east coast of Vietnam to the Bismarcks in northwestern Melanesia (Wallacea could be considered its homeland), and then Proto-Austronesian developed among the sailors and their families of the *NMTCN* in their communication and trading back again to the west through much of coastal eastern Indonesia and the Philippines, and along the coast of eastern Vietnam and South China.

Many of the concepts of the *NMTCN Model* had emerged prior to the availability of high-resolution archaeological data and other lines of evidence. For example, Solheim (e.g., 1964, 2006) stressed the links between Sa Huynh pottery in Vietnam and Kalanay pottery in the Philippines as evidence of a deeply ancient *Nusantao* sea-crossing network that would have excluded Taiwan from the origin story of Austronesians. Now these Sa Huynh-Kalanay pottery traditions are abundantly documented as post-dating 2500 years ago in Iron Age contexts (e.g., Reinecke et al. 2002; Hung et al. 2013), at least 1500 years more recent than the initial spread of a pottery-bearing horizon in ISEA (see below).

While the *NMTCN Model* lacks direct supporting evidence, its proponents have sought support in two ways. First has been to question the validity of the historical linguistics conclusions of a Taiwan origin of the Austronesian languages that spread into other parts of ISEA, although so far this conclusion has not been overturned. Second has been to question the dating of pottery-bearing horizons in different areas, although in fact the dating in Taiwan was much older than anywhere else in ISEA and then proceeded in discernable steps across the region.

The *Farming-language Dispersal Hypothesis* and *Out of Taiwan Model*

The *Farming-language Dispersal Hypothesis* and the *Out of Taiwan Model* have been linked together conceptually, but they should not be mistaken as a singular entity. Both are outlined here. According to the *Farming-language Dispersal Hypothesis*, many of the world's major migrations

History and Current Debates of Archaeology in Island Southeast Asia, Fig. 8 Successive Austronesian language homelands and movements, suggested by Solheim and by Meacham. (Graphics source: Solheim 2006: 88, 91)

occurred by farmers seeking new lands for their crops and livelihood, and the farming populations in most cases spoke unified languages (Bellwood and Renfrew 2002). In this view, land-dependent farming eventually would force some portion of a population to move into new territory. When people migrated, they brought their languages and other cultural traits with them, and they tended to move in multiple instances within short periods of time, resulting in archaeological records of apparently rapid geographic spreading.

The *Farming-language Dispersal Hypothesis* in itself does not point to any specific migration route of the Austronesian-speaking groups who eventually spread through ISEA, but rather an independent line of evidence has come from linguistic studies that point to Austronesian language origins in Taiwan, hence building the framework for the *Out of Taiwan Model* (Fig. 9). According to the historical linguistic studies, the Austronesian languages are unified in a number of branches that reflect their order of separation and divergence form one another through time. When examining the inter-relationships of these branches in the Austronesian family, the oldest variants appear to be retained in Taiwan, and then a series of later branches can be mapped moving into various parts of ISEA and even later into the provinces of Pacific Oceania (Blust 2013).

Conceptually, this hypothesis would require testing through the material archaeological inventories of ISEA to identify what traits could reflect the arrival of Austronesian-speaking groups and their geographic expansion across the region. Depending on the patterns that are found, they may or may not validate the linguistic outline of the *Out of Taiwan Model*. Those material inventories could be examined for signs of past farming or other food production, toward testing the *Farming-language Dispersal Hypothesis*.

Bellwood (2005) recognized the pottery-bearing horizon as the most likely candidate to mirror past populations movements in ISEA. Looking at the cross-regional archaeological findings of ISEA, a sudden pottery-bearing horizon can be traced as moving generally from Taiwan well prior to 5000 years ago, then into different parts of ISEA after 4000 years ago and continuing for some centuries. This pottery trail reflected the geographic spread of cultural traits and ideas that logically involved the movement of people to certain degree. The geographic pattern accorded with the major steps in the linguistic history outline of the *Out of Taiwan Model* (Blust 2013). Bellwood further postulated that the Austronesian-speaking groups had migrated not only with pottery traditions but also with land-dependent farming systems or other forms of formal food-producing economies that forced people to seek new territories, in alignment with the *Farming-language Dispersal Hypothesis*.

Current Evidence and Research Questions

Now with more investigations throughout ISEA, as well as in neighboring areas of MSEA and East Asia, a more refined picture is emerging about the *Two-layer Hypothesis*. The older "first" layer of Australo-Melanesian hunter-gatherers now can be associated with flexed-burial traditions, and then the later "second" layer of East Asian sedentary groups now can be associated with extended-position burial traditions. Additionally, this "second layer" included the Austronesian-speaking groups who derived from East Asian biological affinities, and many of the sites in Mainland China and Taiwan showed clear evidence of rice farming economy (e.g., Hung et al. 2017; Matsumura et al. 2018, in press).

In terms of seeking how the apparent two population layers could match with a change in the archaeological record of ISEA, the association coincided mostly with the appearance of a pottery-bearing horizon at sites that furthermore have shown signs of sedentary lifestyle, beginning as early as 4000 years ago in some places of ISEA. Even later extensions of the pottery trail moved into Pacific Oceania after 3500 years ago (e.g., Hung 2005, 2008; Hung et al. 2011; Carson et al. 2013).

So far, the cross-regional evidence of a pottery trail indicates at least three major steps in the large-scale picture of ancient population movements across ISEA. First, people in Taiwan had developed traditions of farming rice and millets, living in formal villages, and making varied

History and Current Debates of Archaeology in Island Southeast Asia, Fig. 9 The *Out of Taiwan Model* according to Bellwood. (Graphics source: Peter Bellwood, modified from Bellwood et al. 2011, Fig. 16.8)

History and Current Debates of Archaeology in Island Southeast Asia, Fig. 10 Examples of red slipped pottery, including a carinated jar with everted rim and an open footed bowl, from Nagsabaran Neolithic cultural layer, Cagayan, northern Luzon, Philippines. (Image source: Hsiao-chun Hung)

pottery by 4800 years ago or perhaps earlier. Second, by 4000 years ago, related groups moved into the northern Philippines, bringing a sudden and distinctive pottery-bearing horizon with links to Taiwan at that time (Fig. 10), yet the composition of food production has been unclear. Third, by 3500 years ago, the pottery-bearing horizon spread through more areas of ISEA. This pottery-bearing horizon often has been regarded as a *Neolithic* or N*ew Stone Age* association, overlaying and eventually replacing the older contexts of hunter-gatherer sites in the region. Those material traits appeared suddenly and then spread incrementally across the geographic expanse of ISEA, consistently replacing the older traditions of stone tool complexes. Furthermore, the new traditions of pottery, other artifacts, village layouts, and farming systems could be linked with the modern-day and historically known Austronesian-speaking groups of ISEA.

Overall, the pottery-bearing horizon represented the geographic spread of people, materials, and ideas throughout ISEA, generally during the centuries following 4000 years ago. The archaeological records prove that people already had been living in the region for many thousands of years prior to that time, so logically some degree of population admixture must have occurred. In some exceptional cases, local indigenous populations may have continued entirely intact in a biological sense, simply adopting some of the technologies and lifeways associated with the new pottery-bearing contexts. In other extreme cases, people bringing pottery and additional traits may have completely replaced the pre-existing groups. The reality probably was more complicated and variable, but eventually the Austronesian languages came to be spoken all across the region with definite implications about actual population dynamics. If the Austronesian languages were so successful in spreading throughout the region, then other cultural traditions and probably the physical populations were involved as well to a significant degree.

Given the strong congruence of the linguistic and archaeological findings (Bellwood et al. 2011), the *Out of Taiwan Model* appears to be robust and valid for describing the geographic spread of populations across ISEA. This descriptive evidence overall is consistent with the expectations of the *Farming-language Dispersal Hypothesis*, particularly for the starting point in eastern Taiwan where rice was cultivated in rather limited land, dated to 4200 years ago (Deng et al. 2018).

According to the *Farming-language Dispersal Hypothesis,* the population movements most likely were motivated by people seeking new lands for their food-producing land-use systems, but currently the direct evidence of farming has been inconsistent, and apparently the timing and composition differed across ISEA. Looking critically into these issues, the precise details of land-use systems must have been variable over the vast geography and time spans involved in the

Austronesian diaspora. Rice farming eventually gained prominence in most areas of ISEA, but each of those earliest movements may have involved somewhat different motivations for the migrant groups, as well as somewhat different subsistence land-use patterns. Research into this topic has been ongoing (Carson and Hung 2018), and the findings have been varied in different site-specific cases. This current understanding suggests a different scenario from a prior characterization of a rapid movement of people from Taiwan all the way eastward into Polynesia, as an *Express Train Model* (e.g., Diamond 1988).

Recently, Simanjuntak (2017b) proposed an Eastern Route Migration (ERM) of Austronesian people who brought red-slipped pottery traditions from Taiwan into the Philippines, northern Borneo, Sulawesi, and Pacific Oceania, separate from a Western Route Migration (WRM) of Austroasiatic people who brought cord-marked pottery traditions from MSEA through Peninsular Malaysia and into Sumatra and Borneo (Fig. 11). While the red-slipped pottery horizon has been well documented and dated at several sites of ISEA reflecting a large-scale ERM, the situation has been considerably more complicated for a WRM at the western edge of ISEA, as there are pre-existing early hunter-gatherer communities of Australo-Melanesian affiliation (Matsumura et al. in press) lived along the western side of the South China sea coast (in southern China, coastal Vietnam, Thailand, and the Malaysian Peninsula) with pottery production at least as early as 7000–4000 years ago (Hung in press). Thus, the role of WRM will need future investigation for clarifying its relation with ancestral Austronesian groups.

Looking just at the pottery-bearing horizon as a prime indicator, ancient population dispersals occurred over the course of some centuries, and conceivably the contexts of population movements had changed through time. Some of the internal details have been arguable and subjected to ongoing investigations that continue to

History and Current Debates of Archaeology in Island Southeast Asia, Fig. 11 The proposed two routes of Neolithic migrations, Austroasiatic and Austronesian, into Indonesia and the geographic distribution of sites with red-slipped and cord-marked pottery. (Graphics source: Simanjuntak 2017b)

generate new factual datasets. At least four major research programs have targeted: (1) the dating and definition of different early pottery assemblages in coastal Mainland SEA (e.g., Peninsular Malaysia) and Sumatra, noting their relation with ancient Austronesian societies in the region; (2) the roles of domesticated animals (e.g., dogs, pigs, and chicken), especially in cases of their sea-crossing translocation; (3) the emergence of farming or other formalized food-producing land-use systems in early ISEA; and (4) the ancient relationships between two or possibly more biological populations meeting in this region of ISEA.

In summary, the linguistic evidence is essential for outlining the *Out of Taiwan Model* of Austronesian dispersals through ISEA, and archaeology offers a way to test this model and furthermore to clarify the dating and associated context of the individual steps in ancient population movements. So far, the weight of archaeological evidence currently supports the *Out of Taiwan Model*, with strong suggestions in favor of the *Farming-language Dispersal Hypothesis* as well as the *Two-Layer Hypothesis*. As mentioned, studies of both modern and ancient DNA consistently have confirmed the expectations of the *Two-Layer Hypothesis* and of the *Out of Taiwan Model* (e.g., McColl et al. 2018). The findings suggest a pre-existing widespread Australo-Melanesian affinity throughout ISEA, later with increasing amounts of East Asian affinity in contexts of red-slipped pottery after 4000–3500 years ago. The East Asian affinities include definite links with Taiwan and coastal China as the deeper ancestral origin of the people who later spread throughout most of ISEA. No evidence at present can support the *NMTCN Model*.

While the *Out of Taiwan Model* may be regarded as portraying ancient population movements accurately, a number of core questions continue to drive regional research. The major focus for improving knowledge will be in developing and testing explanatory theories of the evident patterns and trends, such as proposed in the *Farming-language Dispersal Hypothesis* as a way to explain the evidence for the *Out of Taiwan Model*. In this regard, new lines of evidence will need to be brought into a comprehensive re-evaluation of the evidence, most likely looking at the new emerging findings in archaeo-botany and other specializations that still are in process of recovering primary datasets from relevant sites cross-regionally. Moreover, other hypothetical explanatory theories should be considered, although they would need to be logically consistent with the evidence in order to withstand testing with real data.

International Perspectives

Within the scope of what currently is known of ISEA archaeology, ample opportunities can be explored for solving questions and refining the available datasets. At present, the region-wide chronological narrative describes the early *Homo erectus* at 1.2–0.8 Ma, the first modern human more than 50,000 years ago, followed by the arrival and spread of rather large scale of human migrations, and then the Austronesian groups with a number of other changing conditions within the last 4000 years. The exact dating and the inventories of material findings have varied from one site to another, in total revealing cross-regional patterns and chronological trends that have been essential for outlining the large-scale narratives of ancient migrations in different time intervals.

The most enduring research themes in ISEA archaeology, such as the issues of the first arrival of *Homo sapiens* and the issues of Austronesian migrations, have been cross-regional and transcending political boundaries involving Taiwan, the Philippines, Malaysia, Indonesia, East Timor, and beyond. A cross-regional approach has characterized ISEA archaeology for several decades, and this perspective continues to guide most research. The most enduring themes still relate to cross-regional questions, for example:

1. How many species of the *Homo* Genus have lived in ISEA? What were the relations between these *Homo* Genus and others outside ISEA?

2. How did different groups of the *Homo* Genus come to populate this broad and diverse region?
3. How, when, and why did ancient groups transition evidently from hunting-gathering to variable food-producing economies such as horticulture and farming?
4. How did the Austronesian language traditions develop into the historically known contexts of the region?
5. How did ISEA contribute to the formation of early Lapita cultural group in the Pacific Oceanic region?
6. How did ISEA begin its Metal Age (bronze and iron), historical kingdoms, and complex state polities?

Within the established large-scale parameters of the archaeological record, these and other questions continue to be addressed with increasingly refined results. The work as a matter of practicality has proceeded one site at a time, and gradually the site-specific details have allowed re-assessment of the large-scale narratives.

Future Directions

Archaeology as a discipline in ISEA has undergone more than 100 years of development. A number of transformations occurred under foreign colonial and imperial influence, then again during and after World War II, and continuing more with professional advancements and training in each ISEA country. At present, numerous international collaboration projects are operating in ISEA for archaeology research. Through time, we can expect more projects by indigenous archaeologists, along with more research collaborations among countries within ISEA (or SEA more generally).

In order to solve many research questions and debates, the need of linking data from multiple lines of evidence has been increasingly obvious. For example, several debates have continued about the *Out of Taiwan Model*, based on conflicting views of the archaeological findings in the western part of ISEA, such as in Borneo, in principle resolvable through clarifying the actual material evidence. Adding to these debates are long-standing disagreements about the concepts of *Neolithic* societies, the role of farming or other modes of subsistence economies, and the ability to examine pottery assemblages as cultural markers. Another factor in debates has been a healthy skepticism of grand narratives, effectively resisting them even without alternative evidence. Overall, the situation is beginning to be clarified through continual integration of archaeology with more lines of evidence from the advancing research in ancient genetics, archaeobotany, palaeo-landscape reconstructions, and other perspectives.

Today, new discoveries from ISEA frequently attract the world's attention, such as the recently reported "*700,000-year-old stone tools point to mysterious human relative in Northern Luzon*" (Ingicco et al. 2018), and "*World's oldest figurative painting discovered in Borneo cave*" (Aubert et al. 2018). New discoveries continually change our knowledge about ISEA, and furthermore they revise our thoughts about the ancient world in general. As many parts of ISEA still are unexplored by modern-day archaeologists, ISEA will continue to support significant discoveries by new generations of investigators.

History and Current Debates of Archaeology in Mainland Southeast Asia

Cyler Conrad
Environmental Stewardship, Los Alamos National Laboratory, Los Alamos, NM, USA
Department of Anthropology, University of New Mexico, Albuquerque, NM, USA

Introduction

In this chapter, I discuss the history and current debates of archaeology in Mainland Southeast Asia to evaluate the past, present, and future of archaeological investigation within this region. I discuss the history of archaeological research during the pre- and post-World War II eras and major issues confronting archaeologists today, including evidence for early hominins, Hoabinhian hunter-gatherers, the forager-to-farmer transition, and the transition to metallurgy and complex societies.

Definition

Mainland Southeast Asia (MSEA) is defined as the modern geopolitical region encompassing Cambodia, Laos, Peninsular Malaysia, Myanmar, Thailand, and Vietnam (Fig. 1). For archaeologists studying prehistoric cultures in this region, the southernmost provinces of China (e.g., Yunnan) are also included in MSEA. This region is geographically, and geopolitically, distinct from South Asia, primarily encompassing Afghanistan, Bangladesh, Bhutan, India, the Maldives, Nepal, Pakistan and Sri Lanka, East Asia, encompassing China, Japan, Mongolia, North Korea, South Korea and Taiwan, and Island Southeast Asia, including Brunei, Indonesia, Malaysia (non-Peninsular), the Philippines, Singapore and Timor Leste. The climate of MSEA varies, but it is a tropical and subtropical environment with warm temperatures and high humidity and rainfall patterns driven by the Southeast Asian monsoon system.

History and Current Debates of Archaeology in Mainland Southeast Asia, Fig. 1 Mainland Southeast Asia, and the sites discussed in text. (1) Spirit Cave and Long Long Rak, (2) Nong Ratchawat, (3) Ayutthaya, (4) Ban Non Wat, (5) Non Nok Tha, (6) Ban Chiang, and (7) Angkor Wat

In this chapter, I discuss important milestones in the history of archaeological research in MSEA and current debates facing archaeologists today. The archaeological record from MSEA spans the late-Pleistocene (~80–60,000 years ago) into the Neolithic, Bronze, and Iron Ages, the late prehistoric and protohistoric period, and modern times. In this entry, I base my discussion on the late-Pleistocene to Holocene record, from approximately 60,000–1500 years ago.

Historical Background

The history of archaeological research in MSEA is generally separated into two periods (see discussions by Chia 2017; Goh 2017; Heng and Phon 2017; Kim 2017; Marwick and Bouasisengpaseuth

2017; Shoocongdej 2017): the pre- and post-World War II (ca. 1939–1945) eras. These eras tend to coincide with the exploratory versus scientific periods in MSEA archaeological history.

Prior to the onset of World War II, archaeological research within MSEA was largely exploratory and tended to document sites of major cultural and religious significance, for example, the temples and monuments of Ayutthaya, Thailand, and Angkor Wat, Cambodia (Higham 1989). This period included the initial "discovery" of sites by nonlocal travelers and explorers, primarily Western Europeans, and the establishment of broad characteristics (i.e., the Three-Age System) in the cultural-chronological record. For example, in the early 1900s Madeleine Colani, working in northern Vietnam as part of the École Française d'Extrême Orient, excavated several prehistoric cave sites and identified the "Hoabinhian" lithic techno-complex (Colani 1927). Hoabinhian stone tools, which are often unifacially flaked river cobbles known as sumatraliths, occur throughout MSEA and are a major characteristic of prehistoric archaeological cultures (Fig. 2).

During the post-World War II period, archaeological research within MSEA shifted and became less exploratory and increasingly scientific and systematic. During this phase, especially during the 1960s–1980s, archaeologists investigating prehistoric human adaptations initiated more detailed analyses of organic remains at archaeological sites, directly dated the prehistoric record, and applied theoretical frameworks and expectations based on anthropological and archaeological theory. It was also in this post-World War II period that sites of major significance were excavated, including the hunter-gatherer site of Spirit Cave (Fig. 3; Gorman 1970) and Bronze Age sites of Ban Chiang (Gorman and Charoenwongsa 1976) and Non Nok Tha (Fig. 4; Bayard 1970). A major aspect of the archaeological history of the post-World War II period was the shift away from simply describing sites and assemblages toward question-driven research, methodological and theoretical debates, and a push for scientific advancement of the discipline.

Since several important archaeological sites in MSEA were excavated during the 1960s–1980s, many key issues and current debates surrounding these sites are directly impacted by this legacy record. In the following section, I discuss four major issues and debates surrounding MSEA archaeology.

Key Issues/Current Debates

There are four main much-debated issues and groups of material within MSEA archaeology: (1) the initial record of hominin dispersal and migration into this region, including by *Homo sapiens*, (2) the adaptations and cultural diversity of late

Pleistocene and Holocene hunter-gatherer groups utilizing the Hoabinhian stone tool techno-complex, (3) the process and consequences of the forager-to-farmer transition, and (4) the emergence of metallurgy and complex societies. Below, I will discuss each of them in turn.

Hominin Emergence

A critical issue confronting MSEA archaeologists is determining the exact process(es), route, adaptations, and hominin speciation present during the various stages of hominin colonization in this region (Dennell and Petraglia 2012; Marwick 2009). Although recent discoveries in Southern China suggest that *Homo sapiens* colonized MSEA as early as 120,000–80,000 years ago, we still lack the evidence required to fully understand hominin socio-economic adaptations during this period, particularly by *Homo erectus*, and the potential for long-term interaction between hominin species within MSEA. These unresolved issues and questions are crucial for determining the process(es) of human evolution within the MSEA tropics and how *H. sapiens* eventually migrated into Island Southeast Asia, Australia, and beyond. Based on current evidence, hominins in MSEA expanded further, earlier, and practiced more complex hunting and gathering strategies than previously suspected. Recent recovery of hominin skeletal material throughout ongoing excavations in MSEA, and analyses of ancient genetics, also indicates a more morphologically diverse population of hominins inhabited this region during the Pleistocene.

Hoabinhian Hunter-Gatherers

When Madeleine Colani (1927) famously coined the term Hoabinhian to describe a set of common characteristics in stone tools while working in northern Vietnam, she set in motion the use of a descriptive which would impact Southeast Asian archaeologists throughout the twentieth and twenty-first centuries. Today, almost 100 years after Colani's excavations, archaeologists investigating MSEA hunter-gatherers continue to debate the exact definition and use of the term Hoabinhian. The primary issue surrounding the Hoabinhian relates to whether this term should still exist in MSEA since it carries a set of assumed characteristics in hunter-gatherer societies which do not necessarily exist (Shoocongdej 2000). These characteristics are often defined as small foraging group sizes, highly mobile populations, and broad diets (Gorman 1970).

However, within MSEA there are large differences in the regional record of hunter-gatherer foraging adaptations, for example, between coastal regions along the Thai-Malay Peninsula in comparison to the northern Thai uplands and northeast Thai Khorat Plateau. Although Hoabinhian tools appear throughout these regions (see examples in Reynolds 1990), suggesting a common set of human adaptations, archaeologists continue to lack a robust understanding of what this technological pattern really means and what it really masks. Many well-known Hoabinhian sites were excavated during the 1960s–1980s, which makes fine-grained analyses of their legacy assemblages difficult. For example, due largely to poor preservation, there is little direct evidence for organic tool adaptations used by these prehistoric hunter-gatherers, and how tools (Hoabinhian or otherwise) relate to foraging strategies.

Determining the origin and controlling the chronology for the Hoabinhian also remains elusive. Colani identified northern Vietnam as the origin of the Hoabinhian; however, this techno-complex is found throughout every modern geopolitical country in MSEA (and possibly in parts of Island Southeast Asia). Today, Hoabinhian stone tools are found in directly dated deposits spanning approximately 40,000–3,000 years ago, and the oldest Hoabinhian tools are currently from Southern China. Clearly, as archaeological research continues in MSEA, we must critically examine the Hoabinhian lithic techno-complex and determine what this term truly means for understanding prehistoric human adaptations within this region.

Forager-to-Farmer Transition

Understanding the exact dynamics of the transition from foraging to farming in MSEA continues to be a complicated endeavor. Although archaeologists have a relatively detailed understanding of the artifactual record of Neolithic population

movement into MSEA during the mid-Holocene from what is today China (Higham 2014; Rispoli 2007), they lack specific temporal control on localized pulses of Neolithic expansion, exactly how wild and domesticated resources were partitioned into diets, what type(s) of agriculture and horticulture were practiced, and how migrating Neolithic populations interacted with indigenous hunter-gatherer groups. Some regions throughout MSEA, particularly Vietnam, have a more well-established record of this Neolithization process, but portions of the interior, especially Laos, Cambodia, regions of Thailand, Myanmar and Peninsular Malaysia, have very little clear evidence.

Considering that the main domesticated plant and animal resources that eventually become staples of the MSEA diet – rice, millet, cattle, pigs, and chickens – are native to MSEA, it is critical to understand how the process of the forager-to-farmer transition occurred within this region. Establishing if there was a long-term relationship between hunter-gatherers and agricultural groups will help provide more detailed insight into the Neolithization process and this critical transition. Similar to the issues confronting the Hoabinhian, an important reason why archaeologists lack detailed information on the forager-to-farmer transition in many regions of MSEA (e.g., Thailand) is that sites with potential transitional records, for example, at Non Nok Tha (Bayard 1970), were excavated in the immediate post-World War II era without modern techniques and with different excavation goals (i.e., emphasis on metallurgy). Future research aimed at documenting the forager-to-farmer transition will undoubtedly help clarify and establish this record.

Metallurgy and Complex Societies

Although hominins, hunter-gatherers and the Neolithic transition are important issues in MSEA archaeology, one of the most significant debates today surrounds the emergence and timing of the advent of metallurgy, the emergence of complex societies, and broad-scale social changes during the Bronze Age and afterwards (Higham et al. 2011; White and Hamilton 2009). Related debates primarily focus on two sites in northeast Thailand, Ban Chiang and Ban Non Wat, and to a lesser degree, Non Nok Tha. The direct dates, context, and associated cultural artifacts for the earliest metal-bearing deposits at each of these sites differ markedly from each other. Since identifying the exact timing, process(es), and scale of metallurgical development has profound impacts on understanding long-term sociocultural processes within MSEA, it is no surprise that this issue continues to spur intense debate. What is clear from the evidence currently available is that the emergence of metal producing and metal using societies within MSEA differed between sites, both in its "arrival" (or appearance in the archaeological record) and functional use and purpose. Metals likely played multiple different roles within these agricultural communities, and this fluctuated through both time and space. Thus, as archaeologists continue to investigate important questions surrounding the emergence of metallurgy and increasing societal complexity (based on hierarchical, wealth, and status differences), it will remain necessary to contextualize these arguments within regional understandings of the diversity of mid- to late-Holocene agricultural communities throughout MSEA.

International Perspectives

Based on my own experience as an American citizen and archaeologist, there is increasing interest and consideration of the MSEA archaeological record in Western and global anthropological and archaeological discourse. The breadth of indigenous archaeological scholarship in MSEA is growing, and this provides a powerful new narrative on archaeological histories and perspectives from this region. During the pre- and immediate post-World War II eras, archaeology in MSEA was largely nonindigenous and dominated by Western researchers excavating and publishing archaeological findings based on their own ideas and interpretations. To their credit, many of these early archaeologists established strong relationships with their fellow collaborators and archaeologists within MSEA countries. Examples are easy to identify – both Chester Gorman

(an American archaeologist who excavated at Spirit Cave) and Donn Bayard (an American archaeologist who excavated at Non Nok Tha) have longstanding reputations highlighting their close relationships and collaboration with, in these cases, Thai scholars, archaeologists, and local communities. However, this has not always been the norm and because of this, and several other reasons (including language barriers), the archaeology of MSEA is still somewhat unknown to most American and Western scholars. Sites of major importance, Spirit Cave for example, are known worldwide but often by name only. The complete scope and scale of the archaeological record in this region has yet to be understood by most non-MSEA archaeologists. This situation will likely change as indigenous, American, and other archaeologists around the world continue to study MSEA archaeology. For example, ongoing Thai excavation and research projects directed by Dr. Rasmi Shoocongdej at Long Long Rak in northwest Thailand and by Ms. Supamas Duangsakul in western Thailand at the site of Nong Ratchawat hold excellent potential to redefine our understanding of the prehistoric hunter-gatherer and Neolithic records, respectively, within MSEA. This ongoing research is especially important given recent acknowledgement of the complexity and importance of MSEA as a pivotal center for human evolution and adaptation in the tropics.

Future Directions

I expect the future of archaeology in MSEA to include two major factors: (1) establishment of new international collaborations by indigenous archaeologists within MSEA and (2) detailed scientific analyses of legacy collections. As archaeological research continues within MSEA, it is likely that there will be a major transition in the type of research conducted. In the past, many research projects in MSEA were conducted by, mostly, Western archaeologists who included MSEA archaeological collaborators and co-directors. I expect that as future research occurs within MSEA, the opposite effect will become the norm – indigenous archaeologists will conduct research projects and will include nonindigenous archaeological collaborators and co-directors. The shift in the design and implementation of research projects will undoubtedly influence this, and the next generation of archaeologists, and will provide an entirely different narrative and perspective on the complex archaeology of this region (White 2017).

Alongside this change in the function of archaeological research within MSEA, I expect a renewed interest in previously excavated legacy archaeological assemblages. Although legacy collections are commonly burdened by missing contextual information (e.g., missing field notes, photographs, poor artifact curation), they also provide the opportunity to gain detailed information on prehistoric cultural activities using fine-grained scientific analyses. For example, innovations in radiocarbon dating, ancient DNA analysis, multiple stable isotope compound specific analyses, and 3D morphometrics now provide the opportunity for enormous information gain from, in some cases, individual artifacts. As scientific analyses of legacy collections continue, there will likely (and should) be a parallel effort in providing open-accessibility to data, results and interpretations, and reproducible results to allow archaeologists from all backgrounds and regions to reconstruct analyses and understand the minutia of site and artifact specific investigations.

With these future directions in the archaeology of MSEA, we are undeniably on track to identify new trends and patterns in the prehistoric cultural record, clarify and answer unresolved key issues and debates, and continue making significant discoveries that will influence our understanding of hominins on a global scale.

State of Knowledge and Current Debates

Edo and Meiji Period Antiquarianism and the Roots of Japanese Archaeology

Archaeological research has a very long tradition in Japan. The first pioneers of archaeology started studying objects from prehistoric and protohistoric periods in the seventeenth century. The Edo period (1603–1868) was a period of national isolation and very few contacts to other countries; however, it was also a period of cultural prosperity when art and scholarship flourished. During this time, Confucianism had a renaissance, and the study of history was regarded an essential part of this philosophy. Neo-Confucianism encouraged people to think rationally and to make objective observations. This led to the popular study of strange geological and archaeological objects by Neo-Confucian scholars and lay people. These early scholars also published and described their collections and research.

Tokugawa Mitsukuni (1628–1700) had two burial mounds excavated to investigate their links to a local chief, Kuni no Miyatsuko, who had been mentioned in written sources. Tokugawa Mitsukuni was thus the first scholar to use excavation as a scientific method to aid his research on historical periods (Bleed 1986; Sugiyama and Saitō 2008). Arai Hakuseki (1657–1725) was the first person in Japan to state that stone arrowheads did not fall from the sky, as was the common belief during that time (Ikawa-Smith 1982). He understood that these objects were man-made and had been manufactured by people of bygone ages. He even knew sites where those objects could be found. Hakuseki, and also Tō Teikan

History of Archaeology in Japan, Fig. 1 Publication of Kofun period horse gear by Tō Teikan (Shūkozu 集古図 Vol. 4, from the collection of the National Diet Library)

(1732–1797), a Buddhist monk, denied the existence of an "Age of Gods" that was recorded in the ancient chronicles and developed theories of immigration routes through which people from the Eurasian mainland might have entered the Japanese islands (Fig. 1). Gamō Kumpei (1768–1813) provided the first overview of the structural evolution of burial mounds and was the first to use the term *zenpōkōenfun* (前方後円墳, tomb with a square front and circular back) as a term to describe keyhole-shaped tombs, a term still used in modern archaeology (Bleed 1986; Sugiyama and Saitō 2008). Kiuchi Sekitei (1724–1808) was a lay person interested in geological and archaeological objects. He founded the National Club for Stone Lovers (*roseki no sha* 弄石の社, lit. "Rock Fondlers") where people met and discussed objects from their collections (Sugiyama and Saitō 2008). The club was thus similar to modern academic societies and early forms of museums, such as the European cabinets of curiosity where unusual objects were collected and displayed.

Meiji Period

With the beginning of the Meiji Period (1868–1912), enormous changes occurred in Japan. After the end of the closed country policy (sakoku and Kanji: 鎖国) of the Edo period, Japan was being modernized with rapid speed; the same is true for Japanese archaeology. As early as 1871, the Japanese government passed a law to protect historical records, collections, and finds (*koki kyūbutsu hozon-hō* 古器旧物保存方). The following year, the Tōkyō Imperial Museum was founded. The museum immediately started acquiring newly excavated objects, such as the spectacular burial goods of the Eta Funayama tomb that had been excavated in 1873. To simplify and smoothen the process of adding objects to the collection, the Law of Regulations for the Handling of Lost Articles was passed in 1876

(*ishitsubutsu toriatsukai kisoku* 遺失物取扱規則). According to this law, the state could claim objects if it was impossible to determine their original ownership. Another law to protect the cultural heritage followed in 1897 when the Law for the Protection of Ancient Shrines and Temples (*koshaji hozon-hō* 古社寺保存法) was passed (Edwards 2008). In 1873 the government had begun to publish an encyclopedia about Western science, art, and culture (Nakai 2005). The word and the subject of archaeology were introduced to Japan for the first time in 1877 in a book named *The Study of Ancient Objects* (*kobutsugaku* 古物学) that was published as part of this encyclopedia that dealt with the research of ruins, excavation, and documentation. With this publication, archaeology was being acknowledged as an independent science for the first time (Nakai 2005; Saitō 1974). The political change brought some advantages for the development of the Japanese archaeology but also some disadvantages and restrictions for archaeologists. In 1874 the "reckless" excavations of Kofun period burial mounds had been prohibited, and this prohibition lasted until the end of the WW II. This governmental directive to refrain from excavations did not always deter the locals from opening tombs. In some cases, looting resulted in criminal prosecution; but in most cases, it did not have any consequences. Conversely, Tsuboi Shōgorō, an anthropologist and one of the most important figures of Meiji period archaeology, was reprimanded by the government for excavating the Uma-ga-take tomb (Fukuoka Prefecture) in 1888. He had excavated several tombs before without encountering problems; but after the caution, he ceased to investigate tombs altogether (Edwards 2008; Saitō 1974). The reason for the restriction of research on certain archaeological periods (mainly the Yayoi period and the Kofun period) was the state religion of Shintō which centered on the emperor. The highly mythological ancient Japanese chronicles became one of the main sources for this religion. Since Kofun period burial mounds were believed to be the graves of the ancestors of the emperor, their excavation was forbidden. Only research about the Jomon period was regarded as safe because it was thought that the Jomon people had been indigenous people with no ties to the current Japanese population and had been conquered by the imperial family after they had descended from heaven to the Japanese islands. On the plus side, Meiji legislation also ensured the preservation of more than 300 historical sites that were thought to be connected with the history of the imperial family (Edwards 2008; Fawcett 1996b), albeit for ideological rather than scientific reasons.

As in the preceding Edo period, archaeological research was done by individuals with no or little formal training in archaeology. Nevertheless, these scholars engaged in archaeological activities on a scientific level and laid the foundations for academic organization and infrastructure of Japanese archaeology.

In 1884, Tsuboi Shōgorō (1863–1913) founded the Anthropological Association of Tōkyō and was involved in the founding of the Archaeological Society in 1896. This was the first society in Japan where archaeological topics were discussed on a scientific level; Negishi Bunko (1831–1902) was another important pioneer of Japanese archaeology during the Meiji Period. In 1887, he became the first chairman of the just founded Society for the Collection of Old Things (*shuukokai* 集古会). The founding members of this society also belonged to the Anthropological Association of Tōkyō and the Archaeological Society. In this society, collectors, interested lay people, and scholars met to discuss objects of their private collections. Even though the society was oriented more toward popular science, its importance for the development of Japanese archaeology should not be underestimated (Bleed 1986; Nakai 2005).

The opening up of Japan during the Meiji Period provided Western scholars with a chance to enter the country. Some of them showed an interest in pre- and protohistoric Japan and engaged in archaeological research. German collector Heinrich von Siebold was probably the first to do so. He came to Japan in 1869 as an interpreter for the Austrian-Hungarian embassy. Just like his father, Philipp Franz von Siebold, he was interested in archaeological objects. In 1873, he first sent prehistoric stone objects from Japan to

the Danish National Museum. He published his archaeological research in 1879 in both English (*Notes on Japanese Archaeology with Especial Reference to the Stone Age*) and Japanese (*kōko setsuryaku* 考古説略, translated by Yoshida Masaharu). The English book contains a number of plates with photographs of stone tools, ritual stone objects, Jōmon pottery, beads, and Kofun period haniwa clay statues. The Japanese version contains an introduction to European archaeology. He is credited for first using the term *kōkogaku* (考古学 archaeology) which is still used today. Nevertheless, his various activities had very little impact on the development of Japanese archaeology itself (Hirata 2008; Kreiner 1980; Sahara 2004).

The American biologist Edward Sylvester Morse (1839–1917) came to Japan in 1877 to teach at Tōkyō University. Even though he had not studied archaeology, he was an avid amateur archaeologist and had gained some excavation experience in New England. He discovered the Ōmori shell mound on his way to Tōkyō and obtained the permission to conduct an excavation there. Today he is credited with conducting the first scientific excavation in Japan at the Ōmori shell mound, but he was not the only excavator (Bleed 1986). In 1880 Siebold had again sent stone objects to the Danish National Museum and stated in their description that they had been found in a shell mound between Tōkyō and Yokohama. It is therefore very likely that he investigated the Ōmori shell mound shortly before or after Morse conducted his excavation. In fact, a note on Morse's planned excavation by Tōkyō University explicitly states that other parties interested in the shell mound should not be permitted to excavate to avoid the scattering of the archaeological material (Sahara 2004). In 1879 Morse published a detailed excavation report in both English and Japanese, describing and illustrating the finds. He dated the excavated objects into the prehistoric period without making any references to ancient Japanese chronicles. This is remarkable because Morse thereby introduced the term and the concept of prehistory to Japanese scholars. He furthermore used the term cord-marked pottery to describe the pottery found in the Ōmori shell mound and therefore coined the term *jōmon* (縄文 cord-mark) that became the term for a whole archaeological period (Bleed 1986).

William Gowland came to Japan in 1872 as one of the many Western specialists who were tasked with aiding the modernization of Japan. Gowland was a chemist and metallurgist with a great interest in archaeology. He was employed at the Imperial Japan Mint in Ōsaka, first as a chemist and later as an assayer. He traveled all over Japan to visit archaeological sites, focussing on Kofun period burial mounds. His surveys of these tombs were extensive and surpassed everything that had been done by Japanese scholars. He measured the tombs, photographed them, recorded their shape and their orientation, and would even make scale drawings. In 1878 he excavated the Shibayama tomb (Kawachi, Ōsaka prefecture), a small keyhole-shaped mound, with the permission of the local governor. He made a detailed record of the finds, drew a layout map of the burial chamber, and meticulously collected even the smallest items. He used a grid system during his excavation to make sure he would be able to record the exact location of every object. His excavation is therefore one of the very few well-documented excavations of a burial mound during the Meiji period. He classified the tombs according to their shape and the burial chambers according to the shape and size of both the main burial chamber and the corridor leading to the chamber. In 1888 he returned to England with a large collection of Kofun period artifacts that is now exhibited in the British Museum. In 1899 and 1907, he published two papers on Japanese burials mounds in English (The Dolmens and Burial Mounds in Japan and The Dolmens of Japan and their Builders). The quality of the publications, his research, and interpretations of the archaeological material were exceptional for an amateur archaeologist (Harris 2003; Ōtsuka 2003). These publications which could have had an enormous impact on Kofun period archaeology in Japan were unknown to Japanese academic community until their translation in 1981, almost a hundred years after his time in Japan (Ueda 2003). But while his research gained only little recognition in Meiji period Japan, his huge collection and his records are a valuable resource today and are still

analyzed by archaeologists. His photographs are of great value still because he was able to enter the grounds of some imperial tombs before access was restricted (Harris 2003; Ōtsuka 2003).

Siebold, Morse, and Gowland have all been called founders or father of Japanese archaeology, but this is clearly an overestimation of their importance and the impact of their activities. Siebold was just a collector with an amateur interest in archaeology who lacked formal training. He also lacked Morse's connections to the academic world and had to finance all investigations by himself which put him at a considerable disadvantage. Gowland also had no contact to the academic world in Japan, and no Japanese scholars were involved in his investigations. He published detailed records of his research and the tombs he had visited. For the early development of Kofun period archaeology, his research played no role. Morse's activities had the greatest impact on the development of Japanese archaeology. His position as professor at Tōkyō University provided him with opportunities the others did not have. The introduction of introduced modern Western excavation methods and scientific terms for the finds and periods were his most important merits. These terms replaced the mythological names that had been used before by some pioneers of the Japanese archaeology. He also was in contact with Japanese scholars like Negishi Bunko and shared his knowledge with his students (Ōtsuka 2003; Sahara 2004). The real fathers of Japanese archaeology, however, are the Japanese scholars engaged in archaeological research during the Edo and Meiji period.

Taishō Period and Early Showa Period Archaeology

Despite the ongoing political restrictions for archaeologists, the Taishō period and the early Showa period are of great importance for the development of the Japanese archaeology. During this time span, the way for modern archaeology was paved. Archaeology became established as an independent subject at universities, and excavations became a common tool. Japanese archaeologists refined their methods, and their research resulted in a rapid sophistication of chronology and typology. The number of professional archaeologists increased steadily during this time. Archaeology had become acknowledged as a science rather than the hobby of a few.

In 1919 and 1929, two new laws for the protection of sites and cultural properties were passed that superseded the Meiji period legislation. First, the Law for the Protection of Cultural Monuments and Natural Landmarks (*shiseki meishō tenzen kinenbutsu hozon-hō* 史蹟名勝天然紀念物保存法) was introduced that protected archaeological sites as well. The Law for the Protection of National Treasures (*kokuhō hozon-hō* 国宝保存法) followed. This law broadened the scope of sites and objects that were to be protected (Edwards 2008).

The most important figure for the establishment of scientific archaeology was Hamada Kōsaku (1881–1938). He had studied at Tōkyō University, and from 1909, he began to teach the first archaeology courses in Japan at Kyōto University. From 1913 to 1916, he studied archaeology in Europe under the British archaeologist Flinders Petrie at University College London. Petrie was one of the first Western archaeologists to recognize the importance of stratigraphic excavations. He was aware that the sequence of archaeological layers could be used to date the objects found within these layers. He also realized the necessity for careful documentation of the excavation itself. Hamada learned all these methods from Petrie, and after his return to Japan, he published the first book about archaeological methods and theories with the title *Tsūron Kōkogaku* 通論考古学 (Introduction to Archaeology; Fig. 2) in 1922. In 1916, upon his return from Europe, he became the first professor for Japanese archaeology at Kyōto University. Until 1937, he conducted several excavations which were published in 14 volumes (Edwards 2008; Kanaseki 2004).

He brought Western methods and theories to Japan and made them available for a wide public via his Japanese translations. He also was the first professor of the first Department of Archaeology in Japan, at Kyoto University, and can therefore be called the first modern Japanese archaeologist.

History of Archaeology in Japan, Fig. 2 Tsūron kōkogaku (from the collection of the National Diet Library)

Other notable scholars of this first period of scientific archaeology are, for example, Yamanouchi Sugao (1902–1970) whose intensive research about the Jōmon period resulted in a first chronological framework for this period, Morimoto Rokuji (1903–1936) who founded the founded the Kōkogaku Kenkyū-kai (Archaeological Society) which later became the Tōkyō Archaeology Society in 1927, and Matsumoto Hikoshichirō who stressed the importance of stratigraphic excavations and their importance for the dating of finds (Bleed 1983).

Colonial Archaeology

The end of the Meiji period marked an important turning point for Japanese archaeology. The government recognized the potential that archaeological research had for legitimating its aggressive expansionism on the Eurasian mainland. In 1904, with the start of the Russo-Japanese war, first articles about race and war were published in the Journal of the Tōkyō Anthropological Society. Tsuboi Shōgorō was among the researchers who wrote articles to justify the military activity. His article "Anthropological Contemplation of War" (*sensō no jinruigaku-teki kansatsu*, 戦争の人類学的観察) was published in April 1904, just 2 months after the war began (Tsuboi 1904; Saitō 1974). However, the involvement of Japanese archaeologists with the nationalist imperial propaganda was not limited to academic publications. Anthropologist Torii Ryūzō traveled to Taiwan and other regions to photograph the local indigenous population. He compared facial tattoos of Taiwanese women to patterns on Jōmon and Yayoi pottery and human-shaped haniwa, concluding that the people of Taiwan had descended from the Japanese (Pai 2009). With the occupation and annexation of the Korean Peninsula and the establishment of a colonial government (*Chōsen Sōtōku-fu* 朝鮮総督府), archaeological research and excavations began there as well. The colonial government even had a special branch for archaeology that conducted excavations in, for example, Kyŏngju and Pyŏng'yang. Several very influential early archaeologists were active on the Korean Peninsula and also China, among them, Hamada Kōsaku (Kyōto Imperial University), Harada Yoshito (Tōkyō Imperial University), and Umehara Sueji (Kyōto Imperial University). The aim of this archaeological research was intimately connected to the imperial ideology. In 1927, Hamada, Harada, and Ma Meng from the Archaeological Society of Peking University founded the East Asian Archaeological Society (*Tōa Kōko Gakkai* 東亜考古学会) that officially was aimed to promote joint research in East Asia but surely was also meant to aid the exploits of the colonial archaeologists (Miyamoto 2017; Sakazume 1994).

In Korea, Japanese archaeologists had the opportunity to excavate large-scale burial mounds that contained grave goods very similar to the ones known from tombs in Japan. While the excavation of such tombs was forbidden in Japan to avoid conflicts with the written sources and imperial ideology, the tombs on the Korean Peninsula

were excavated and interpreted according to these same written sources to prove that Korea had been a part of Japan in ancient times.

Archaeology After WWII

The end of WWII and the subsequent abolition of imperial ideology were a liberation for Japanese archaeology. The restrictions for researching certain periods and sites ended, and Japanese archaeology was faced with the enormous task to fill the void that the imperial ideology had left (Edwards 2008).

Even though Japanese archaeologists had been heavily involved in questionable research on the Eurasian mainland to legitimize the aggressive expansion of the Japanese empire, domestically, archaeology is generally thought to have survived these periods ideologically untainted. The heavy restrictions for archaeological research in Japan aided this positive perception of Japanese archaeology.

Archaeology was in the spotlight of public attention during the postwar period and was tasked to provide a picture of Japanese prehistory and protohistory based on scientific methods, scientific analysis of the excavated material, and unbiased by written sources. By 1948, only 3 years after the war, 109 excavations had already been conducted. Public funds and trained archaeologists were still scarce, so many of the excavations were privately funded and executed by lay people or archaeology clubs of public schools (Fawcett 1996b; Saitō 1974). The earliest large-scale excavation occurred immediately after the war, in 1946/1947, when five Japanese universities jointly excavated the Toro site in Shizuoka prefecture. During this excavation, rice fields associated with a prehistoric settlement were excavated for the first time. A picture of a peaceful farming society that had lived on the Japanese islands was created to provide a contrast to the militarism of the past decades. The discovery got large press coverage and brought the importance of site conservation to the attention of the Japanese public. Even though such huge excavation projects were the exception in the immediate postwar period, media coverage steadily rose and resulted in a high level of public interest for archaeology. Public attention and the postwar construction boom led to a substantial increase of public funds for archaeological projects (Fawcett 1996a, b).

In 1948, the Japanese Archaeological Association was founded to provide the people engaged in archaeological activities in Japan with the means to collaborate and to discuss their research on an academic level. This was a huge step toward a centralized infrastructure for Japanese archaeology and marked the end of the decentralized and individual research that was typical for early archaeological activities in the prewar era (Ishikawa 2017).

Archaeology in the 1950s and 1960s

In 1950, Japan became a pioneer for modern protection of archaeological heritage by passing the Law for the Protection of Cultural Properties (*bunkazai hogo-hō* 文化財保護法) that was administered by the Commission for the Protection of Cultural Heritage (since 1968 called Agency of Cultural Affairs, *Bunkachō* 文化庁). In 1954, this law was amended to ensure the protection of archaeological sites during the construction boom accompanying postwar development. But even with this amendment, several sites were destroyed by construction activities without prior scientific excavation. Therefore, a second amendment was passed in 1959 and the costs-by-cause principle became part of the law. This progressive amendment provided the authorities with the necessary funds to conduct rescue excavations because the costs were transferred to the companies responsible for the construction and subsequent rescue excavations. The amendment furthermore excluded important sites from construction development. These new laws and guidelines furthermore resulted in the first national database for archaeological sites that had already 35.000 entries in 1962 (Kobayashi 1986; Tsuboi 1992; Okamura 2004). A problem in the immediate postwar era was that many of the construction projects for housing and transportation were conducted by the state on state-owned land. One branch of the government thus destroyed archaeological sites that another branch was trying to protect. The construction of

infrastructure was a priority, and the Commission for the Protection of Cultural Heritage was unable to enforce the law against uncooperative bigger ministries (Barnes 1990).

Japanese archaeology in the 1950s and 1960s was characterized by a dominance of Marxist theories in archaeological thought, such as historical materialism, and an extensive participation of lay people in archaeological excavations and research (Fawcett 1996b). The first Marxist interpretations of archaeological material appeared in the 1920s, at a time when Marxism had a large following among Japanese intellectuals (Ikawa-Smith 1982). Marxists were among the few who had criticized the imperial government and its politics. In the postwar era, it was therefore considered to be untainted by the imperial ideology and experienced a renaissance (Gayle 2003). Public participation was strongly supported by the academic community – especially by the numerous Marxists among the Japanese academics and intellectuals. The public was encouraged to explore their own history and the history of their local communities by taking part in academic activities and discussions (Fawcett 1996b). A particular highlight of this movement was the excavation of the Tsukinowa tumulus in 1953 in the Okayama Prefecture. The excavation was supervised by archaeologist Kondō Yoshirō but funded by the local community. Furthermore, 10,000 local people volunteered to participate in the excavation. They were encouraged to critically analyze the finds in order to make them question the former imperial ideology and mythological history (Kondō 1998; Muraki 2011). This kind of archaeology has been dubbed "public archaeology" or "citizen excavations" and is practiced in Japan until today (Muraki 2011). Other large projects include the excavation of the Miharashidai site (Aichi prefecture) that has continued for almost 40 years. Each year, volunteers can participate in the excavation, and the project aims to interest the local population in their cultural heritage. In the early and middle 1990s the project had a record participation of 600–700 volunteers each year (Muraki 2011).

The various interactions of academics and the public resulted in a heightened awareness and interest for archaeology and cultural heritage. The establishment of archaeology clubs at schools, such as the club at the Tōhō University High School that was founded in 1963 (Yamagishi 2016), or the establishment of citizens' action committees to fight for the preservation of archaeological sites (Fawcett 1996b; Tsuboi 1992, 1998) are clearly a result of the movement – as are the student protests of the 1960s when students demonstrated, violently at times, against rescue excavations, and the destruction of archaeological sites for construction development (Fukuda 2007). This radical movement wanted to preserve all sites regardless of their importance (Kobayashi 1986). The protests against the destruction of important sites led to the establishment of a government project to preserve areas with large concentrations of sites in 1966. This project was called Fudoki no Oka (風土記の丘). The original intention was for each prefecture to select an important historical or archaeological site and build a museum close to the site. These museums are tasked with the maintenance of the site and the explanation and promotion of the importance of the site to visitors (Tsuboi 1992). Many of these Fudoki no Oka have been constructed close to tomb clusters, thus overly focussing on only one period. This and the unimaginative, generic design of the museums and the surrounding park areas have been criticized as damaging for the reputation of the project (Tsuboi 1986). The selection of important sites regardless of their location has resulted in the construction of museums in remote areas that are hard to access for potential visitors. But regardless of all criticism, Fudoki no Oka such as the Chikatsu-Asuka Museum and the Saitobaru Archaeological Museum are known for the appealing, modern design of their permanent exhibitions and their excellent temporary exhibitions. Until today only 16 prefectures have implemented the project.

It was not just student protests and public attention that provided challenges for Japanese archaeology though. The rapidly increasing number of rescue excavations revealed serious issues on the most basic structural level of archaeological organization. In the period immediately after the war, rescue excavations were conducted by the

History of Archaeology in Japan, Fig. 3 Excavations in Japan 1960–1978. (After Tsuboi 1986)

universities, but by the 1960s, the number of necessary rescue excavations surpassed the number of academic excavations. In 1960, only 198 rescue excavations and 143 academic excavations were conducted in Japan. By 1969, the number of rescue excavations had almost quadrupled to 745, while the number of academic excavations had not even doubled (Fig. 3) (Tsuboi 1986). In fact, the number of necessary rescue excavations was so large, that the universities had to capitulate. They lacked the personnel to conduct all of these excavations. Moreover, the archaeologists at the universities themselves were critical of the destruction of the sites by rescue excavations and the dire conditions under which these excavations had to be conducted. Archaeologists such as Yoshirō Kondō began to refuse to conduct rescue excavations in order to force the Commission for the Protection of Cultural Properties to take a stance against these worrisome developments (Barnes 1990).

Due to the shortage of qualified staff and insufficient experience in rescue excavations, the costs exploded, while excavation reports remained unpublished, and thousands of finds were not properly analyzed (Tsuboi 1986). At the same time, universities were not able to meet the demand for new qualified archaeologists. In the early 1970s, archaeology could be studied at only 15 universities meaning that there was a lack of trained archaeologists (Okamura 2004).

Archaeology in the 1970s and 1980s

The Japanese government tried to counter the problems with rescue excavations by establishing centers for archaeological heritage management (Centres for Buried Cultural Properties, maizō bunkazai sentā 埋蔵文化財センター) that were tasked with the excavations and publication of reports. These centers were established on both prefectural and municipal level and hired their own archaeologists and specialists. In addition to

excavations, they are also responsible for the storage of the excavated material and usually have exhibition rooms where some of the finds are displayed. Some of the centers later became partly privatized nonprofit foundations funded by government grants. These foundations are responsible for rescue excavations on the prefectural level until today (Kobayashi 1986; Barnes 1990).

The influence of Marxism waned in this period because social conditions changed. The postwar economic growth resulted in higher wages, and more Japanese began to consider themselves being middle rather than working class. Historical Materialism had been used as a theoretical framework to study the development of prehistoric societies and thus affirm Marxist theories and politics of the Japanese communist party. This meant analyzing and interpreting finds in a wider, supra-regional context (Mizoguchi 1997). During the 1960s and 1970s, the first students of archaeology that had grown up in the postwar period graduated. They were raised in the time of the postwar construction boom and the ever-rising number of rescue excavations. Many of them probably felt as part of the newly developed middle class. Marxism and Historical Materialism were incompatible with the realities of their personal life and working life. Many started to work at the newly established foundations and were busy with rescue excavation on a local level. They did not have the time to fit these sites into a supra-regional context. With the demise of Marxism in Japan, Marxist archaeology became obsolete.

This framework was not replaced and left a theoretical vacuum, though. Archaeological research was largely reduced to revising and editing existing typological chronologies and the accumulation of finds and data. Comprehensive excavation reports were published, but the sites were rarely analyzed within a supra-regional context. The absent theoretical framework caused a lack of theorizing and discussions of the archaeological material. Japanese archaeologists were furthermore reluctant to participate in the discussion of theoretical and ideological issues that took place in Western archaeology (Habu 1989; Mizoguchi 1997).

The development of archaeology in the 1970s was shaped by spectacular finds such as the murals of the Takamatsu-zuka tomb and the inscribed sword from the Sakitama Inariyama tomb which resulted in a huge increase in media coverage. The tourism industry seized the opportunity to commercialize the large public interest. Asuka and Kashiwara (in Nara prefecture) were promoted as places where the traditional Japan could still be experienced. A law from 1966 to preserve the historical environment of former capitals (*koto hogo-hō* 古都保存法) was expanded and prompted the establishment of specially protected areas where the construction of new buildings and the alteration of the existing environment where heavily restricted. While highly unpopular with the local population who saw this law as a hindrance for the modernization of their communities and feared to be overrun by tourists, this law aided the endeavors of the tourism industry. Fears of the locals proved to be justified, and in 1970 the Ishibutai tomb site was visited by 3000 people on a single day. The rush of visitors increased with the establishment of two archaeological national parks (Iwaido and Ishibutai) and the Asuka Historical Museum (Fawcett 1996a).

The government used this atmosphere to utilize archaeology for its own purposes once again. It was the time of the emergence of a new line of research in Japan: the *Nihonjin-ron*. This theory was the result of governmental efforts to create a national identity based on the supposed cultural uniqueness and homogeneity of the Japanese people. The creation of a perceived uniqueness was an endeavor by the government to dissociate Japan from the West in a more and more globalized world. The public interest and huge media coverage were used to underline the fictional uniqueness of the Japanese people and to create the myth that the Yayoi and Kofun people were the direct ancestors of the Japanese. Influences from the Eurasian mainland and the role of immigrants during the pre- and protohistoric periods were downplayed. Some of the archaeologists themselves were complicit in spreading this distorted picture of prehistoric Japan (Fawcett 1996a; Kaner 1996).

Archaeology in the 1990s

The 1990s were the golden age of Japanese archaeology. While the Japanese economy struggled to recover from the collapse of the bubble economy of the late 1980s and early 1990s, the number of conducted archaeological surveys/excavations and available funds soared to previously unimaginable levels. In 1996 almost 12,000 rescue excavations were conducted. Academic excavations, rescue excavations, and preliminary surveys combined resulted in 41,880 archaeological investigations in that year. The budget peaked a year later, in 1997, when 132 billion yen (approx. 1.1 billion Dollar) were available for rescue excavations (Fig. 4). By the end of the 1990s, over 7000 archaeologists were employed in Japan. Of these archaeologists 90% were engaged in rescue excavations, and only a very small minority was employed at universities, research institutes, or museums and doing academic research (Bunkachō 2008; Yajima 1997).

The steady increase in rescue excavations and the ensuing increase in jobs for archaeologists were an opportunity for university graduates to get a lifetime position in one of the foundations responsible for buried cultural properties; however, work duties strongly differed from what many applicants expected. At the universities, research was stressed as the main task of an archaeologist. By contrast, working for the foundations meant much administrative work and less research. The basic structure of these foundations is similar to corporations. Archaeologists working for these foundations have the difficult task to be specialists and efficiently working managers at the same time. Their duties furthermore include negotiations with the construction companies concerning necessary rescue excavations, leaving

History of Archaeology in Japan, Fig. 4 Budget for rescue excavations 1973–2012. (After Bunkachō 2014)

archaeologists in a conflict of interest: they earned money with conducting recue excavations, which led to a destruction of the archaeological sites, while their main task should be preserving these sites (Mizoguchi 1997).

Since the 1970s, universities had tried to satisfy the increasing demand for archaeologists. While in 1970, only 13 universities offered archaeology as a field of study, the number had risen to 30 universities by the end of the 1970s and 68 in the mid-1990s. In 1979, 256 archaeology students graduated, and in 1994 the number had increased to 314. While this was certainly an increase, it was definitely not enough to satisfy the increasing demand for qualified personnel which had more than quadrupled in the same time (Okamura 2004). The massive increase in rescue excavations and preliminary surveys, therefore, did not result in an equally massive increase in student numbers.

Archaeology in the Twenty-First Century

The height of Japanese archaeology came to an abrupt end in 2000. A scandal surrounding amateur archaeologist Shin'ichi Fujimura and his team shattered public trust in archaeological research. Fujimura, a specialist for Paleolithic archaeology, was photographed by the newspaper Mainichi Shimbun while burying objects in the ground. These exact objects were later to be presented as spectacular finds. Fujimura became infamous for constantly making finds that pushed the date of first human settlement on the Japanese islands farther and farther until it reached 600,000 BC. Investigations by the Mainichi revealed an archaeological fraud of previously unimaginable proportions. Since the 1970s, Fujimura and his team had faked archaeological features in 108 cases and had buried much younger Jōmon period (12,000–500 BC) objects in Paleolithic layers. Decades of forgery were possible because the documentation of the excavations did not comply with professional standards. The objects were dated according to the stratigraphic layer they were found in, and no typological analyses were made to confirm their age. The academic community and the mass media also contributed to the fraud by unquestioningly agreeing with the results from Fujimura and his team (Inada 2004; Miyashiro and Yonehara 2010). There were attempts to draw the attention of the academic community to discrepancies between the presented objects and the proposed dating by some very few archaeologists. As early as 1986, Charles T. Keally and Oda Shizuo published an article criticizing the excavation methods, the dating, and the analysis of the objects. They pointed out that the assigned dates did not match the geological strata, the circumstances of the discoveries were suspicious, and that some of the objects might be just geofacts – but were ignored by the academic community (Oda and Keally 1986). The reason why a hoax this big went undiscovered for so long is rooted inside seniority-based academia. Younger scholars are expected to agree with the work of older and more experienced scholars. Criticism and discussion of research are not encouraged. This tradition, which is clearly unsuited for academia, prevented the discussion of these finds that would have been vital to put an early end to Fujimura's forgeries. After the scandal, Japanese Paleolithic research had to restart from scratch, and it took Japanese archaeologists years to rebuild public trust.

The budget for rescue excavations and the number of archaeologists employed in Japan steadily decreased since the turn of the century, while the number of archaeological investigations has continued to increase. In 2012, over 55,000 archaeological investigations were conducted; approx. 8000 of them were rescue excavations (Fig. 5). Academic excavations amounted for less than 1% (434) of these investigations. While in 1996 a budget of approx. 125 billion yen were available to deal with more than 41,000 archaeological investigations, in 2012 less than half of that (approx. 55.5 billion Yen) had to suffice to deal with a much larger number. The decrease of qualified personnel was less drastic. In 2012, 5,868 archaeologists were employed in Japan, and that number even increased in 2013 for the first time in 10 years (Fig. 6) (Bunkachō 2014).

Shintarō Shiina, specialist for the Japanese heritage preservation laws, has recently pointed out two problems arising from the decrease of

History of Archaeology in Japan, Fig. 5 Excavations in Japan 1976–2012. (After Bunkachō 2014)

archaeologists employed by the government. The specialists employed by the government in the 1960s and 1970s are nearing the age of retirement and need to be replaced. Young Japanese, however, are reluctant to accept the harsh working conditions that have characterized these jobs until now. Another problem is the outsourcing of not only specialist activities such as aerial photography and object preservation but the whole excavation process to private excavation companies. This trend began in the 1980s, and today 20% of all preliminary surveys are already carried out by private companies (Shiina 2016).

In 2008 the Agency for Cultural Affairs (Bunkachō) had identified a serious problem in regard to private excavation companies. Cost reduction was the main concern for local governments when choosing private excavation companies. In some cases, these companies were not able to finish the work they were contracted for because their tightly calculated budged was not sufficient and the local government had to take over. The result was not a cost reduction but a cost increase for the local governments (Bunkachō 2008; Shiina 2016).

Several other problems have arisen with the widespread outsourcing of excavations. Employees of private excavation companies were found to lack expertise and were unable to recognize regional characteristics of sites and finds. Local governments reduced their professional staff as part of their austerity measures and outsourced excavations. This left them without trained specialists to evaluate or oversee the work of the private companies. This causes a decline of expertise on handling excavations and cultural properties at the local governments (Bunkachō 2014; Shiina 2016).

Despite the severe cuts, Japanese archaeologists still think that the positive development of Japanese archaeology is continuing (Suda 2012).

In the recent years, natural disasters such as the Great East Japan Earthquake in 2011 and the earthquake in Kumamoto Prefecture in 2016

History of Archaeology in Japan, Fig. 6 Employed archaeologists in Japan 1971–2013. (After Bunkachō 2014)

have challenged Japanese heritage management and Japanese archaeology with the task to preserve damaged cultural properties and conduct a large number of rescue excavations while the communities are being rebuilt. This has also led to a surge in public participation. Efforts to rescue damaged cultural properties were aided by 6800 volunteers in the years after the Great East Japan Earthquake (Okamura 2017; Tate'ishi 2014). These natural disasters also resulted in increased activity in archaeological sub-disciplines such as earthquake archaeology and tsunami archaeology. These aim to investigate disasters in archaeological record and the human reactions to such disasters (Barnes 2017). Disaster archaeology is a developing field, and new discoveries in this area might even prove useful for future prevention of such disasters and the planning of disaster response measures (Okamura et al. 2013).

Conclusion

The history of Japanese archaeology is long and varied. Internal research as well as external influences has shaped its development. The extensive archaeological activities in Japan and the huge public interest in archaeological heritage are the

reason for the outstanding position of Japanese archaeology on a global scale today.

Nevertheless, there are some serious problems that need to be tackled. One of the issues in Japanese archaeology surely is the overwhelming domination of male archaeologists, while female archaeologists are disproportionately underrepresented; this is especially true for senior positions. This issue is not limited to archaeology or academia but the whole Japanese labor market. Young female scholars often spend much longer times in junior academic positions and are less likely to get promoted. There is also a huge gender gap for married women with children which are less likely to get promoted than men in comparable positions. A second problem is the scarcity of English publications that would make Japanese archaeology accessible for scholars outside Japan which has been criticized for decades, but until today only few improvements are visible. A handful of individual researchers have published articles and introductory literature, but the majority of works on archaeology in Japan is still published in Japanese only. English abstracts in Japanese journals remain the exception. Large and important journals such as *Gekkan Kōkogaku Jānaru* and *Kikkan Kōkogaku* still don't include English abstracts, while the Journal of the Japanese Archaeological Association is one of the few notable exceptions. The situation is similarly dire when searching for English abstracts in excavation reports. The accessibility of Japanese excavation reports is a general problem. These publications are often circulated only locally and cannot be purchased in normal bookstores or online stores. The situation has greatly improved since the Nara National Research Institute for Cultural Properties (Nabunken) has launched the *Comprehensive Database of Archaeological Site Reports* in Japan in 2015. Old and new site reports are provided as PDFs for any interested researcher for free, and almost 21.000 PDFs are online as of February 2018. The number of accessible site reports greatly varies from prefecture to prefecture; there are currently no excavation reports from prefectures such as Tōkyō and Fukushima and only five to ten reports from prefectures such as Kyōto and Tochigi. But even though there is an English version of the website, the site reports remain mostly Japanese only and are thus useful only for the handful of archaeologists that are able to read Japanese. The establishment of the English language *Japanese Journal of Archaeology* in 2013 is surely a step in the right direction, and it is to be hoped that these projects will lead to a greater internationalization of Japanese archaeology.

The History of the Research of Amazonian Dark Earths in Brazil

Lilian Rebellato
Archaeology, University of Western of Para, Santarem, Pará, Brazil

Introduction

Many of the archaeological sites in Amazonia contain Amazonian Dark Earth (ADE). Characterized by anthropogenic melanization because of the accumulation of organic materials, especially charcoal, coupled with a host of nutrients,

these soils also contain a high quantity of archaeological material, mainly ceramics and some lithics, moreover, all sorts of animal and human bones, feces, and house/garden waste (Woods and McCann 1999). Through their habitation activities, these past people unintentionally put nutrients into the soil, bringing micro- and macronutrients from food, fuel, and building material to the sites of their habitations, where their use and disposal contributed to change the soil's properties.

The ADEs are found in different types of soils, including Latosols, Podsols, Podzolic, and Plinthosols (Smith 1980; Kern et al. 2004), and generally found in the Pleistocene terraces. They are well-known for their high fertility and resilience, with almost neutral pH, high cation exchange capacity (CEC) and base saturation, and high levels of macro- and micronutrients for plants in both available and/or total measurements, including phosphorus (P), calcium (Ca), zinc (Zn), copper (Cu), magnesium (Mg), manganese (Mn), and carbon (C) (Sombroek 1966: 174–178). Sombroek (1966) also observed a variation in these anthropogenic soils. He called attention to lightly melanized (brown-hued) soils with few archaeological materials in the matrix, found dispersed concentrically in surrounding areas with *terra preta* (TP), and he denominated these lighter soils *terra mulata* (currently called *terra marrom* – TM, namely, brown hue color). TM is considered the result of intentional agricultural field improvements. The microbiological composition of ADE is responsible for their resilience, for the high activity level of their microorganisms makes them expand and grow (Woods 1995).

According to Denevan (1996: 669–670), *terra preta* and *terra marrom* are indirect evidence of intensive *terra firme* cultivation in permanent or semipermanent fields. According to the author, ancient villages in the Amazonia were surrounded by cultivation with fruit orchards, managed fallows, house gardens, and brief bush fallows with semipermanent settlements, some numbering thousands of people, surrounded by zones of modified forest manipulated by hunting and gathering activities (Denevan 1996). This viewpoint expresses a very different vision than that of Meggers, who argued for settlement discontinuities due to soil exhaustion and continual reoccupations of the same site through time (e.g., Meggers 1954). In support of Denevan's stance, research carried out in the lower Tapajós and Arapiuns drainages has identified very large ADE sites with different densities of archaeological materials whose distribution is suggestive of habitation middens associated with areas formed by long-term agricultural activities (Woods and McCann 1999), and similar results have been found in the Central Amazon (Heckenberger et al. 1999; Rebellato et al. 2009; Stenborg et al. 2018).

Although the white-water floodplains are composed of fertile soils, they also contain important risk factors for food production due to the annual flooding periodicity (Denevan 1996: 656). While the uplands are characterized by weathering and poor soils, they do have the advantage of not being flooded annually and consequently were considered a good place to build villages and house gardens according to archaeological records (Denevan 1996). Through their habitation activities, these past people unintentionally put nutrients into the soil, and through these activities they started to generate the Amazonian Dark Earths (Woods and McCann 1999).

Historical Background

The first records of ADE appeared in the Brazilian Amazon; the investigations of anthropogenic ADE have a historical relationship with Natural Science research during the first explorations by naturalists and geologists in the second half of the nineteenth century, such as James Orton, Orville Derby (1875), and Charles Hartt (1885). They reported the presence of black soils in

Taperinha (a farm built by North American immigrant who came to Brazil after the end of their civil war). The records also point out the presence of ADE in Diamantina, and Itaituba cities. In 1903 Friedrich Katzer not only recognized the fertility of those soils but also suggested that the previous inhabitants in the Amazon were responsible for the creation of the soils. He also was the pioneer in applying chemical analysis to soils in abandoned settlements for fertility tests, methods not applied again in Amazonia until Sombroek (Woods and Denevan 2009).

A more detailed survey of the *terra preta* from the anthropological point of view started during the first decades of the twentieth century, with the ethnoarchaeological research conducted by Curt Nimuendajú, who made maps with the dark soils' distribution and conducted excavations in the Tapajós region (1953). Nimuendajú, with the collaboration of Erlan H. Nordenskiöld, director of the Göteborg Museum in Sweden, amplified the collection of ethnoarchaeology artifacts for the museum from South America. During the 1940s and the 1950s, the fertility of the *terra preta* (TP) was assumed to be due to natural processes, although it attracted people to the specific places where they were found. Initially, TP fertility was hypothesized to be the result of nutrients from the floor of an extinct lake or an effect of volcanic ash deposition (Falesi 1974). Woods and Denevan (2009) have divided the second half of the twentieth century into the "pre-Sombroek" and "post-Sombroek" periods (1966), with Sombroek being the godfather of the *terra preta*.

Sombroek (1966) dismissed the idea of a natural formation process of the ADE through a three-pronged analysis that produced three significant findings: (1) the clay fraction is the same of the surrounding soils (predominantly kaolinite); (2) the texture is the same in and out of TP; and (3) the C horizon always presents the same characteristics as the other soils in the region (Sombroek 1966: 176). These findings sparked research about anthrosols in Amazon. He also proposed a model of occupational systems, where the TP (*terra preta*) is interpreted as a result of kitchen-midden deposition and TM (*terra marrom*) as the effect *of long-lasting cultivation from gardens around the past villages* (Sombroek 1966: 175). However, through the model of occupation that Meggers supported for Amazonia, the ADE was understood as a consequence of short reoccupations of a site through time, responsible for the genesis of thick and wide deposits of anthrosols due to the partial overlapping of occupations. The major contributions in archaeological research during the following decades were associated with the investigations developed by PRONAPABA (*Programa Nacional de Pesquisas Arqueológicas na Bacia Amazônica*), led by Meggers, which located numerous sites of ADE (1954).

Nigel Smith (1980) reopened the discussion of dark soils and pre-colonial populations with a current well-known paper describing the physical and chemical characteristics of these anthrosols that also propelled the heated debate concerning Amazon occupational systems. According to Smith, the ADE was related to large, dense, and permanent village occupational systems, instead of small groups with a re-occupational settlement strategy. Smith also stimulated a review of standard notions of the carrying capacity of the forest, calling for attention to the resilience, nutrient availability, microorganisms, and vegetation of the TP (*terra preta*) (Smith 1980: 562).

In Brazil, a group led by Marcondes Lima da Costa and Nestor Kämpf started to work with ADE in the 1980s, producing influential discussions about the associated settlement patterns, geochemistry, site formation processes, classification analysis, and mapping of these anthrosols (Costa and Kern 1999; Kämpf et al. 2009). During the middle 1990s, the University of São Paulo in association with the University of Vermont and University of Florida through Eduardo Neves, Michael Heckenberger, and James Petersen started to

look at the ADEs as the result of long and permanent settlement during pre-colonial times (Heckenberger et al. 1999).

In Colombia in the late 1970s and 1980s, Bray, Eden, Herrera, and McEvans identified many sites in the middle Caquetá Basin, archaeological sites related to ADE in the Colombian Amazon. Through a comparison of similarities between those anthrosols and the TP in Brazil, they recognized a regional pattern of anthrosol formation process in the Amazon as an effect of settlement intensification in the region (Eden et al. 1984). Following this line of investigation, Cavalier, Herrera, Mora, and Rodrigues observed that in an attempt to increase the food production in the region at the Araracuara archaeological site (Caquetá River), around 800 AD the population added alluvial silt in order to increase the soil fertility, thereby generating TP (Mora et al. 1991).

In Germany, the University of Bayreuth became a center of ADE studies thanks to Wolfgang Zech, who led the research about the fertility of TP and its holding capacity for nutrients (Zech et al. 1990). Pabst (1991) analyzed the content of OM (organic matter) and found a concentration six times higher than that of surrounding soils. Glaser et al. (2001) investigated the OM and black charcoal from incomplete combustion in the ADE, concluding that their effects were responsible for its fertility (Glaser et al. 2001). Lehmann added that inputs of charcoal in soils increase the nutrients available for plants while also decreasing the leaching of P, K, Ca, and Zn (Lehmann et al. 2003).

In North America, Bill Woods publish his first article about ADE and a short time after, at the University of Wisconsin a group formed that included professors and students led by William Denevan (1996), increasing the amount of knowledge and fieldwork focusing on ADE. Woods and McCann (1999) boosted the development of new research aimed at studying the formation process of anthropogenic soils, and its relation to pre-colonial settlements and their agricultural practices.

Distribution of ADE

The ADEs are found in several locations in Amazonia, and with the increase of research in the area, certainly more sites will be found in other locations and different contexts. Woods and McCann identified ADE sites along the rivers, in the uplands, and on bluffs; near water sources and not; and associated with both sandy and clayey soil matrices (Woods and McCann 1999: 8). Current baselines of research allow us to say that ADE area found at different types of soils, and these are usually less than 2 ha in size, but a few of them are more than 100 ha. ADE sites are found in every ecological zones and landscape in the Amazon Basin, and it covers around 0.1–0.3% or 6000–18,000 Km^2 of the total Amazon Basin (Kämpf et al. 2009; Woods and Denevan 2009). The majority of the ADE is found along the bluffs of the main rivers or abandoned river channels in the *terra firme* (non-floodable area) (Denevan 1996; Kern et al. 2004).

Current Debates

Due to the high fertility of ADE, they are currently used by the local populations for agricultural purposes and present a model for sustainable soil resource development in the tropics. Therefore, the study of the Amazonian Dark Earths is important to understand the past, and it also represents key knowledge for the present and future of the biggest tropical forest in the world. The Brazilian government's political agenda calls for development of portions of Amazonia, as well as expansion of its agricultural and development infrastructure ventures, increasing the population density and pressure on resources in this region. An effort is needed in order to protect the archaeological sites in the region, moreover increasing the studies about ADE and its geneses. Thus, the ADEs are an interesting research object and have been examined by a multidisciplinary group consisting of archaeologists, anthropologists, biologists,
